**Recent sewage investigation in Maryland.** ABEL WOLMAN. *Public Works* 63, No. 4, 29(1932).—A trickling filter was treated with 25 p. p. m. Cl in an attempt to remove the humus. The treatment was applied for 9 consecutive days. No lab data are yet available but considerable material was removed from the filter stones. Baltimore has adopted the lime-Cl treatment for the sewage-plant effluent. Lime fed by dry-feed machines is carried in aq. suspension to the point of application of the Cl An alk $Ca(ClO)_2$ soln. is thus formed and applied to the plant effluent The required ratio of 1.25 parts lime to 1.0 part Cl is checked by phenolphthalein tests. Less Cl is required, and the residual is more permanent. Expts. are being made with a "Genter" type pilot scale oscillating, continuous-vacuum filter. The ripe digested sludge is coagulated with $FeCl_3$ at a $p_H$ of 4.8. Moisture of the dried sludge is 75%. C. C. RUCHHOFT

**Jersey City's Boonton sewage plant.** ANON. *Public Works* **63,** No. 2, 40(1932) C. C. RUCHHOFT

**Sewage-treatment plant at London, Ont.** W. M. VEITCH. *Can. Eng.* **62,** No. 18, 11–16(1932).—This activated-sludge plant is designed to treat a flow of 5 million gal per day. Both coarse and fine screens are used, and all screenings are pressed and incinerated. Spiral-flow aeration tanks provide a detention period of 1.8 hours. Settling tanks are equipped with scrapers of the twin-spiral type. The fine screens remove an av of 9% suspended solids having a moisture content of 87%. The final effluent contains 50 p. p. m. suspended solids, which is a 72% removal. E. HURWITZ

**Unusual features of sewage treatment at Bradford, England.** ANON. *Public Works* **63,** No. 8, 12(1932).—Special treatment was designed for a domestic sewage strongly polluted with wool-scouring waste. Wool fat is removed by adding $H_2SO_4$

until the $p_H$ of the sedimentation tank effluent is 6. Acid is added only when wool suds are being received at the plant. Sludge from the detritus and pptn. tanks is placed in vats where it is heated with steam coils, to facilitate removal of the grease by means of sludge presses. Sludge cake is hauled to the drying beds. Tank effluent is treated on filters using hard Yorkshire coal as a filtering medium. Its use on the filters has not resulted in any loss of calorific value C. C. RUCHHOFT

**Sewage purification in Glasgow.** W. J. TENNAUT. *Surveyor* **81**, 609–10(1932); *U. S. Pub. Health Eng. Abstracts* **12**, S, 122(Nov. 19, 1932).—The Dalmarnoch works were originally designed for chem. pptn. but were later improved by the addn. of trickling filters. They cover 28 acres and treat 20,000,000 gal. a day of an exceptionally complex sewage contg. much trade waste. The Dolmuir works employs chem. pptn. and treats 40,000,000 gal. per day. The Shieldhall works, treating mostly weak domestic sewage of 30,000,000 gal. per day, also use chem. pptn. followed by fine screening. Sludge disposal is effected partly by pressing and partly by disposal at sea. C. R. FELLERS

**Sewerage and sewage disposal of Marlow.** G. T. COTTERELL. *Surveyor* **82**, 111–12(1932); *U. S. Pub. Health Eng. Abstracts* **12**, S, 131–2(Dec. 10, 1932).—The plant was designed to care for a population of 6200. The sewage is discharged from 2 ejector stations before entering the 2 vertical 2-story sedimentation tanks of 90,000 Imp. gal. capacity. The effluent liquor from the sedimentation tank passes into a dosing chamber from which it is automatically and intermittently dosed through revolving distributors onto 3 primary percolating filters with a total capacity of 2670 cu. yds. The effluent from the filters passes into 2 vertical hopper-type humus tanks. Secondary filtration from a dosing chamber to 2 percolating filters follows in a similar manner, the effluent passing onto 2 horizontal-flow shallow secondary-humus tanks before discharging into the river. There are 2 sludge-digestion chambers with capacities of 3490 and 1260 cu. ft., resp. The sludge may be moved from the sedimentation tanks either to the digestion tanks or direct to the sludge lagoon. C. R. FELLERS

**Sewage-disposal plant and trunk sewers at Brampton, Ont.** W. M. TREADGOLD. *Can. Eng.* **62**, No. 26, 19(1932); cf. *C. A.* **26**, 4117.—This plant treats a flow of 0.5 million gal. per day of combined sewage. E. HURWITZ

**Design and operation of dual interceptors and sewage-treatment plants.** G. W. WHITE. *Am City* **47**, 63–5(1932); *U. S. Pub Health Eng. Abstracts* **12**, S, 131(Dec. 10, 1932).—The rept. is based on the Spartanburg, S. C., plant. C. R. FELLERS

**Grease removal from Los Angeles sewage.** ANON. *Public Works* **63**, No. 2, 49(1932). C. C. RUCHHOFT

**Non-biological sewage and sludge treatment.** WILLEM RUDOLFS. *Public Works* **63**, No. 9, 23–4(1932).—The method consists of displaceable tanks filled with slag. The coarse-screened sewage is filtered upward through the slag, the partially clarified sewage is pptd., settled and filtered through the same slag. Rapid sand filters must be used to obtain a highly purified effluent, but a 70% reduction of suspended solids and a 60% reduction of biochem O demand has been obtained. The slag is removed when fouled, and the adhering sludge is incinerated at a temp. of 1200°F. About 2% of the slag is lost at each drying and burning. Trouble from odors has not been entirely eliminated. C. C. RUCHHOFT

**Determination of carbon in sewage and in sludge.** H. BACH. *Z. anal. Chem.* **91**, 259–63(1933).—C in the dried sludge from treated sewage is detd. by wet combustion with chromic and sulfuric acids and absorption of the resulting $CO_2$ in a soda-lime tube. Since bicarbonates and $NH_4$ carbonates are lost during the evapn. and drying of the sludge the C found corresponds quite closely to what is called "organic" C. The method can also be applied to the detn of C in sewage which has been evapd. to dryness. In this case, if the sewage has been treated with CaO, considerable $CaCO_3$ is likely to be present in the residue, so that a sep. detn. of carbonate C must be made by treating with acid alone. W. T. H.

**Incineration of sewage screenings and sludge.** HERBERT W LINCOLN. *Public Works* **63**, No. 5, 22–4(1932).—In order to operate a properly designed incinerator without nuisance, the temp. of the outgoing gases must be 1250°F or above, and there must be an ample supply of air. The choice of com. fuel depends upon local conditions, but oil is preferable, since it combines ease of firing and temp control. Proper incinerator design should include a large hearth area, multiple charging and stoking holes, provision for thorough mixing of the gases with air and a settling chamber for the removal of ash particles from the gases. C. C. RUCHHOFT

**Present status of activated-sludge process.** WELLINGTON DONALDSON. *Public Works* **63**, No. 4, 24(1932).—The activated-sludge process is assuming a dominant position for large plants, since it is feasible to supplement the process by chlorination or filtration. Because of fluctuations in plant loading and difficulties of control it is not so well adapted to small projects. Suspended solids in aerating tanks

range from 0.10 to 0.70% by weight. To clarify data the following factors should be expressed on a per capita basis or in terms of a stated no. of units of O demand: detention period in aeration tanks, air used per gal. and h. p. per million gal. In spiral-flow aeration tanks and in mech. types, short circuiting is an important factor. Possible deoxygenation should be prevented. Reaeration is advisable for some situations. Sludge bulking is more serious in the smaller plants. Sludge disposal by the use of heated digestion tanks and drying beds is recommended. The use of vacuum filters has been found feasible. The manuf. of fertilizer from the filter cake is not a com. success. Attention is being given to incineration as a means of filter-cake disposal. C. C. R.

**Activated-sludge process in small installations.** F. M. VEATCH. Mo. Water and Sewage Conference, *6th Ann. Rept.* 85–9; *U. S. Pub. Health Eng. Abstracts* **12,** S, 109(Oct. 8, 1932); cf. *C. A.* **26,** 5363.—Even in small installations the activated-sludge process has proved both efficient and economical of operation. C. R. FELLERS

**Placing the Woonsocket activated-sludge plant in operation.** ILBERT O. LACY. *Public Works* **63,** No. 5, 25–7(1932).—By means of an addnl. channel located across the effluent end of the aeration tanks it is possible to return poor sludge to the skimming tank. The sewage flow includes industrial waste from rayon, wool scouring, piece dye and weaving mills. A large amt. of grit necessitates a max. air supply in the skimming tank, and this causes more grease on the surface of the preliminary settling tanks than is desirable. A heavy fibrous mat is occasionally formed on the surface of the same tanks This is pumped to a sand filter, drained and buried. An activated sludge floc of 2000 p. p. m. was quickly built up. Primary sludge and activated sludge were pumped to the digestion tanks with sufficient lime to maintain a $p_H$ of 7.2 Operation and cost-data tables are included. C C. RUCHHOFT

**Separate sludge-digestion works at Wichita, Kansas.** F. M. VEATCH. *Am City* **47,** 58–9(1932); *U. S. Pub. Health Eng. Abstracts* **12,** S, 130-1(Dec. 10, 1932), cf. *C. A.* **26,** 5363.—The sewage works is designed for an estd. population in 1940 of 160,000 and a flow of 18,000,000 gal a day It consists essentially of mechanically cleaned bar screens, grit chamber, aeration tank, settling tank, sludge digesters and sludge-drying beds. After passing through the screens the sewage is aerated by means of air forced through porous plates for about 20 min. before settling. Duplicate settling tanks are provided with scrapers and skimmers. The settled sewage passes through a Venturi meter in the outfall line. Three digesters are provided with a total capacity of 320,000 cu. ft. The digesters are heated by sep. gas-fired boilers A scum-breaking mechanism is used. The gas collected in the domes of each digester is piped to a 25,000 cu. ft. tank. The plant includes 36 sludge beds with a total area of 108,000 sq. ft. The sludge is to be used for fill. C. R. FELLERS

**Equipment employed in recovering sludge from settling tanks.** EDMUND B BESSELIEVRE. *Can. Engr.* **63,** No. 5, 11(1932). E HURWITZ

**Fertilizer base from sewage sludge.** C. G WIGLEY. *Water Works & Sewerage* **79,** 76(1932); *U. S. Pub. Health Eng Abstracts* **12,** S, 125(Nov. 19, 1932); cf. *C. A.* **26,** 2538.—The method of conversion depends upon the action of fungi on the sludge An inodorous, stable fertilizer base is thus obtained at the Atlantic City sewage works C. R. FELLERS

**Salamanders and water hygiene.** WM. G. HASSLER. *Natural History Magazine* **32,** 303–10(1932); *U. S. Pub. Health Eng. Abstracts* **12,** W, 140(Dec. 3, 1932).—Salamanders in several N. Y. state water supplies normally contained *Es. coli* in their intestinal tracts. This finding raises a new problem in water sanitation. C R. FELLERS

**Typhoid fever epidemics from water supply in Germany.** HAYO BRUNS. *J. New Water Works Assoc.* **25,** 1–18(1933). D. K. FRENCH

**Indexes of the sanitary quality of swimming-pool water.** M. P. HORWOOD, B S GOULD AND H. SHWACHMAN. *J. Am. Water Works Assoc.* **25,** 124–35(1933).—Some index of quality other than *Es. coli*, should be employed. The total count at 37° is considered the best and most simple. The blood-agar plate test for hemolytic streptococci should be included. There is no relationship between *Es. coli* and streptococci in general. The residual chlorine should be maintained between 0.3 and 0.5 p. p. m. D. K. FRENCH

**Process for the oxidation by means of air of hydrogen sulfide in solution.** M KAPP. *Bull. soc. encour. ind. nat.* **131,** 649–54(1932); cf. *C. A.* **26,** 4398.—Modifications in the original installation are described, consisting in effecting addn. of the $NiSO_4$ at a point where rapid and complete mixing with the effluent takes place. The effluent treated consists of wash water from the scrubbers used for purifying producer gas, and a continuous system has been devised for reusing the water in the scrubbers; this consists essentially in removing S and NiS by filtration, converting $H_2SO_4$ into $BaSO_4$

by passing through a layer of $BaCO_3$, and removing $BaSO_4$ by sedimentation and decantation. Cost figures are given showing an estd. expense of 37 francs per 24 hrs. for treating 100 cu. m. of effluent with $NiSO_4$ and reuse of the water, as compared with 240 francs for Javel water treatment and use of fresh water. As the effluent contains an appreciable amt. of O which can oxidize the $H_2S$ and thus give low results in the detn. of the $H_2S$, the following method is used, which gives accurate results, even when considerable time elapses between the taking of the sample and the carrying out of the detn.: On taking a measured vol. of sample immediately add excess of 20% $CdSO_4$ soln.; when ready to make the analysis, transfer the sample completely to a flask provided with a 2-hole stopper through one of which passes a long-stemmed, stoppered, funnel tube and through the other a tube connected to a vertical, small-bore, spiral condenser opening under the surface of a measured vol. of standard I soln.; add a few pieces of pumice stone, heat to boiling, slowly add 100 cc. of a mixt. of equal vol. of water and 66° Bé. $H_2SO_4$, distil for 10 min. after disappearance of the yellow color of CdS, and titrate the soln. in the receiver with standard $Na_2S_2O_3$. ## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

**Modern applications of chemistry in agriculture.** E. John Russell. *Sci. J. Roy. Coll. Sci.* **2**, 47–57(1932). E. H.

**Iodine in Kentucky soils, limestones, waters and forage crops.** J. S. McHargue. Ky. Agr. Expt. Sta., *44th Ann. Rept.* 24(1931); cf. *C. A.* **26**, 4891.—The I content of soils and rocks is extremely variable. Soils of Eastern Ky. contain about $^1/_2$ as much as those of the blue-grass region. In some very poor soils, no I was found. *Watercress* is unusually rich in both Mn and I. C. R. Fellers

**Soil survey of the Salachi area, Suiyuan Province, China.** Robert L. Pendleton, L. C. Ch'ang, W. Chen and K. C. Hou. Geol. Survey China, *Soil Bull.* No. 4, 26 pp. (1932).—Analyses are included. E. J. C.

**The silt soils of Picardi and their real state of fertility.** Georges Joret. *Ann agron.* [N. S.], **2**, 170–98(1932); cf. *C. A.* **26**, 4663.—Clay content, $p_H$, exchangeable bases, lime, the ratios of sol. humus-total N and of organic matter-sol. humus; assimilable phosphoric acid and potash; lime, phosphoric acid and potash requirements and total N were detd. and their significance was discussed. F. W. Marsh

**Pan [Nasas] and its origin in the red sandy soils of Palestine.** Felix Menchikovsky. *J. Agr. Sci.* **22**, 689–703(1932).—Palestine Pan, "Nasas," is found in the coastal plain among red sandy soils which represent an unstable soil system and one subject to the process of degradation. Observations on this soil in relation to relief show the transportation of colloidal clay, $Al(OH)_3$ and $Fe(OH)_3$ along the slope and downward. The ratio of $Al(OH)_3$ to $Fe(OH)_3$ shows a relatively large downward transportation of the former; and this increase of $Al(OH)_3$ in the lower layers of the soil is the chief factor in the formation of impermeable layers. The compn. of the layer beneath "Nasas" shows an increase in total sesquioxides with depth, greater transport of $Al(OH)_3$ compared with $Fe(OH)_3$, and a sharp increase in the percentage of colloidal matter. It is concluded that "Nasas" is the end degradation stage of red sandy soil. The colloidal portions transported downwards are composed of complex particles and the products of their hydrolysis. The conditions favoring formation of "Nasas" are the easy permeability of red sandy soil, lack of $CaCO_3$ and a soil relief with the character of sand dunes. The process is similar to that of podsol formation but under conditions of a semi-arid climate and without the accumulation of humus. The state of dispersion of fine particles of zeolite depends chiefly on the initial charge of the complex particles and on the concn. of $Ca^{++}$ in the soln. The particles peptized by one concn. are coagulated by another concn. of Ca. The formation of red sandy soils and their degradation can be explained by the influence of the Ca cation which is present in soln. in varying amts. P. R. Dawson

**Soil mapping on the basis of color and consistency.** R. Brink. *Arch. Suikerind.* **40**, III, *Mededeel. Proefsta. Java-Suikerind.* 1479–538(1932).—Soil mapping must satisfy the following requirements: the soil types to be characterized must be "natural" types in order that the classification may be of direct use in plantation practice; the maps must give sufficient detail; the system must be uniform; the mapping must be done as rapidly and cheaply as possible. None of the systems used heretofore has fulfilled all these requirements at the same time. The color and consistency of the soil, detd. on briquets pressed from the soil samples by comparison with standard samples, permit a satisfactory classification, and the results correlate well with other soil properties which are more difficult to measure directly. The mapping is done very rapidly by mass work. The prepn. of the maps is described, and several maps are shown. Examples of correlations between soil types and fertilizer needs are given. This inductive method of soil mapping may also be combined with the deductive genetic method, and a better insight into the significance of soil differences obtained. F. W. Z.

**The chemical composition of the soils of the Hungarian Great Plain. III. Conditions of alkalinization.** Sándor Arany. *Mezögazdasági Kutatások* **5**, 243–68 (in English 268–70)(1932).—Two processes work against each other, regradation and degradation. The regradation is stopped a short distance under the surface. Regradation can be observed mostly on alkali soils contg. $CaCO_3$ either on or near the surface. Before reclamation of soils it should be decided whether regradation or degradation is present. S. S. de Finály

**Plant association conditions and acidity of forests covering Norwegian Lapland.** DÁNIEL FEHÉR. *Math. naturw. Anz. ungar. Akad. Wiss.* **48**, 581–624(in German 625–30)(1931).—Soil samples ranged between $p_H$ 5 and 6. The seasonal changes observed during the examn. of $p_H$ data of Hungarian forests can also be applied to the podsol soils of North Europe. S. S. DE FINÁLY

**Saline soils.** LEO POZDENA. *Chem. Erde* **7**, 441–72(1932).—This report gives complete results of an investigation of 6 profiles of unproductive soils, including 2 immature soils of low salt content and 4 transition soils in which degradation phenomena are manifested in the migration of humus and the sesquioxides as well as in morphology. The effect of the dispersion agent ($Li_2CO_3$) on the results of mech. analysis depends upon the soil type and on the salt content. Soils rich in clay are characterized by a high viscosity; those rich in alk. salts are compactly bedded and have great swelling capacity. The soils, all with $p_H > 9.0$, were rich in carbonate and contained 0.6–0.8% (about 4% in the crust) of water-sol. salts. The greater part of the sol. material was incombustible. W. L. HILL

**Nitrogen recuperation in the soils of the Bombay Presidency. III.** D. L. SAHASRABUDDHE AND N. V. KANITKAR. *Indian J. Agr. Sci.* **2**, 455–83(1932); cf. *C. A.* **26**, 2539.—A study was made of the recuperation of N under field conditions in the dry arable soils of the Bombay Deccan. Addn. of org. matter in the form of farmyard manure or *sann* (*Crotalaria juncea*) increased the recuperation power of the soil and maintained the N content at a fairly high level, recuperation being assisted by cultivation of the soil. The max. increase in total N occurred at a time when the soil moisture was about 20% and the soil temp. approx. 30°. Cultivation and addn. of org. matter gave rise to 2 maxima in nitrate-N production which were directly useful for the growing crop. Fallowing had a similar effect on nitrate production. The nitrate content varies with the type of soil, the org. matter and CaO content and the moisture, temp. and aeration of the soil. K. D. JACOB

**New methods for the chemical examination of soil.** MENKE. *Der Naturforscher* **8**, 385–8; *Wasser u. Abwasser* **30**, 44(1932).—The acidity of soil is detd by shaking samples with NaOAc and with KCl and titrating with 0.1 *N* NaOH. F. P. G.

**Mechanical analysis of lateritic soils.** JOGENDRA NATH CHAKRABORTY AND ASHUTOSH SEN. *Indian J. Agr. Sci.* **2**, 516–24(1932).—Efficient and reproducible dispersion of Indian lateritic soils was obtained by shaking 20 g. of soil with 500 cc. water and 6–8 cc. *N* NaOH (so that the suspension has a $p_H$ of about 10.5) for 24 hrs. in an end-over-end shaker. For soils contg. more than 2% org. matter, $H_2O_2$ treatment should precede the shaking with NaOH, and the loss by soln. of sesquioxide, etc., should be detd. and added to the figure for clay. Dispersion with NaOH gave results for silt and clay that were almost identical with those obtained by dispersion with $Na_2CO_3$ according to the Sudan method, or by dispersion with NaOH after treatment with HCl according to the international method without $H_2O_2$ treatment. The direct NaOH method is less laborious for the mech. analysis of lateritic soils. K. D. J.

**Investigation of field soils according to the rapid method of Dirks.** GOLLING. *Pommernbl., Amtsbl. Landw.-Kammer Pommern* **34**, 38(1931); *Phosphorsäure* **2**, 192.—The Mitscherlich and Dirks methods for available $P_2O_5$ were compared on 461 soils, qual. agreement between the methods being obtained in 88% of the cases. In 238 soils the methods gave results for available $K_2O$ which agreed in 74% of the cases. The results by the Dirks method agreed best with those obtained in 12-year field expts. K. D. JACOB

**The new rapid methods for determining the nutrient content of field soils.** ESCHENHAGEN. *Pommernbl., Amtsbl. Landw.-Kammer Pommern* **34**, No. 28(1931); *Phosphorsäure* **2**, 380.—A study of approx. 10,000 soil samples by the Dirks method showed that the subsoil is much poorer in $P_2O_5$ than the surface soil. In sandy loams the subsoil contained more $K_2O$ than the surface soil. K. D. JACOB

**The nutrient content of Pfälze vineyard soils.** M. KLING. *"Wein u. Rebe,"* No. 10(1931); *Phosphorsäure* **2**, 255.—The majority of the soils are alk. and are high in CaO. Tests on 142 samples by the Neubauer method showed that 50% of the surface soils and 88.5% of the subsoils were deficient in root-sol. $P_2O_5$. Likewise, 42.2% of the samples were deficient in root-sol. $K_2O$. Vineyard soils contg. less than 15 mg. root-sol. $P_2O_5$ and 50 mg. root-sol. $K_2O$ per 100 g. are considered deficient in P and K. K. D. JACOB

**The mobility of nutrients in the soil in relation to its cultural condition.** N. S. AVDONIN. *Chemisation Socialistic Agr.* **1**, No. 2, 47–61(1932).—Expts. show that in sod chernozem soils the nutrients are immobile. After a legume crop the soil is lacking in P and enriched with N, thereby responding more to P fertilization. The Ca from the lower horizon in connection with legume culture ties up a lot of P. Nutrients attain their highest mobility under fallow and the losses of artificial fertilizers added

are considerable. The various types of fallow influence the mobility and the losses of nutrients in a different way. J. S. JOFFE

**Determination of nitrogen in soils. I.** A. SRINIVASAN. *Indian J. Agr. Sci.* **2**, 525–30(1932).—Figures for total N obtained by the usual dry digestion of soils with $H_2SO_4$ are invariably lower than those obtained by digestion after wetting. The best results seem to be obtained by moistening at the rate of 20 cc. of water per 5 g. of soil, then adding concd. $H_2SO_4$ and allowing the mixt. to stand overnight prior to digestion. The available evidence indicates that the oxides of Fe and Al interfere with the detn. by the usual dry digestion method. K. D. JACOB

**The influence of temperature on the nitrate content of soil in the presence of decomposing cellulose.** JAMES E. FULLER AND LINUS H. JONES. *Soil Sci.* **34**, 337–51 (1932).—Soil low in org. N was depleted of nitrates at all temps. when treated with cellulose. Addns. of $CaCO_3$ caused less depletion of nitrates but $CaSO_4$ had little effect. Cellulose added to a soil rich in org. N caused a depletion of nitrates for a time, but later showed little effect when the expts. were carried out at 25°. A temp. of 35° was more favorable than 25° for the maintenance of nitrate concn. Crop response shown by the growth of tomato plants followed essentially parallel with the nitrate values. M. S. ANDERSON

**Unusual accumulation of soil nitrates in 1931.** J. W AMES. Ohio Agr. Expt. Sta., *Bull.* **516**, (*51st Annual Rept.*) 31–2(1933).—Soil nitrates were studied during the 5-yr period 1928–32. Up to 1931 the nitrate N in the surface 6⅔ in. of soil under corn or soy beans never exceeded 50 lb. per acre. In 1931, following the drouth year, max. values under corn and soy beans were, resp., 225 and 300 lb. C. R. F.

**Causes of low nitrification capacity of certain soils.** G. S FRAPS AND A. J. STERGES *Soil Sci.* **34**, 353–63(1932).—Many soils which do not nitrify $(NH_4)SO_4$ may produce some nitrates from the soil N. Such soils may usually be caused to nitrify $(NH_4)SO_4$ by the addn. of $CaCO_3$ or of a culture of an actively nitrifying soil or both. Addns. of inoculating liquid alone produce little nitrification. Soils of high nitrifying capacity after sterilization often produce more nitrates with the same quantity of inoculant than soils low in nitrifying capacity Nitrite organisms may produce considerable nitrates from $(NH_4)_2SO_4$ when nitrate producers are very inactive. There is a close correlation between nitrifying power and the nos. of nitrifying bacteria present in a soil at the beginning of an expt. M. S. ANDERSON

**Carbon and nitrogen cycles in the soil. VII. The nature of the organic nitrogen compounds of the soil: "humic" nitrogen.** R. P. HOBSON AND H J PAGE. *J. Agr. Sci.* **22**, 497–515(1932); cf. *C. A.* **26**, 3598.—Purified prepns. of humic acid from Rothamsted soils contained over 5% N, in confirmation of previously recorded results. This N could not be eliminated by successive soln. in alkali and reppn. with acid, dialysis, ultrafiltration, or salting out with satd. NaCl, which methods should remove simple N impurities. Either N is an integral part of the humic acid mol. or it is present as colloidal compds., the diffusibility of which is of the same order as that of humic acid, and which are pptd. by acid or form an adsorption complex with humic acid in acid soln. The N distribution of HCl hydrolyzates of such humic acid prepns., as detd. by the Van Slyke method, resembled that of a typical protein hydrolyzate. The presence of approx. half of the humic acid N as amino N indicated that the greater part of the N is present in some polypeptide form. A mixt. of egg albumin and artificial humic acid from lignin resembled soil humic acid in regard to the effect of various methods of treatment on its N content. In both cases the greater part of the N was not removed by the action of proteoclastic enzymes, pepsin and trypsin. The results are taken to support a hypothesis that soil humic acid contg. N consists of a complex composed of non-N humic acid and protein, and that the manner of assocn. is more intimate than that involved in the formation of a colloidal "salt" by the mutual pptn., in acid soln., of a negatively charged acidic colloid (humic acid) and positively charged protein on the basic side of its isoelec. point. **VIII. The nature of the organic nitrogen compounds of the soil: "non-humic" nitrogen.** *Ibid* 516–26.—From an examn. of the compds. remaining in soln. when humic matter is removed from alk. exts. of Rothamsted soils by acidification, it is concluded that 30–40% of the non-humic N is present in the form of peptides (proteoses, peptones and polypeptides), with 5% of free amino N and 12% of $NH_3$. The peptides are largely colloidal, and pptd. by basic Pb acetate and by phosphotungstic acid. The remaining 40–50% of the non-humic N is mainly pptd. by basic Pb acetate and is mainly non-basic. The non-humic N compds. are thought to be incorporated in the humic-clay gel so that for the most part they go into soln. only in solvents which dissolve the humic matter, and only in proportion to the amt. so dissolved. P. R. DAWSON

**The determination of exchangeable bases in carbonate soils.** RICE WILLIAMS *J. Agr. Sci.* **22**, 838–44(1932).—A method for detg. the total exchangeable bases of

carbonate soils is described. The carbonate in a known wt. of soil is decompd. by AcOH and the $CO_2$ evolved is estd. By further extn. with AcOH a soln. is obtained which contains not only the bases originally in combination with the $CO_2$, but also the exchangeable bases. The amt. of the latter is found by difference. P. R. DAWSON

**The contribution of clay and organic matter to the base-exchange capacity of soils.** RICE WILLIAMS. *J. Agr. Sci.* **22**, 845–51(1932); cf. preceding abstract.—Exptl. data are presented on the total exchangeable bases, clay, total C and C oxidizable by 4% $H_2O_2$ for a no. of carbonate soils. If it was assumed that soils contg. excess of carbonate under natural conditions were base-satd., the results were found to fit the equations: $B = 0.57K + 4.55C_t$, and $B = 0.57K + 6.3C_o$, in which $B$ represents the total exchangeable bases, $K$ the clay and $C_t$ and $C_o$ the total org. C and oxidizable C, resp. The values for exchangeable bases calcd. from the latter equation showed closer agreement with the experimentally detd. values than did those from the former, since certain soils contained appreciable proportions of elementary C (coal). When the org. matter of the soils was assumed to have a const. base-exchange capacity no correlation was found between the exchange capacity of their clay fractions and either their $SiO_2$-$Al_2O_3$ or their $SiO_2$-sesquioxide ratios. Carbonate soils whose exchangeable base content was appreciably less than the calcd. values either contained small amts. of $CaCO_3$ (<1%), or the bulk of it was present in coarse form. Soils which have been in contact with a sufficient excess of finely divided $CaCO_3$ for a long period of time may be regarded as satd., and it is suggested that the base-exchange content of such soils is the true measure of their base-exchange capacity. A comparison of the total exchangeable base content with the base-exchange capacity, calcd. from the clay and org. matter, is suggested as a measure of the degree of base satn. P. R. DAWSON

**Determination of sulfate in soil extracts.** J. S. HOSKING. *Chem. Eng. Mining Rev* **25**, 139–40(1933).—For the estn. of traces of sulfate in soil exts., the following conditions must be observed: (1) org. matter must be removed before pptn. of the Fe; (2) Fe must be removed; (3) concn of $NH_4Cl$ must be kept low; (4) the vol. of the soln. must not be less than 250 cc. and contain no more than 1% $N$ HCl; (5) $BaCl_2$ soln. must be added at once and in slight excess; (6) $BaSO_4$ ppt. must stand overnight on a warm plate; (7) dried ppt. and paper must be ignited separately. A method embodying these features is outlined. W. H. BOYNTON

**Changes in volume that occur when dry soils are wetted with water and with chemical solutions.** GEORGE BOUYOUCOS. *J. Am. Soc. Agron.* **25**, 129–33(1933).—A method is given for measuring changes in abs. vol. when dry soils are wetted with liquids. This consists of measuring in a dilatometer the combined vol. of a certain quantity of dried soil, free from air and covered with $CCl_4$, and the wetting soln. sepd. from the soil by the $CCl_4$ and then measuring the vol after the dilatometer has been tilted and the soil and wetting soln. have been intimately mixed. The abs vol. of the soils and liquids considered together decreases when the soils are brought into intimate contact with the liquids. This contraction varies with the different soils, being greatest in clays and in soils with high org. matter content. With the exception of KOH soln., the vol contraction in all the chem. solns. used ($N$ solns. of $MgCl_2$, KCl, $CaCl_2$, $BaCl_2$, LiCl, $SrCl_2$, NaCl, $NH_4NO_3$) was the same as that in $H_2O$, in any given soil. The contraction in the KOH was much less. The vol. contraction is probably due to the compression of the $H_2O$ absorbed by the soils. When soils are satd. with $H_2O$ or chem. solns. and swell and increase in vol., this increase is only apparent and not real. J. R. ADAMS

**A simple and rapid method for measuring the stickiness of soils.** GEO. BOUYOUCOS. *Soil Sci.* **34**, 393–401(1932).—The app. consists essentially of a metal disk 2 in. in diam. attached to a spring balance to which is fitted a sliding recorder that remains at the max. pull after the load is released. The results show that the max. pull per sq in. of metal required to release the disk varies from 0.0 lb. in muck and sand to about 10 lb for certain clays. There is a fairly close relationship between the max. stickiness and the clay content of most soils. In some cases, however, this relationship is very slight. There is some, though not a close, relationship between max. stickiness and the upper plastic limit. M. S. ANDERSON

**Hygroscopicity, adsorption bases and some physical properties of soils.** ISTVÁN KÜHN. *Kisérletügyi Közlemények* **35**, 61–71(1932).—Soil hygroscopicity is caused by the hydratation of ions absorbed by the soil. It is assumed that the ions covered with $H_2O$ mols. are adsorbed to the dry surface of the soil ultramicrons. S. S. DE FINÁLY

**Determination of unsaturation of soils by means of ammonia absorption.** JÁNOS DI GLÉRIA AND LÁSZLÓ KOTZMANN. *Mezögazdasági Kutatások* **5**, 270–8(1932).—Shake 10 g. soil with 100 cc. 0.1 $N$ $NH_4OH$, let stand for 3 days in a closed bottle, evap. to sirupy consistency, fill up twice with water and evap. again, wash into a Kjeldahl flask and distil the $NH_3$ with MgO. Det. the $NH_3$ content of the original untreated

soil in a blank expt. The difference gives the mg. equivalents of $NH_3$ bound by the soil. This method gives a more characteristic number than the conductometric titration or the Gedroiz or Hissink method. S. S. DE FINÁLY

**The laws of soil colloidal behavior. X. Exchange neutrality and combining capacity.** SANTE MATTSON AND JACKSON B. HESTER. *Soil Sci.* **34**, 459–83(1932); cf. *C. A.* **26**, 1692; **27**, 547.—The amphoteric nature of soils and their combining capacities are expressed in the form of neutralization curves obtained by treating electrodialyzed soil with a neutral salt soln. to which free acid is added on the one side and free base on the other. The type of curve obtained varied widely with the chem. compn. of the soil. The base taken up at a particular $p_H$ value might be used to characterize the chem. nature of a soil, both qualitatively and quantitatively. The character of the various horizons of a podsol profile may, for instance, be shown in this way. The $p_H$ developed in a neutral salt soln. represents very nearly the $p_H$ of exchange neutrality, that is, the point at which a soil combines with an equal no. of anions and cations of the salt This point is related to the strength of the acid and basic residues of the soil complex. Albumin combines with a considerable quantity of humic acid and thereby lowers the capacity of the acid to take up base. Humic acids are no stronger acids than some of the mineral complexes but combine with more base because of their relatively low equiv. wts. M. S. ANDERSON

**Cohesion forces in soils.** E. N. FOX. *Kolloid-Z.* **61**, 383(1932).—Polemical with Pokrovskii and Buluichev (cf. *C. A.* **26**, 5684). **Reply.** G. I. POKROVSKII. *Ibid* 383–4. A. FLEISCHER

**Physical factors affecting the determination of the number of nitrogen-fixing bacteria in soil.** H. W BATCHELOR. Ohio Agr. Expt. Sta., *Bull.* **516** (*51st Annual Rept.*), 34–5(1933).—Bacterial counts were made in equal wts. of soils passing 10-, 20- and 40-mesh sieves. The counts in the 40-mesh soil were 2–3 times greater than those from the coarser samples. Because the N-fixing bacteria occur in the soil in clumps, they must be shaken enough to break up all clumps but not enough to kill any cells Max. counts were obtained in soil suspensions when shaken in a shaking machine at 550 shakes a min. for 9 min. Methods of sampling are discussed. Bacterial colonies developing after 6 days are counted. C. R. FELLERS

**The value of soil inoculation in the present state of our knowledge.** M DÜGGELI. *Z. Pflanzenernähr., Düngung u. Bodenk.* **B12**, 38–43(1933).—A review C. J. S

**The Azotobacter test of soil fertility applied to the classical fields at Rothamsted.** JADWIGA ZIEMIECKA. *J. Agr. Sci.* **22**, 797–810(1932).—The kneaded plate method of detecting deficiency in CaO and available $P_2O_5$ was applied to 79 soil samples from the classical Rothamsted arable plots, and the *Azotobacter* population from some of these samples was estd. by counts on $SiO_2$ gel. The former tests correctly indicated whether $P_2O_5$ had been applied in soils receiving little or no N fertilizer; but in those receiving 86 lb. or more of mineral N per acre, little or no *Azotobacter* growth occurred, even in the presence of $P_2O_5$ and $CaCO_3$. That this failure was probably due to the scarcity of the organism originally present in the soil sample was indicated by the low counts obtained in such soils by the $SiO_2$ gel method. It is suggested that this is due to competition with other organisms where growth is stimulated by added N compds. When the kneaded plate method was modified (for samples of soils receiving 86 lb. or more of N per acre) by inoculating the sample with a culture of *Azotobacter* correct indications as to $P_2O_5$ content were obtained. In general, *Azotobacter*, when present, developed on kneaded plates if the soil contained at least 10 mg. of $H_2O$-sol. $P_2O_5$ per kg. of soil, but below this limit little growth occurred. The requirements of *Azotobacter* and of crop plants are similar as regards the need for sol. $P_2O_5$; but mineral N, although necessary to most crops, is detrimental to *Azotobacter* growth in field soil, while soil acidity is more harmful to it than to most crops. Hence there was no correlation between crop yield and *Azotobacter* activity. P. R. DAWSON

**Preliminary studies of the exuded plant sap and the relation between the composition of the sap and the soil solution.** W. H. PIERRE AND G. G. POHLMAN. *J. Am. Soc. Agron.* **25**, 144–60(1933).—A no. of different detns. were made on samples of the exuded sap of corn, sorghum and Sudan grass. The sap of corn contained about 3700 p. p. m. total solids, of which approx. $^1/_3$ was in the inorg. form. The total electrolytic content of the sap was less in nearly all cases studied than that of the displaced soil soln. The total P content of the sap from the 3 sources ranged from about 150 to 450 p. p. m. phosphate, of which at least $^2/_3$, and in some cases all, was generally in the inorg. form. $SiO_2$ in the plant sap amounted to about 250 p. p. m., Ca about 80, chlorides about 90, and nitrates varied from a trace to 344 p. p. m. P and $SiO_2$ occurred in much higher concns. in the plant sap than in the displaced soil soln., while with the chlorides and Ca the opposite was true. Nitrates were higher in some cases and lower in others in the plant sap than in the displaced soil soln. There may be a correlation between

the concn. of P in the plant sap and in the soil soln. and soil ext. The $p_H$ values of the plant saps varied from 4.40 to 4.80, and differences in soil acidity from $p_H$ 4.60 to 6.60 did not affect the acidity of the sap. The fact that the growth of sorghum and Sudan grass was relatively poorer than that of corn on acid soils could not be explained on the basis of the inability of the former plants to accumulate Ca or phosphate in their saps when grown in acid soils. The H-ion concn. of the soil did not affect the concn. of Ca, P and chloride in the plant sap within a range of $p_H$ 4.60–6.60. With increased $p_H$ values of the soil a slightly greater concn. of $SiO_2$ was found in the plant sap. Samples of sap from the same plants collected on successive days remained quite constant in total P for a period of 4 days. The inorg. phosphate increased as bleeding proceeded while the org. phosphate tended to decrease. Chlorides increased in the sap as bleeding continued, but Ca and $SiO_2$ did not show any consistent variations. The significance of these data in relation to the absorption and accumulation of inorg. elements in the plant sap is briefly discussed. Studies of the plant sap obtained by bleeding may be found useful in various studies of soil-plant relationships. J. R. Adams

**The microflora of the ash of the Katmai Volcano with especial reference to nitrogen-fixing bacteria.** Nathan R. Smith and Robert F. Griggs. *Soil Sci.* **34**, 365–73 (1932).—Samples of base volcanic ash collected 18 years after the eruption of Mt. Katmai contained no fungi or actinomycetes. The no. of bacteria was about 150,000 per g. and comprised none of the organisms commonly known to be able to fix N. M. S. Anderson

**Nitrogen fixers of leached alkali soils.** J. E. Greaves and J. Dudley Greaves. *Soil Sci.* **34**, 375–83(1932).—Eleven microörganisms were obtained from leached alkali soils and studied in pure cultures. The quantity of N fixed varied with the kind of organism and the carbohydrate added to the soil. The max. efficiency was about 1.4 mg. of N in 10 g. of soil. This compares favorably with fixations made by *Azotobacter*. M. S. Anderson

**The biological absorption of mineral nitrogen in the soil.** A. T. Kalachikov. *Chemisation Socialistic Agr.* **1**, No. 3–4, 35–44(1932).—Starch addn. caused a sharp decrease in nitrate in chernozem and a disappearance of nitrate in degraded chernozem. $NO_3$ was decreased 76% in the degraded chernozem and 40.8% in regular chernozem. The amt. of absorbed $NH_4$ increased from 15 to 51% 3 months after the addn. of the starch. No change in acidity took place. $Ca(NO_3)_2$ and $(NH_4)_2SO_4$ in conjunction with starch were absorbed biologically and converted into microbial cell N. J. S. J.

**The process of solonetz formation in the Golodnaya Steppe-Turkestan.** V. P. Kozlov *Chemisation Socialistic Agr.* **1**, No. 3–4, 61–2(1932).—Upon irrigation, solonetz was formed in regions where none was observed previously. Data are given on the compn. of an aq. ext., total humus, base-exchange capacity and adsorbed Na J. S. Joffe

**Contribution from chemistry to the close-grazing system of pasturage.** Frank T. Shutt and S. N Hamilton. *Trans. Roy Soc. Can.* **26**, Sect. III, 93–101(1932); cf. *C. A.* **24**, 4113.—The results recorded cover a 5-year period of rotational close grazing and heavy fertilization in the production of highly nutritious grass throughout the entire growing season. The field selected in the neighborhood of Ottawa, Ontario, had been cut for hay for a no. of years and had not been ploughed, pastured or fertilized for 30 years. The dominant grasses were meadow foxtail and timothy. Chem. analysis indicated clearly that herbage of 1–3 weeks' growth provided the max. amt. of a rich, highly digestible protein forage per unit of area. Cf. following abstr. J. W. S.

**High-protein pasture. The rotational or close-grazing system of pasture management.** Frank T. Shutt, S. N. Hamilton and H. H. Selwyn. *J. Agr. Sci.* **22**, 647–56(1932).—Five yrs.' expts. show that herbage of 1–3 weeks' growth is a rich protein forage; its dry matter has a range of 20–30% protein, much higher than that of grass cut for hay. The av. annual yield of protein per acre on rotational plots was approx. 185 lb. greater than that of the plot cut for hay. Lengthening the period of growth reduces the percentage of protein, but this reduction is not serious during the 1st 3 weeks. The inclusion of clover, as the scheme progresses, markedly raises the protein content of the herbage. All evidence shows that the yield of dry matter decreases with the frequency of cutting. The plot cut as hay with aftermath gave an annual yield of dry matter approx. 1600 lb. per acre higher than the plots cut every 2 or 3 weeks. The main advantage of the rotational scheme of pasture management is in protein production. Cf. preceding abstr. P. R. Dawson

**Yields and composition of pasture grass from the Tree Field plots at Cockle Park.** Brynmor Thomas and F. J. Elliott. *J. Agr. Sci.* **22**, 736–54(1932).—Studies of samples from areas cut at random, at intervals of 14 days during a season of 22 weeks, showed that the differences between the mean yields of dry matter from plots under varying fertilizer treatments were not significant. The protein content of grass from

control plots was markedly lower than that produced by treated plots, but varying fertilizer treatments were without effect. Fertilizers had little effect on the mean fiber content. Treatments of basic slag and $K_2O$ or basic slag and CaO yielded grass of higher CaO content than the control plot, while basic slag alone was without effect. Fertilizer treatment produced highly significant increases in the mean $P_2O_5$ content of the grass. The application of N in addn. to basic slag markedly increased the absorption of $P_2O_5$. The usual pos. correlation between protein and $P_2O_5$ was evident. P. R. DAWSON

**Some factors affecting the palatability of pasture plants.** A. B. BEAUMONT, R. E. STITT AND R. S. SNELL. *J. Am. Soc. Agron.* **25**, 123–8(1933).—Tests on a no. of pasture grasses showed that different fertilizer applications made practically no difference in palatability the 1st year after seeding, but the 2nd-year grass which had received N and minerals was grazed more than that which had received only minerals or no fertilizer. Grass which received high N appeared to be slightly more palatable than that which received medium or low amts. Toughness may be a deciding factor in palatability if other factors are favorable. J. R. ADAMS

**Five years' observations on the effect of fertilization upon yield and plant stand of a natural meadow.** H. RAUM. *Z. Pflanzenernähr., Düngung u. Bodenk.* **B11**, 537–52(1932).—Observations on 5 pairs of plots 10 m. square, of proved uniformity, indicated scarcely economical gains from 40% $K_2O$ salt, Rhenania phosphate, stall manure, $(NH_4)_2SO_4$ and $NaNO_3$. Hay from plots receiving N was not richer in protein N salts greatly reduced the stand of legumes, but stall manure did not. The proportion of weeds in the hay from plots receiving 40% $K_2O$ salt was slightly less. C. J. S.

**The composition of the spring growth of sweet clover as influenced by previous fall treatment.** C. J. BADGER AND H. J. SNIDER. *J. Am. Soc. Agron.* **25**, 105–8(1933).—Analysis of the sweet-clover tops and roots show that removal of the fall growth reduces the total dry matter, N, P and K in the following spring growth. The fall growth of sweet clover should not be removed on soils which are relatively low in N and org. matter. Cutting for fall hay also reduces the vitality or winter resistance of the sweet-clover plants. J. R. ADAMS

**The determination of effective strains of Rhizobium tripolii Dangeard, the root nodule bacteria of clover, under bacteriologically controlled conditions.** DOROTHEA L. KEENEY. *Soil Sci.* **34**, 417–43(1932).—The strains of bacteria efficient in N fixation maintained their high efficiency throughout sets of expts. Those of low efficiency also continued as such. One good strain increased the total N content of the clover crop 149.4% over the uninoculated controls. M. S. ANDERSON

**The adsorption of phosphoric acid by the soil.** A. T. KIRSANOV. *Chemisation Socialistic Agr.* **1**, No. 3–4, 27–34(1932).—On the basis of the adsorption capacity for $P_2O_5$ by a series of podzol and chernozem soils and the availability of the $P_2O_5$ to the plants these soils were divided into: (1) those which have an abundant available supply; (2) those which absorb a high amt. and make it unavailable; (3) those which absorb the added $P_2O_5$ but do not lower the availability. The soils of the second group can be detd. by extg. the soil with 0.05 *N* HCl. If a soil has a high humus content its absorptive capacity for $P_2O_5$ from acid soln. cannot serve as an indication of its belonging to the second group. J. S. JOFFE

**Relation between soil reaction and the content of root-soluble phosphoric acid and potash.** M. KLING AND O. ENGELS. *Z. Pflanzenernahr., Düngung u. Bodenk.* **B12**, 32–8(1933).—Tests on 166 soils by the Neubauer seedling method for available $P_2O_5$ and $K_2O$ indicated that either alk. or very acid soils are much more likely to be deficient in $P_2O_5$, and very acid soils in $K_2O$. C. J. SCHOLLENBERGER

**Phosphoric acid and potash content of Oldenburg soils in 1930.** CONTZEN. *Oldenburg landw. Blatt* **79**, No. 21(1931); *Phosphorsäure* **2**, 192.—The content of HCl-sol $P_2O_5$ and $K_2O$ was detd. in 340 sand soils and 236 marsh soils. Of the sand soils 74% were deficient in $P_2O_5$ and 92% in $K_2O$. The marsh soils contained higher percentages of $P_2O_5$ and $K_2O$, 58% being deficient in $P_2O_5$ and 15% in $K_2O$. K. D. JACOB

**Recent experiments and investigations for determining the soil fertilizer requirements in phosphoric acid and potash.** E. BECKER. *Z. Pflanzenernähr., Düngung u. Bodenk.* **B11**, 552–75(1932).—Comparison of response to $K_2O$ and $P_2O_5$ fertilization as indicated by data from field plots, lab. and vegetation tests of 40 Hungarian soils, indicated that in $^1/_3$ of the cases field results agreed with the indications for $P_2O_5$ need by the Lemmermann citric acid extn. method, in 50% with the Neubauer seedling test (I) and in 50% with the Sigmond $HNO_3$ extn. method (II). Agreement between field tests and I for $K_2O$ need was about 50%, for II about 30%. The lab. tests are described and discussed in detail. C. J. SCHOLLENBERGER

**Comparison of the Neubauer seedling-plant method and the Lemmermann citrate method with the results of field experiments at the Aschersleben experimental area.**

SCHÜLER. *Zuckerrübenbau* **12**, 136(1930); *Phosphorsäure* **2**, 127.—The Neubauer and Lemmermann methods for available $P_2O_5$ in soils gave results which were in good agreement, but the agreement between results by these methods and those of field expts. was not so good. K. D. JACOB

**The nature of phosphate fixation in soil.** M. C. FORD. *J. Am. Soc. Agron.* **25**, 134–44(1933).—Soils and certain pure minerals believed to be present in soils were treated with sol. phosphates to det. the degree and nature of the fixation. The soils fixed P in varying degrees in forms not easily sol. in $H_2SO_4$ of $p_H$ 3.0. Goethite fixed P in a form largely insol. in the $H_2SO_4$, the P fixed by bauxite was of intermediate soly., while hematite fixed no P. Heating destroyed the fixing power of goethite by changing it to hematite. The fixing power of bauxite was increased by partial dehydration, but further dehydration reduced this capacity. The phosphates formed with goethite and partially dehydrated bauxite were cryst. Prolonged heating of 6 soils at 185° markedly reduced fixation in relatively insol. forms and in some cases destroyed or practically destroyed it. This is probably due to the dehydration of goethite. The failure of prolonged heating at 260° to reduce fixation correspondingly in some soils is probably due to the increased activity of bauxite. The P fixed by soils as Ca or Mg phosphates is readily sol in weak solvents and thus quite available to plants; that which is fixed as $Fe^{+++}$ and Al phosphates by $Fe^{+++}$ and Al hydroxides, chlorides or sulfates is, at least in part, easily hydrolyzable and available to plants; while that which is fixed by goethite is very insol. and only slowly available to plants. Goethite present in different soils is believed to vary greatly in amt. and to persist in soils when once formed, because of insufficient heat in soils to dehydrate it. J. R. ADAMS

**Adsorption of phosphorus by soils.** GYÖRGY VÁRALLYAY. *Kisérletügyi Kozlemények* **35**, 72–5(1932).—Failure of P fertilizers to improve yield may be caused not only by a P richness of the soil but also by the fact that the soil adsorbs a significant part of the P fertilizer and its content of sol. P increases relatively very little. The P adsorption of soils should always be detd. in the examn of the effects of P fertilizers. S. S. DE FINÁLY

**The phosphorus concentration of the exuded sap of corn as a measure of the available phosphorus in the soil.** G. G. POHLMAN AND W. H. PIERRE. *J. Am. Soc. Agron* **25**, 160–71(1933). The detn. of the phosphate content of the exuded sap of corn plants is suggested as a method for measuring P deficiency in the soil. The amt. of inorg. phosphate found in corn sap varied from 62 to 602 p. p. m. and increased with the age of the plant. Results obtained under greenhouse conditions show a good correlation with the response of corn to phosphate fertilization and also with the $H_2O$-sol. phosphate and the available phosphate as detd. by the Truog method It would also appear that the method might be used to advantage in a study of the availability of various elements, particularly N and K. J. R. ADAMS

**Effect of exchangeable base and soil treatments on phosphorus solubility.** ALFRED T. PERKINS, H. H. KING AND E. J. BERNE. *Soil Sci.* **34**, 385–92(1932).—The absorbed bases in sep. portions of Cherokee loam were replaced with H, Fe, Al, Ca, Mg, K and $NH_4$ and the $H_2O$-sol. P was detd. in the various samples treated with $CaH_4(PO_4)_2$, $CaCO_3$, $CaCl_2$ and KCl in varying amts. P soln is increased by satn with K or $NH_4$. When P is added as $CaH_4(PO_4)_2$ to soils satd. with Fe or Al large amts of P are pptd. Much less P is pptd. by soils satd. by H, Mg or Ca and only very small amts. by soils satd. with K and $NH_4$. Applications of $CaCO_3$ increase the soly. of P in the soils satd. with Fe, Al or Mg but decrease it in those satd. with H, Ca, $NH_4$ and K. In the cases where there is an increase in P soly. it is thought to result from change in $p_H$ rather than from the Ca added since $CaCl_2$ does not increase the soly. of P. The soly. of P is not affected by the application of KCl regardless of the base held by the soil. M. S. ANDERSON

**Superphosphate, 1931.** A. N. GRAY. *Superphosphate* **6**, 21–9(1933).—Data are given on the world production, exports and imports of superphosphate. K. D. JACOB

**Reactions of superphosphate in the soil.** A. SANFOURCHE AND JEAN HENRY. *Compt. rend. acad. agr. France* **19**, 34–44(1933).—A comparison is made between the action of pure $CaH_4(PO_4)_2.H_2O$ on pure $CaCO_3$ and of superphosphate on $CaCO_3$. The reaction between the pure salts under normal conditions of temp. goes only to $CaHPO_4.2H_2O$. This reaction is complete only if the carbonate is finely ground and is in excess of the theoretical amt., and if the soln. of phosphate is not too dil. If these conditions are not fulfilled or if the $CaCO_3$ is covered by some insol. salts or dispersed in a large mass of soil, the reaction is partially checked and some of the $CaH_4(PO_4)_2.H_2O$ remains unchanged. At elevated temps., such as 50°, there is more or less reversion to $Ca_3(PO_4)_2$ depending on the length of time of the reaction. When $CaCO_3$ is mixed with a soln. of $CaH_4(PO_4)_2.H_2O$ from superphosphate this reaction

is almost completely stopped and the $CaH_4(PO_4)_2.H_2O$ retains its soly. This inhibition is due to a ferrophosphoric acid complex in the liquid phase of the superphosphate which forms a stable gel when the acidity of the liquid phase is neutralized and coats the $CaCO_3$ particles. Thus the assimilability of the $P_2O_5$ in superphosphate persists when this fertilizer is added to the soil and the properties of the superphosphate even oppose the formation of $CaHPO_4.2H_2O$. J. R. ADAMS

**Liming of soils in the recent agricultural literature.** S. I. TEIMIN. *Chemisation Socialistic Agr.* **1**, No. 3–4, 68–77(1932).—A review with 50 references. J. S. J.

**Summary of the results of the fertilizer tests [on sugar cane] in 1931.** E. DEMANDT. *Arch. Suikerind.* **40**, III, *Mededeel. Proefsta. Java-Suikerind.* 1–19(1932).—The results of 2530 fertilizer expts. on sugar cane in Java are given in tabular form and briefly discussed. The optimum dose of $(NH_4)_2SO_4$ was found to be lower than previously, and was independent of the time of harvesting. Contrary to expectations $NaNO_3$ did not do as well as $(NH_4)_2SO_4$ in fields affected with Kalimati disease. The optimum phosphate dose was also lower than before. $NH_4$ phosphates are at least as effective as equiv. quantities of $(NH_4)_2SO_4$ and superphosphate. Natural phosphate cannot take the place of superphosphate. Molasses proved generally better than manure. The effect of lime was negligible, and uneconomical even on acid soils. "*Microba*," a bacterial fertilizer, was found to be worthless. F. W. ZERBAN

**Quality and fertilization.** F. BUROW. *Kunstdünger u. Leim* **29**, 390–5(1932).—A review on the improvement in quality of grains, vegetables and fruits resulting from proper fertilization. C. J. SCHOLLENBERGER

**The failure of fertilizer experiments.** PILASKI. *Georgine* **108**, No. 27(1931), *Phosphorsäure* **2**, 380.—Phosphate fertilizers do not always increase the yield of potatoes, but they are of primary importance in increasing the starch content. K. D. J.

**Peat as fertilizer and soil-improving material.** BR. TACKE. *Z. Pflanzenernahr., Düngung u. Bodenk.* **12B**, 1–11(1933).—Application of low-moor peat to improve mineral soils is of no economic value. "Humus" prepd. from peat is not beneficial, although peat processed by addn. of molasses, $NH_4HCO_3$, etc., and fermented apparently has more value than the equiv. fertilizing elements added as salts. The best way to utilize peat as a fertilizer is to use it as an absorbent for liquid manure, as litter, etc. C. J. SCHOLLENBERGER

**The influence of moisture upon the rapidity of decomposition of low-moor peat.** SELMAN A. WAKSMAN AND E. R. PURVIS. *Soil Sci.* **34**, 323–36(1932).—The moisture content of peat has a marked influence upon the rate of its decompn. Under optimum moisture conditions about 15% of the dry weight of low-moor peat is decompd in 18 months. The volatile products liberated give the basis for this estn. The rate can be greatly varied by changes in water content. The peat used decompd. as a whole without any chem. complexes disappearing more rapidly than others. There is in general, however, some tendency toward a more rapid decompn. of the non-nitrogenous than the nitrogenous complexes. The av. ratio of C liberated as $CO_2$ to that of N liberated as $NH_3$ is about 20:1. The ratio in the peat itself is about 18:1. Decompn of peat increases the material sol. in dil. alkali. Drying and remoistening greatly stimulate the decompn. of peat. Proximate chem. analyses of peat after decompn for 560 days under different moisture conditions are given. M. S. ANDERSON

**Nitrophosphate Lonza. Results of fertilizer experiments carried out in Switzerland in 1929–1931 and the use of this new fertilizer in agricultural practice.** W. BANDI, W. MARBACH AND F. WERNER. *Schweiz. landw. Mh.* **10**, 177, 221(1932), *Fortschr. Landw.* **8**, 42.—This material is manufd. by the Lonza A.-G., Basel, by treating phosphate rock with $HNO_3$. It is marketed in a granular form, which is easy to distribute in the field, and contains 16–17% $P_2O_5$, 7–8% nitrate N and 25–30% $H_2O$-sol CaO, approx. 90% of the $P_2O_5$ being sol. in $H_2O$. The fertilizer is physiologically alk. in reaction. The fertilizer values of the $P_2O_5$ and N in this material are the same as those of the $P_2O_5$ and N in superphosphate and $Ca(NO_3)_2$, resp. K. D. JACOB

**Making phosphate fertilizers at Trail.** WM. C. WEBBER *Chem. & Met. Eng.* **40**, 72–5(1933). E. H

**Factors affecting the use of nitrate and ammonium nitrogen by apple trees.** VICTOR A. TIEDJENS AND MAURICE A. BLAKE. N. J. Agr. Expt. Sta., *Bull.* **547**, 3–32(1932), cf. *C. A.* **26**, 4671–2.—Apple trees absorbed and assimilated ammonium N without oxidation to nitrate. The $p_H$ of the culture medium was a limiting factor in the assimilation of both $NH_4$ and nitrate. In soils of comparatively low $p_H$, $NH_4$ was apparently oxidized to nitrate before assimilation of N occurred. Nitrate, however, was assimilated most efficiently under these conditions. $NH_4$ was assimilated without change at high $p_H$ values of the soil, and under those conditions produced more rapid growth of plants than nitrate. Rapid assimilation of $NH_4$ resulted in a comparatively low concn. of sugars and starch. Cellulose and hemicellulose were generally high when

trees were supplied with $NH_4$ at a favorable $p_H$ but the data are inconclusive. To obtain equal increase in org. N and growth, it was necessary to supply the trees with much higher concns. of nitrate than of $NH_4$. Reductase activity (nitrate reduction) as measured by the Eckerson test (*C. A.* **26**, 172) was very weak in the rapidly growing $NH_4$-supplied trees. The assimilation of both $NH_4$ and nitrate took place chiefly in the fine fibrous roots of the apple. The rapid increase in amino acids in the trees supplied with $NH_4$ was not accompanied by the most rapid growth. The $NH_4$ trees made their greatest growth when the nutrient soln. was supplied at an initial $p_H$ of 7.5–8.5, where the $p_H$ did not remain const., or at $p_H$ 6–6.5 when a const. $p_H$ was maintained. The greatest increase in amino acids occurred at $p_H$ 5.5–6.5. The basic and humin fractions had their greatest accumulation when the nutrient soln. was supplied at an initial $p_H$ of 7.5. The greatest vol. of growth occurred where the ratio of protein to sol. N was comparatively high. Forty references are appended. C. R. F.

**Preliminary studies in the use of nitrate of soda on certain Indiana soils.** Frank Moser. *Soil Sci.* **34**, 445–57(1932).—The influence of $NaNO_3$ was studied on corn, wheat and timothy yields on plots in various locations in Indiana. The yields varied considerably with season of application, amt. of $NaNO_3$ added, and method of placement. The protein contents of corn and wheat were increased appreciably by increasing the $NaNO_3$ application and by making the application late in the growing season.
M. S. Anderson

**Effect of fertilizers upon the grain texture and protein content of wheat.** E. G. Bayfield. Ohio Agr. Expt Sta., *Bull.* **516** (*51st Annual Rept.*), 29–30(1933).—Texture of wheat is estd. from the relative nos. of starchy and vitreous kernels. Counts were made to det. the percentage of the different textural types of kernels present: (1) soft and starchy, opaque type; (2) hard and vitreous, translucent type; (3) intermediate types. The percentage of soft starchy kernels is directly related to low-protein content P fertilizers lower the protein content and increase the percentage of soft kernels. N fertilization increases the protein content and the no. of hard vitreous grains. K fertilizers have little influence on quality but give results more like N than P.
C. R. Fellers

**Experiment with olive-husk fertilizers.** J. Bonnet. *Rev. vit.* **77**, 69–71(1932).—Fresh husks alone and mixed with basic slag and sylvinite gave bad results but old, dry husks in similar mixts. proved excellent as a fertilizer. When husk prices are low a compost of husks, basic slag and sylvinite for use on olive trees should be prepd. and allowed to stand for several months. Husks contain 1% N, 0.8–0.9% potash and 0.1–0.2% $P_2O_5$. F. W. Marsh

**The effect of fertilizers and climate on the yield and soundness of potatoes.** O. Engels. *Kartoffelbau* **14**, 2(1930); *Phosphorsäure* **2**, 381. K. D. Jacob

**Fertilization and potato diseases.** Gelbke. *Deut. landw. Presse* **1**, 7(1932); *Phosphorsäure* **2**, 254.—High yields of disease-free potatoes were obtained when basic slag was used in connection with $(NH_4)_2SO_4$ and potash salts. K. D. Jacob

**Fertilizing action of magnesia.** Ch. Brioux and Edg. Jouis. *Ann. agron* [N. S.], **2**, 146–69(1932).—Pot expts. indicated that fertile soils may show greater yields through the addn. of easily sol. magnesia, Mg oxide or sulfate. Field expts. did not substantiate this. Mg contents of plants in pots with added Mg were greatly increased. Lime and Mg are somewhat interchangeable in plant nutrition. F. W. Marsh

**The physiological acidity of potash salts.** D. N. Pryanishnikov. *Chemisation Socialistic Agr.* **1**, No. 5, 28–40(1932); cf. *C. A.* **26**, 5125.—From a series of expts. with various plants with respect to the different absorptions of K and the anions of the K salts it has been established that the grain crops, except corn, behave differently from the legumes (peas and beans) and sugar beet. More Cl is absorbed by the grain crops, thus giving less physiol. acidity than the other crops which absorb more K and less Cl.
J. S. Joffe

**The Aspergillus method for the determination of the potassium requirement of soils.** H. Niklas and H. Poschenrieder. *Mezögazdasági Kutatások* **5**, 341–50(1932); cf. *C. A.* **27**, 550.—Detailed description. S. S. de Finály

**Comparison between some methods of determining the potash fertilizing requirements of arable soils.** Folke Nydahl. *Kgl. Landtbruks.-Akad. Handl. Tid.* **71**, 845–68(1932).—Various extn. methods of detg. the K fertilizing requirements of arable soils were studied with special attention to obtaining as simple and reliable an exptl. procedure as possible. The following extn. media were used: *N* and 0.04 *N* $NH_4Cl$ soln., a soln. *N* in AcOH and 0.5 *N* in $NH_3$, 0.1 *N* $CaCl_2$ soln., $Ca(HCO_3)_2$ soln. and $H_2O$; the "root-sol." K was detd. according to Neubauer-Schneider. All extn. methods gave corresponding values when the amt. of colloidal material in the soil was considered. The $CaCl_2$ method, being the simplest and cheapest one, was compared with pot expts., according to Mitscherlich, and field expts. The sp. gr. of the soils

and the depth of the vegetable mold were introduced as corrections for the $CaCl_2$ values. Different soil types (mainly the clay content) and the $p_H$ value both influenced the results. Because of the comparatively small no. of soils examd. no correlation coeffs. were calcd., but, when the best limit values were introduced, the method gave the same information for 70–85% of the soils investigated as the field expts. The $H_2O$ and the $Ca(HCO_3)_2$ extn. methods of Dirks were compared with fields expts. Agreement was obtained in 73% of the cases. A summary in English is given. Cf. Cameron and Failyer, *J. Am. Chem. Soc.* **25**, 1063(1903); *C. A.* **18**, 877; **22**, 4140; **24**, 2822; **26**, 3059. D. Thuesen

**The action on the growth of crops of small percentages of certain metallic compounds when applied with ordinary artificial fertilizers.** Winifred E. Brenchley. *J. Agr. Sci.* **22**, 704–35(1932).—No beneficial effect on the growth of barley or mustard on 2 types of soil was obtained by the addn. of quantities of $CuSO_4$ ranging up to 4% of the total artificial fertilizers applied. (One of the soils was light, very acid, deficient in $P_2O_5$ and Ca, but well supplied with sulfate; the other was a heavy loam contg. a sufficiency of Ca. The former was limed to compensate for the acidity.) Expts. on English acid and alk. peats with barley, rye and turnips failed to show the striking results obtained on the saw-grass peat of the Florida Everglades. The reduction of crop resulting in some cases from increased fineness of grinding of basic slag may be due to the presence of V. Expts. show that this element is definitely toxic to plant growth Li compds. are much less toxic than Cu to the growth of barley. In some water-culture expts. a suggestion of stimulation was obtained with very dil. concns. of LiCl in the presence of nutrient salts. Buckwheat is much more sensitive to the toxic action of Li and shows no stimulation with any concn. Small proportions of Ti compds., added to the usual artificial fertilizers, failed to improve the growth of mustard on the same 2 soils as were tested with $CuSO_4$. The amt. of CaO present in the Ti compds. was insufficient to benefit the soil for which liming was requisite in the ordinary course of cultivation. Barley was very sensitive to the toxic action of $Al_2(SO_4)_3$; peas were much less affected. The toxic action did not appear to be assocd. with increased acidity, as corn grew well in a control soln. as acid as those which killed the plant in the presence of strong $Al_2(SO_4)_3$. No evidence of stimulation was obtained with barley, peas or corn with any strength of $Al_2(SO_4)_3$, however dil. A bibliography of 52 references is appended. P. R. Dawson

**The "technical values" in agriculture; their control by foliar diagnosis.** Henri Lagatu. *Bull. soc. encour. ind. nat.* **131**, 669–85(1932).—The suggestion is made that the annual foliar diagnosis constitutes a true, sensitive, practical and kinematic method of investigating the reaction of any factor on the growth and yield of plants Its application to potato and grape cultivation is demonstrated. Field tests check the findings of annual foliar diagnosis in that fertilizers contg. N are very effective in increasing the yield of potato plants grown in calcareous or siliceous soils and also that, in aging, the leaves of the plants grown in calcareous soil become progressively alk through absorption of CaO, while in the non-calcareous soil the alky. is produced by $K_2O$ absorption. Similar studies applied to grape cultivation show that $K_2O$ is necessary for a good yield. J. R. Adams

**Stimulation of grain seeds.** V. Casaburi. *Industria chimica* **7**, 1630–3(1932) The product, *Uni-Dea*, which is an org. compd. of the methylenedinaphtholsulfonic acids combined with Hg, Cu and Fe, has been found to have a triple action on grain seeds It is a *disinfectant, fungicide* and *stimulant to the development and growth of the grains*. Not only is the yield per hectoliter increased up to 32%, but the gluten content of the resulting flour also averages about 1% higher. A. W. Contieri

**Wood diagnosis of the vine and its possible extension to fruit and forest trees.** Laurent Rigotard. *Rev. vit.* **77**, 237–9(1932); cf. Vinet, *C. A.* **26**, 5004.—R. urges the analysis of the woody portion of trees and of the sap of the vegetative reawakening season as an aid to modifying methods of treatment and in estg. the proper time of fertilizer application. F. W. Marsh

**Wood diagnosis of perennials [vine] and its relation to leaf diagnosis.** E. Vinet. *Rev. vit.* **77**, 219–22(1932); cf. Vinet and Lemesle, *C. A.* **24**, 5916; **26**, 2214; **27**, 1442. The different parts of 2 grapevines, one grown with, and one without, fertilizer, were analyzed. N and $P_2O_5$ were at a max. in the newest growth and the roots. K was at a min. in the roots and at a max. in the sprouts and buds. All plant parts showed the favorable results of fertilization. The base of ripened twigs should be used for wood diagnosis. A comparison of wood and leaf diagnosis established that both facilitate the control of vine nourishment. Leaf diagnosis shows the variations during plant growth while wood diagnosis dets. the "resultant." F. W. Marsh

**Fertilizer experiments on perennial clovers.** Ödön Villax. *Kisérletügyi Kozle-*

*mények* **35**, 45–59(1932).—In *Medicago*, *Trifolium* and *Onobrychis* root development is the strongest in sandy soils poor in nutriments. *Onobrychis* has the largest N-accumulating capacity. P fertilizers increase the development of roots and nodules in the year of the treatment on peat and sand, and also increase the above-ground portion of the plant. *Medicago* is most sensitive to P fertilization; *Trifolium*, to K fertilization. The combined use of K and P gives the best results. Treatment with N fertilizers significantly decreases the development of roots and nodules. S. S. DE FINÁLY

**Mineral nutrients of plants.** ETTORE BOTTINI. *Industria chimica* **7**, 1634–7 (1932).—The mineral contents of a no. of common vegetables and grains are given, and the amts. of these elements which are removed from the soil by a crop. The need of replacing these elements for a rational fertilizing program is emphasized. A. W. C.

**Aspects of plant nutrition.** B. VISWANATH. *Soc. Biol. Chemists, India* **1932**, 39 pp.; cf. *C. A.* **26**, 1372.—A general survey of progress of research in plant nutrition from the standpoint of soil, plant and animal relationships. A bibliography of 160 citations is given. H. R. KRAYBILL

**Physiology of nutrition of the sugar cane. I.** T. H. VAN DEN HONERT. *Arch. Suikerind.* **40**, III, *Mededeel. Proefsta. Java-Suikerind.* 1539–608(1932).—After a review of the literature, the methods used for growing cane in sand, water and sand-water cultures are described. It was found that for normal growth the nitrate concn. must be much larger than the $K_2O$ concn., and the latter much higher than the $P_2O_5$ concn. The proportion is about 21:3.8:0.9. Lack of N causes light-colored, yellowish leaves; it produces higher rendement; when pronounced, it reduces stooling and gives rise to thin stalks with long internodes. Lack of P does not affect the color of the leaves or even darken it; stooling is reduced more than by lack of N; the stalks have short internodes; small sprouts with short, broad leaves are produced and these remain alive for a long time. Lack of K produces red or reddish brown spots on the upper side of the middle nerve, often in a double row on opposite sides of a dirty yellowish white streak of dead epidermis; microscopic examn. shows that the cell walls of the epidermis have become gummy and discolored; the tips and edges of the leaves dry and curl up, and a yellow band appears along the part which is still green; the wt. of the stalk and the rendement are reduced; small sprouts with long, thin leaves appear, and they die out shortly. F. W. ZERBAN

**Effect of plant-nutrient substances on the sugar content of sugar beets.** E. ROSENBLÜH. *Zuckerrübenbau* **14**, 86(1932); *Fortschr. Landw.* **7**, 589.—When applied to soils contg. 20 mg $K_2O$ per 100 g., as detd. by König's method, potash fertilizers caused a considerable increase in the yield and sugar content of beets. With soils contg. 53 mg $K_2O$ potash fertilizers had no effect. Studies were made of the effect of potash on the metabolism of sugar beets grown in soils of varying degrees of acidity and contg. different amts. of available $P_2O_5$ and $K_2O$. K. D. JACOB

**Summary of the results of the plot tests on various [sugar-cane] problems in 1931.** E. DEMANDT. *Arch. Suikerind.* **40**, III, *Mededeel. Proefsta. Java-Suikerind.* 21–32 (1932).—A brief résumé of the effect of various agricultural practices on cane and sugar yields, as disclosed by field expts. on soil prepn., planting, cultivation and harvesting. F. W. ZERBAN

**Review of the results of field experiments on sugar-cane culture in Java. Fertilization with molasses.** G. BOOBERG. *Arch. Suikerind.* **40**, III, *Mededeel. Proefsta. Java-Suikerind.* 103–318(1932).—An exhaustive treatise, based on all the work done in Java since 1889, with a complete bibliography, numerous tables and diagrams. Molasses is more valuable as a fertilizer than as a fuel, and more valuable than other auxiliary fertilizer materials. It gives better results in dry areas than in those abundantly supplied with moisture. Molasses increases the yield of cane, but slightly depresses the rendement. The best results are generally obtained on the poorer, especially light sandy soils, while heavy soils respond less. There are even some soils, mostly of the heavier type, where molasses caused decreased yields. Three methods for applying the molasses in the field are recommended: (1) application with the irrigation water either before or after the rice crop preceding the cane crop, at least 3 weeks before planting either crop; (2) in undild. form in the furrow, at least 3 weeks before planting; (3) to growing cane, either undild. on the ridges, or greatly dild. with irrigation water, in the furrow. Undild. molasses should not be applied in the furrow after planting. F. W. ZERBAN

**[Report of the] entomology department.** A. W. LOPEZ. Philippine Sugar Assoc., *Ann. Repts.* **1931**, 227–73(1932).—In lab. expts. *K thiocarbonate* was highly toxic to grubs of *Leucopholis irrorata*, but did not give satisfactory results when used in the field. Application of filter-press mud at the rate of 40 tons per hectare caused a 20% reduction in the grubs infesting field soils. K. D. JACOB

**Report of the scientific committee—insecticides.** C. H. PEET. *Soap* (*Insecticide*

*and Disinfectant Sect.*) **9**, No. 1, 87–8(1933).—A review of the past year's literature on synthetic insecticides, rotenone, pyrethrum, fluorides and arsenicals. H. H. R.

**Report of insecticide standardization committee.** N. J. GOTHARD. *Soap* (*Insecticide and Disinfectant Sect.*) **9**, No. 1, 86–7(1933).—Considerable variation was found in the atomizers used in the Peet-Grady method (*C. A.* **22**, 4734) for standardizing liquid household insecticides, resulting in great differences in the tests. It is recommended that a standardized atomizer be used. HENRY H. RICHARDSON

**Safety in insecticide use.** EDWARD BOCHER. *Soap* (*Insecticide and Disinfectant Sect.*) **9**, No. 2, 95(1933).—A discussion of household insecticides. Care should be used with some of the newer contact liquid sprays such as halogenated hydrocarbons which though not sufficiently toxic to cause immediate death may cause edema of the lungs. HENRY H. RICHARDSON

**Grape leafhopper in California, with special reference to its control.** STEWART LOCKWOOD. Calif. Dept. Agr., *Monthly Bull.* **21**, 375–93(1932).—The grape leafhopper, *Erythroneura comes*, is best controlled by clearing away surrounding vegetation and dusting the vineyard with $Ca(CN)_2$ at the rate of 20 lb. per acre. When the majority of the adults have collected in the vineyard and before many eggs have been deposited, the use of a pyrethrum-petroleum oil vaporized spray applied at the rate of 2 gal. per acre is advocated. After the spring hatch has occurred a combination spray consisting of 1 lb. of 40% nicotine sulfate and 4–4–50 Bordeaux mixt. with water to make 100 gal. is recommended. C. R. FELLERS

**Red oxide of copper as a dust fungicide for combating damping-off by seed treatment.** JAMES G. HORSFALL. N. Y. Agr. Expt. Sta., *Bull.* **615**, 3–26(1932); cf. *C. A.* **25**, 4967.—Cuprite, $Cu_2O$, is proposed specifically as a seed-treatment fungicide and its possibilities as a substitute for Cu-lime dust are suggested. The $Cu_2O$ was especially effective on smooth seeded plants such as tomatoes, eggplants, peppers, spinach and cabbage. It adhered especially well to the seeds. $Cu_2O$ may be dild. to $^1/_4$ without altering its fungicidal properties. CuO exerted but little fungicidal effect in seed treatment although it adhered well to the seeds. There was very little seed injury from the use of $Cu_2O$; in fact, emergence of the seedlings was accelerated in some cases. $Cu_2O$ may possess fungicidal properties as a foliage dust or spray. This point is being studied. C. R. FELLERS

**The fungicidal properties of certain spray fluids. IX. The fungicidal properties of the products of hydrolysis of sulfur.** H. MARTIN AND E. S. SALMON. *J. Agr Sci.* **22**, 595–616(1932); cf. *C. A.* **26**, 3607.—The results of tests made on the conidial stage of the hop powdery mildew (*Sphaerotheca humuli*) indicate that the fungicidal activity of S in the form of sulfite, hyposulfite, sulfoxalate, thiosulfate or monosulfide is insufficient to account for the fungicidal properties of finely divided elementary S. The fungicidal properties of solns. of $Na_2S$, NaOH and $Na_2CO_3$ are due to their alky. and $H_2S$ liberated from the solns of $Na_2S$ used is without action on the organism tested. The active fungicide produced by the hydrolysis of S is S in polysulfide form. The action of Agral I in promoting the fungicidal action of elementary S may be due to the enhancement of the action of $S_x$ in the presence of this spreader. The direct fungicidal action of $S_x$ solns. is due to the $S_x$ as such. P. R. D

**Wetting, spreading and emulsifying agents for use with spray fluids. IV. Miscible oils.** R. M. WOODMAN. *J. Soc. Chem. Ind.* **52**, 4–6T(1933); cf. *C. A.* **27**, 1442. The use of toxic oils in spray emulsions and the standards which they should fulfill are described. Neither tetralin nor dekalin could adequately take the place of phenol in aq. spray solns. Am alc. (fusel oil) may be used instead of phenol as an aid to soln in the prepn. of a miscible oil. The miscible oil-forming tendency of various mixts of fusel oil and soap has been measured and the character of the emulsions from these miscible oils studied. The effect of incorporation of resin oil and of water has also been investigated. J. R. ADAMS

**The role of wetting agents in the fixation, by plant tissues, of coloring materials used for the treatment of cryptogamic diseases.** AUGUSTIN BOUTARIC, MAURICE DOLADILHE AND MAURICE PIETTRE. *Rev. vit.* **77**, 85–6(1932); cf. Truffaut and Pastac, *C. A.* **24**, 2228–9, 5924.—Coloring materials with electropos. particles are necessary for good results. Most wetting agents which reduce surface tension are alk. org. salts. Beyond a certain point they make the particles of the coloring material neg. and these are then not fixed on the cellulose. The fixation of acridine orange on cellulose was very slightly reduced by Am alc. and camphor while surface tension was greatly lowered. Brécolane, while lowering surface tension to about the same extent, greatly reduced fixation. F. W. MARSH

**The utilization of organic coloring materials and 8-hydroxyquinoline in combating cryptogamic diseases of the vine.** ANDRÉ MEYER. *Rev. vit.* **77**, 117–20(1932); cf. *C. A.* **27**, 365.—Eight dyes, 3 wetting agents and 8-hydroxyquinoline were tested in

vineyards. The sulfate of *o*-hydroxyquinoline in 1/6 concn. showed the greatest efficiency against mildew. The surface tensions of the dyes and the hydroxyquinoline plus wetting agents and with an adhesive were measured. A criticism of an article by Boutaric, Doladilhe and Piettre (preceding abstr.) is appended. F. W. MARSH

**Treatments against mildew in 1932.** A. CADORET. *Compt. rend. acad. agr. France* **18**, 1146–9(1932).—Well executed sulfating with mixts. rich in Cu and lime is effective against mildew in vineyards. J. R. ADAMS

**Cercospora control in Monzon.** T. COSTA. *Ind. saccar. ital.* **25**, 535–8(1932).—Infected beets treated with Bordeaux mixt. lose less foliage and gain 2.5% in sucrose. The sucrose of untreated beets is not influenced by the greater loss in foliage. L. C.

**The use of derris against the sheep tick.** J. MACLEOD. *Scottish J. Agr.* **16**, 84–6(1933).—When used under comparable conditions, a derris-soap soln. contg. 0.21% toxic ext. was more effective against the sheep tick, *Ixodes ricinus*, than 0.2% $As_2O_3$ or 0.35% PhOH solns. A 4-day-old derris dip was not so efficacious as fresh dip, but was practically as destructive to ticks as fresh solns. of $As_2O_3$ or PhOH. K. D. JACOB

**Anthracene oil in the orchard.** R. BICHET. *Prog. agr. vit.* **98**, 205–14(1932).—The prepn. and use of an anthracene oil emulsion in Bordeaux mixt. are described. The foliage of trees treated in the winter was darker green than untreated trees. Excellent results were obtained against mosses, lichens, fungi, plant lice, etc. It is debatable whether or not the anthracene oil diminishes the anticryptogamic effect of the Cu. F. W. MARSH

**Extra potash controls rust and wilt [of cotton].** HENRY T. MADDUX. *Com. Fertilizer* **46**, No. 1, 14–17(1933).—In 587 top-dressing expts. carried out over a period of 5 years, application of 50–100 lb. KCl in addn. to the regular application of complete fertilizer gave an av. increase of 147 lb. seed cotton per acre per year, incidence of rust being greatly reduced by the extra potash. In sandy alluvial soils fertilizers contg. potash are very effective in reducing cotton-wilt infection and increasing yields. K. D. JACOB

**The use of chemicals for killing bananas in the treatment of Panama disease.** F. E. V. SMITH. *J. Jamaica Agr. Soc.* **36**, 184–7(1932).—The root system of banana plants affected with Panama disease was effectively killed by the application to the root and the soil immediately surrounding the plant (from which dry trash and other debris had been removed) of kerosene, light gas oils, Delco oil or heavy gas oil. The best results were usually obtained with heavy gas oil (sp. gr. up to 0.8869, av. flash point 181° F.) produced by the "topping" process, 1.5 pints per plant usually being sufficient. To a limited extent, the treatment inhibits the growth of *Fusarium cubense* and reduces the amt. of spore formation. The oil had no harmful effect on banana and other plants grown on the soil 2–6 months after treatment. K. D. JACOB

**Combating the fire-spot disease of tobacco [Colletotrichum tabacum] by cauterizing the seed and by prophylactic treatment of the plants with chemical agents.** K. BONING. *Prakt. Bl. Pflanzenbau* **10**, 89(1932); *Fortschr. Landw.* **7**, 588.—Control of the fire-spot disease of tobacco was obtained by dipping the seed for 30 min. in 0.25% solns. of uspulun, uspulun universal, germisan or $AgNO_3$, or in 0.05% soln. of $HgCl_2$. Injury to germination was prevented by soaking the seed for 12 hrs. in water before planting. Control of the disease was also obtained by treating the plants in the seed bed with 1% Cu-lime soln. or with the proprietary dusts cusisa and cupulvit. In the field, the disease was controlled by means of Cu-contg. sprays and dusts. K. D. J.

**The treatment of wheat rot. III. Action of copper products and formal compared.** G. ARNAUD AND M. GAUDINEAU. *Ann. agron.* [N. S.], **2**, 229–46(1932); cf. *C. A.* **25**, 4349.—Under av. winter conditions about Paris there was little difference in efficiency between soaking and dusting. Among the best substances for soaking were formol and Bordeaux mixt. with casein (preceded by washing) and for dusting CuCl and Cu oxychloride. F. W. MARSH

**Treatments for seed potatoes.** W. E. BRENTZEL. N. Dak. Agr. Expt. Sta., *Circ.* **102**, 4 pp.(1931). --The HCl-$HgCl_2$ dip is recommended as giving the best control of scab, rhizoctonia and blackleg diseases. Cf. *C. A.* **25**, 1025. C. R. FELLERS

**Control of quack-grass, Agropyron repens.** WALTER S. BALL AND WILFRED W. ROBBINS. Calif. Dept. Agr., *Monthly Bull.* **21**, 414–15(1932).—$NaClO_3$ mixed at the rate of 1 lb. per gal. and used as a spray 2–3 times a year gave very good control of this troublesome weed. Cf. *C. A.* **25**, 1025. C. R. FELLERS

**Decomposition and movement of herbicides in soils and effects on soil microbiological activity and subsequent crop growth.** W. E. BOWSER AND J. D. NEWTON. *Can. J. Research* **8**, 73–100(1933).—Expts. were conducted to det. the residual effect of $H_2SO_4$, $CuSO_4$, $NaClO_3$, $BaClO_3$ and $Na_2Cr_2O_7$ on 3 typical Alberta soils. No problem of residual effect was found with the 2 leaf sprays, $H_2SO_4$ and $CuSO_4$. $NaClO_3$ remains

toxic for about 2 years, depending mainly on the org. matter content of the soil and the amt. of leaching that takes place. The distance that the chlorate leaches down into the subsoil depends on the amt. of rainfall and the character of the soil. As soon as the chlorate is leached out or is reduced the soil returns to its normal productive power. $Na_2Cr_2O_7$ decomps. very rapidly in the soil. It has a depressing effect on nitrification and on the activity of the soil microörganisms. However, there is practically no residual effect from the use of $Na_2Cr_2O_7$ on soils of medium to high org. matter content.
J. W. SHIPLEY

**Control of weeds in cereal crops on moss peat soils.** F. BRÜNE AND C. HUSEMANN. *Mitt. Vereins Forderg. Moorkultur Deut. Reiche* **50**, 32(1932); *Scottish J. Agr.* **16**, 116.—Control of redshank (*Polygonum persicaria*), groundsel (*Senecio vulgaris*), hemp nettle (*Galeopsis tetrahit*), chickweed (*Stellaria media*), spurry (*Spergula arvensis*) and cornflower (*Centaurea cyanus*) in cereals grown on moss peat soils was obtained by the application of $1^1/_2$–$6^1/_2$ cwt. of Hederich kainite per acre 4–5 weeks after sowing in the case of summer crops, and about the middle of Nov. with winter crops. K. D. J.

**Sodium chlorate-limestone mixtures as weed killers for dry application.** C. J WILLARD. Ohio Agr. Expt. Sta., *Bull.* **516** (*51st Annual Rept.*), 23–4(1933); cf. *C. A.* **26**, 3865.—$NaClO_3$ when finely ground and mixed with limestone has no tendency to cake, and in preliminary trials gave very satisfactory results in weed control.
C. R. FELLERS

**Results of tests of alum treatment.** A. TOUZE. *Prog. agr. vit.* **98**, 368–9(1932).—Mildew development was not arrested by treatment with alum on August 31st.
F. W. MARSH

**Fertilizer.** ROBERT GRIESSBACH and HANS WEISS (to Ohio Sanitary Engineering Corp.). U. S. 1,889,654, Nov. 29. See Ger. 531,705 (*C. A.* **26**, 248).

**Fertilizer.** JOHN T. TRAVERS and OLIVER M. URBAIN (to Ohio Sanitary Engineering Corp.). U. S. 1,889,712, Nov. 29. A fertilizer is prepd. contg. the compd. $SiO_2.P_2O_5$ together with a N-contg. inorg. fertilizer material, etc.

**Fertilizers.** ÉDOUARD URBAIN. Fr. 40,531, Dec. 2, 1930. Addn. to 714,227 (*C. A.* **26**, 1702). Mixts. of dry products capable of forming an $NH_4MgPO_4$ by hydration are used as fertilizers. Thus, the theoretical amt. of $(NH_4)_2SO_4$ and MgO which will form $CaSO_4$ and $NH_4$ Mg phosphate is added to superphosphate.

**Fertilizer.** I. G. FARBENIND. A.-G. Fr. 40,720, Sept. 9, 1931. Addn. to 654,017 (*C. A.* **23**, 3770). A mixed fertilizer is prepd. by the reaction of KCl with $NH_4NO_3$ in a lye contg. alkali, alk. earth or $NH_4$ phosphates. Cf. *C. A.* **27**, 1081–2.

**Fertilizers.** I. G. FARBENIND. A.-G. Fr. 737,344, May 20, 1932. Mixts., preferably eutectic, of $Mg(NO_3)_2$ with other salts such as $Ca(NO_3)_2$, $NaNO_3$ or $KNO_3$ are used to coat the grains of an $NH_4$ nitrate-sulfate fertilizer to render it stable to storage Cf. *C. A.* **27**, 1081–2.

**Fertilizers.** JOSEPH ROSSMANN. Fr. 737,476, May 24, 1932. A sol. fertilizer is prepd. by heating $NH_2COONH_4$ with $Ca_3(PO_4)_2$ in an autoclave. The $NH_2COONH_4$ is prepd. by the action of $CO_2$ on liquid $NH_3$.

**Fertilizers.** BAMAG MEGUIN A.-G. Fr. 737,502, May 24, 1932. $Ca(NO_3)_2$ is made easy to spread by forming on the grains protecting layers, by the action first of $NH_3$ and then of $CO_2$ or $SO_2$, preferably at above 100° and under pressure.

**Fertilizers.** RAOUL A. E. PETIT. Fr. 737,557, Sept. 16, 1931. CaO is usable as a fertilizer without harmful action by mixing it with another fertilizing substance such as sylvinite or potash.

**Fertilizer from fecal matter in sewage.** RICHARD FLUCK and ALFRED THEIL (to Wilhelm von Radowitz). U. S. 1,890,459, Dec. 13. The fecal matter is mixed with about 3–5% its wt. of an adsorbent material such as peat or lignite and the mixt. is heated to about 60° while agitated to effect absorption and adsorption of fertilizing solids and gases; solid matter is allowed to settle out, liquid is removed and the solid material is centrifuged to sep. residual liquid, and inorg. fertilizing substances are pptd. from the sepd liquids. An arrangement of app. is described.

**Insecticides.** VICTOR A. SEBASTIAN. Fr 737,963, Sept. 28, 1931. A combination of an alkali alkylsulfonaphthenate, its derivs. or homologs, with an appropriate amt. of pyridine and talc or S is used as an insecticide for plants, etc. It may be used along with Cu compds. for treating vegetables.

**Insecticides.** BRUNO FULLONI. Fr. 738,051, June 2, 1932. Colloidal $Al(OH)_3$ is used as an insecticide and anticryptogamic agent.

**Insecticide.** HIDEZO KIMURA. Fr. 738,390, June 9, 1932. An insecticide is made by mixing dry, ground *Perilla frutescens* with an insecticide powder moistened with petroleum to which is added an oil obtained by the distn. of the leaves of *Gaultheria procumbens*, turpentine, Japan pepper oil and oil of peppermint.

**Fungicides, insecticides, etc.** SOCIÉTÉ ANON. ÉTABLISSEMENTS & LABORATOIRES GEORGES TRUFFAUT Brit. 364,046, Aug. 16, 1929. Fungicidal, etc., prepns. are obtained by mixing a water-sol. dye with a substituted amide of a fatty acid. The dyes may be derivs. of thiazine, oxazine, azines, indoanilines, thiazoles, quinoline, acridine, xanthene, di- or tri-phenylmethane or azo compds. The amides are preferably used as salts of HCl, oxalic, tartaric, benzoic or salicylic acids. They may be the acylated diamines of Brit. 219,304 (*C. A.* **19**, 523) or the $NH_4$ derivs. of Brit. 294,582 (*C. A.* **23**, 1909), examples being dimethyloleylaminoethylamine, methylethylstearylaminoethylamine, etc.

**Pulverulent disinfectants.** MAX ENGELMANN (to E. I. du Pont de Nemours & Co.). U. S. 1,890,774, Dec. 13. Reaction is effected, by grinding in the dry state, between an aromatic cyclic compd. such as a cresol and a Hg compd. such as HgO or $HgCl_2$ for obtaining directly in dust-like form a mercurized product suitable for treating seeds, etc.

**Spreader and emulsifier for horticultural spray compositions, etc.** FRANK F. LINDSTAEDT (to Hercules Glue Co.). U. S. 1,890,158, Dec. 6. A compn. contg. oil is used with the reaction product of an amine such as an ethanolamine and a fatty acid, for improving the spreading of the oil on the object sprayed and a free amine such as an ethanolamine for controlling the penetration of the oil.

**Weed killers.** CHEMISCHE FABRIK LUDWIG MEYER. Fr. 738,377, June 9, 1932. A weed killer is made by grinding mixts. of $CuSO_4$ and NaCl at a raised temp. until the salts react to give a yellowish green to green powder.

# 16—THE FERMENTATION INDUSTRIES

C. N. FREY

**The chemistry of alcoholic fermentation.** KARL MYRBÄCK. *Svensk. Kem. Tids.* **44**, 207–22(1932).—A lecture. A. R. ROSE

**New methods of alcohol recovery.** KURT W. GEISLER. *Z. Ver. deut. Ing.* **77**, 126–8(1933).—A discussion of the principles and practicability of new methods of prepn. of EtOH from potatoes, peat, wood, $C_2H_2$ and $C_2H_4$. PHILIP D. ADAMS

**Acetic fermentation and oxidation of higher alcohols in sugar-free culture fluids.** HANS MOSEL. *Zentr. Bakt. Parasitenk. II Abt.* **87**, 193–229(1932).—Acetic bacteria can utilize alc. both as a building material and as a source of energy by oxidizing it to AcOH. Alc. (1–4%) with asparagine as a source of N makes a good culture medium for acetic bacteria. The resulting AcOH is also utilized. Growth is delayed by 8% alc. and the yield of acid reduced about 50%. AcOH (1.72%) makes a better medium for these organisms than alc. If both are present, the organisms select the most easily utilizable first. The presence of sugars protects the AcOH from oxidation. Methyl and isopropyl alcs. are not utilized. Propionic, butyric and isobutyric acids are used. JOHN T. MYERS

**Trimethylene glycol fermentation.** C. H. WERKMAN, C. W. DAVIS AND C. A. TARNUTZER. *J. Bact.* **25**, 33(1933).—The addn. of fumaric acid prevented the formation of the glycol from glycerol, and aeration also inhibited it, probably by acting as an H acceptor. *Escherichia coli* does not ferment glycerol in a mineral medium under anaerobic conditions, whereas the addn. of a suitable H acceptor as peptone, asparagine, AcH or fumaric acid starts the fermentation. JOHN T. MYERS

**The fermentation of acetoin [acetylmethylcarbinol].** L. M. HOROVITZ-VLASSOVA AND E. A. RODIONOVA. *Zentr. Bakt. Parasitenk. II Abt.* **87**, 333–9(1933).—Acetoin is fermented by a variety of bacteria, esp. the *subtilis*, *aerobacter* and lactic acid groups It is formed from a variety of polysaccharides, glycerol, etc., as well as from glucose Butylene glycol also appears and may be oxidized to biacetyl Old potato cultures contain a large amt. of biacetyl coming from the oxidation of acetoin and butylene glycol. JOHN T. MYERS

**Effect of hydrocyanic acid and carbon monoxide on butyric acid fermentation.** WALTER KEMPNER. *Biochem. Z.* **257**, 41–56(1933).—The heavy-metal catalysis of respiration has been proved by the fact that CO suppresses the respiratory enzyme reversibly, and at ordinary temp. only heavy metals unite with CO. For fermentation, which is an intramol. type of respiration, no influence of CO could be established, although the fermentation enzyme, just as the respiration enzyme, can form a dissociable compd. with HCN. However, the sensitivity of respiration to HCN is much greater than that of either lactic acid or alc. fermentation. Studies of the metabolism of butyric acid bacteria, however, show that butyric acid fermentation is suppressed by HCN to the same extent as the respiration, and likewise that this fermentation is also inhibited by CO. After removal of the CO the fermentation starts again; so in this case also the CO forms a reversible compd. Conclusion: Butyric acid fermentation is catalyzed by heavy metals. S. MORGULIS

**Mechanical equipment for continuous fermentation of fibrous materials.** A. M. BUSWELL AND C. S. BORUFF. *Ind. Eng. Chem.* **25**, 147–9(1933).—The drum digester described continuously ferments cornstalks, straw, manure, packing-house refuse, sewage screenings, etc., evolving per lb. feed 2.9–7.0 cu. ft. of gas with methane content of 50–59%. R. M. BOARTS, JR

**The artificial ripening of spirituous liquors by means of catalysts.** GÉZA TÓTH *Magyar Chem. Folyóirat* **38**, 129–34(1932).—Vapors of spirituous liquors were treated with finely dispersed metal oxides (CuO, NiO, $TiO_2$) at 150–80°. The oxidation coeff. of Lusson increased and taste was improved. The method can be applied to the ripening of cold-made liqueurs also. S. S. DE FINÁLY

**The Pulfrich photometer and its application in brewing and malting.** F. WEIHE MANN. *Brauer- Hopfen-Ztg. "Gambrinus"* **59**, 223–7(1932); *Schweizer- Brauer-Rundschau* **43**, 115–19.—The instrument is briefly described; its application for detn. of color, turbidity and $p_H$ in wort and beer is outlined. S. LAUFER

**Tannin in enology.** P. BALLARD. *Rev. vit.* **75**, 236–7(1931).—Tannin is often indispensable in treating wines and musts for a better color fixation, a more rapid and complete defecation and a more certain preservation. Nut gall tannin of a creamy white color, with only a slight odor and of astringent taste, is best. $H_2O$, alc. and ether solns. for which specifications are given may be used. F. W. MARSH

**Organic acids of wines and fruit juices, natural or fermented. I. Definition of the acidity and determination of organic acids.** L. SEMICHON AND M. FLANZY. *Ann.*

*agron.* [N. S.], **2**, 199–214(1932).—A method for detg. free org. acids by the action of wines or fruit juices on $CaCO_3$ and the detn. of the residual $CaCO_3$ is described and compared with 6 others. $p_H$ gives no measure of the actual amt. of acid present. Total acids were detd. by combining the results from the above method with those from analyses for salified acids and esterified ethers. F. W. MARSH

**Organic acids of wines, grape musts and fruit juices, natural or fermented. II. The volatile fatty acids.** L. SEMICHON AND M. FLANZY. *Ann. agron.* [N. S.], **2**, 504–28 (1932); cf. preceding abstr.—Aq. solns. of volatile fatty acids were analyzed by the measurement of $CO_2$ liberated from an excess of $CaCO_3$. Methods of extg. the fatty acids are critically discussed. Detn. of such acids by fractional or successive distns. does not give the total of acids in a free state. The official method by evapn. is insufficient. The entrainment in $H_2O$ vapor may give all the free volatile acids, but absorption by wine colloids may interfere. The entrainment by $H_2O$ vapor after satn. and sapon. with lime may give exact results. Methods of separately detg. formic, butyric, propionic, acetic and higher fatty acids are given. The results confirm the authors' previous judgment that total org., fixed and volatile acids are more important in wine analyses than free acids. F. W. MARSH

**Wines from dried grapes and natural wines. Their differentiation.** N. GEORGIADÈS BEY. *Bul. Institut Égypte* **14**, 83–93(1932).—With present methods it is impossible to differentiate between the 2 types of wine. The molybdate method, involving reducing substances in the wines, was inconclusive. F. W. MARSH

**The wines of vines treated with alum.** E. HUGUES. *Prog. agr vit.* **98**, 276–7 (1932).—H. discusses the possibility of the presence of Al in wines due to its presence on grapes from vines treated with alum. F. W. MARSH

**Color in wine making.** M. SAUZEAT. *Rev vit.* **77**, 125–6(1932).—Color of wine is increased by heating or by adding $H_2SO_3$ during vinification. F. W. MARSH

**Clarification of wine.** LAJOS VÁSONY *Mezögazdasági Kutatások* **5**, 293–302 (1932).—The theory of Rüdiger and Mayr (*C. A.* **23**, 3537) is discussed. Some form of chem. binding must exist between gelatin and tannin. Pectin acts as a protective colloid in the presence of small quantities of clarifying agent. Pptn. occurs only on application of much clarifying matter. The pear wine used by Rüdiger and Mayr contained much pectin and thus required much gelatin. If, on the other hand, too much gelatin is used, the excess gelatin which is not bound by the tannin content acts again as a protective colloid. Good results were obtained by applying casein dissolved in lukewarm $KHCO_3$ or citric acid. S. S. DE FINÁLY

**Effect of the distillation method on the composition and quality of wine distillates.** H. WÜSTENFELD AND C. LUCKOW. *Z. Untersuch. Lebensm.* **63**, 542–55(1932).—The quality of the distillates depends to a great extent on the distn. method, while the analytical values are less influenced. Numerous characteristics are given for the different fractions obtained. S. LAUFER

**The extractives of rum.** E GABRIEL JONES. *Analyst* **58**, 89(1933); cf. Partridge, *C. A.* **27**, 559, and Williams, *C. A.* **1**, 2021. W. T. H.

**Putrefactive odor of saké. I.** YUKIO TOMIYASU. *J. Agr. Chem. Soc. Japan.* **8**, 905–8(1932).—During the preservation of saké a disagreeable odor is sometimes produced by putrefaction; it is due chiefly to biacetyl, which may be formed by the oxidation of 2,3-butylene glycol and acetone by the putrefactive bacteria of saké. Y. KIHARA

**Decomposition of amino acids by yeast. I.** MASAKAZU YAMADA. *J. Agr. Chem. Soc. Japan* **8**, 428–32(1932) —Asparagine in Hayduck soln. was replaced by a N compd. such as glycine, *d*-alanine, *dl*-alanine, the Na salt of glutamic acid, *l*-leucine, α-aminobutyric acid, norvaline and $(NH_4)_2SO_4$. The soln. was fermented by saké yeast. Leucine, glycine, alanine and α-aminobutyric acid affect the production of fusel oil. Traces of fusel oil were found with valine and norvaline, and none at all with asparagine, glutamic acid and $(NH_4)_2SO_4$. It was preferable to use a small amt. of yeast for the production of fusel oil. The growth of the yeast was retarded in the case of valine. **II.** *Ibid* 498–505.—A culture soln. contg. glucose, 0.4% *d*-alanine and Hayduck mineral soln. was fermented by saké yeast. From the fusel oil obtained, isobutyl alc. and a small amt. of amyl alc. were isolated. When *dl*-alanine was added, the same result was obtained and *l*-alanine was recovered. When *dl*-alanine and alc. yeast were used, isobutyl alc. was also obtained. When a large amt. of beer yeast was used and the fermentation was rapid, only amyl alc. was obtained. **III.** *Ibid* 506–8.—Asparagine in Hayduck's soln. was replaced by *dl*-α-aminobutyric acid, and the soln. was fermented with saké yeast for 11 days. The main part of the oil obtained from the fermentation products was a higher alc. b. 123–8°, identified as active amyl alc. Propyl alc. could not be found. The amino acid recovered from the distn. residue had $[\alpha]_D^{32} = -1.14°$ (in 20% HCl soln.). Y. KIHARA

Separation of the 2 malt amylases by sorption (HOLMBERGH) **11A.**

FRANCHE, G.: **Le maçon.** Paris: Dunod & Cie. 500 pp. F. 30.

**Distillation apparatus for alcohol.** FRANÇOIS GOAVEC. Fr. 737,768, May 28, 1932.

**Alcohol from ethylene.** THE DISTILLERS CO., LTD., WALTER P. JOSHUA and HERBERT M. STANLEY. Brit. 364,221, Oct. 21, 1930. The process of 360,492 (Fr. 721,159 (*C. A.* **26**, 4067)) is modified by absorbing $C_2H_4$ in $H_2SO_4$ in the presence of a solid or liquid inert substance having power of increasing the contact surface between the reactants. Pumice, porcelain fragments, finely divided C, silica gel and refined emulsified mineral oil are mentioned as such.

**Arylacetylcarbinol derivatives.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,702, Oct. 15, 1930. Optically active hydroxyarylacetylcarbinols and arylmethoxyarylacetylcarbinols are prepd. by fermenting with yeast a carbohydrate in the presence of an aromatic aldehyde contg. in the nucleus a free OH, an acylated OH or an arylmethoxy group, with or without other substituents, *e. g.*, a methoxy group, and, if required, splitting off any acyl or arylmethyl group present in the product. Among examples grape sugar is fermented in presence of *m*-acetylhydroxybenzaldehyde producing *l,m*-hydroxyphenylacetylcarbinol.

**Beverages.** SEITZ-WERKE G. M. B. H. Fr. 738,005, June 1, 1932. Beer and wine are pasteurized, cooled, filtered through sterilized filters and introduced into sterilized containers.

**Apparatus for brewing beverages.** STACEY A. HAINES. Brit. 363,393, Aug. 19, 1929.

---

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

**Some physical incompatibilities of the pharmaceutical preparations.** ANTONIO ANGELETTI. *Ann. Schiapparelli* **6**, 191–4(1932).—The melting curves of the mixt salol-methylacetanilide are examd. The mixt. contg. 79% salol m. at 29°, *i. e.*, at lower temp. than that of pure salol (42°). G. A. BRAVO

**The biological significance of the essential oils in the Gramineae.** FRANCESCO BRUNO. *Lavori ist. botan. Palermo* **2**, 70–83(1931).—Among the Gramineae, only some species of *Cymbopogon* and of *Vetiveria* contain essential oils in the assimilation tissues. The oil is a reserve material and their content reaches a max. during the flowering. **The transformation and utilization of odoriferous compounds during the flowering and fructification, in some Andropogonaceae.** *Ibid* **3**, 1–9(1932).—The essence obtained from the leaves of *Cymbopogon martini* Stapf. var. Sophia, *C. proximus* Stapf. and *C. stipulatus* Chiov. were examd.; these essences gave, resp.: d. 0.9254–0.9762, 0.9344–0.9614, 0.9428–0.9665; *n* 1.4845–1.4973, 1.4869–1.4892, 1.5192–1.5206; acidity 2.0–3.3, 0.1–1.95, 0.07–0.1; ester no. 65.33–84.00, 21.13–54.13, 24.26–39.20. The max. of oil content in the leaves is just before the flowering, the min. during the ripening of the seeds. In this period, the oil content is max. in the flowers. **Researches on the Cymbopogon stipulatus.** *Ibid* 10–12.—The essential oil from the leaves gives: $[\alpha]$ —30° 22′, soly. in 80% alc. 1:10, ester no. after acetylation 28.9. G. A. BRAVO

**Bismuth salts soluble in the oils.** GASPARE CARLI. *Officina* **5**, 210–12(1932).—The methods of prepn. and control of Bi hexahydrobenzoate, Bi camphocarbonate, etc., are described. G. A. BRAVO

**Indifferent fluidextracts according to the Italian Pharmacopeia V.** MARIE PERRINO. *Officina* **5**, 212–14, 277–89(1932); cf. *C. A.* **26**, 3327.—A criticism of the methods of control prescribed by the Ital. Pharm. V. Comparative detns. of the properties and consts. of several com. samples of fluidexts. of boldus, senega, sarsaparilla, rhubarb, valerian and viburnum. G. A. BRAVO

**Changes and keeping qualities of the sirups of $FeI_2$.** EMILIO PAJETTA. *Officina* **5**, 261–7(1932).—The sirups contg. $FeI_2$ may be oxidized by atm. $O_2$ and ferric salts form; this oxidation is greater in the sirups contg. $H_3PO_3$ than in the sirups contg. citric acid; and it is increased by temp. The inversion of sucrose is more rapid in the sirups contg. $H_3PO_3$. G. A. BRAVO

**Investigations on the Nigella damascena L.** GAETANO OTTOLINO. *Officina* **5**, 273–6(1932).—The oil from the seeds (32–40%) extd. with $Et_2O$ is greenish yellow

with blue-violet fluorescence (very intense in Wood's light), sol. in $C_6H_6$, $CCl_4$, $CHCl_3$; sapon. no. 230, acids calcd. as oleic 41.73, ester no. 146.68, volatile fatty acids 4.4, non-volatile 83.62, m. p. 10–12°, solidifying p. —16° to —20°. G. A. BRAVO

**The hypochlorites as disinfectants [disinfectants and foodstuffs].** H. RAWLINSON. *Chemistry and Industry* **1933**, 71–4.—A brief review of the value of disinfectants. Cleanliness is the first and foremost essential. F. L. DUNLAP

**Rapid method for essential oil determination.** P. VALAER. *Spice Mill* **55**, 1410 (1932).—This method may be applied to all flavoring exts. contg. oil, except cinnamon, cassia, cloves and almond. Pipet 10 cc. of sample into a Babcock milk bottle. For samples contg. over 5% oil use only 5 cc. Add 2.5 cc. of mineral oil mixt. (1 part mineral oil U. S. P. and 1 part kerosene, water-free), 1 cc. of 1:1 HCl and fill to the shoulder with satd. $MgSO_4$ soln. Shake 3 min. and add salt soln. to fill the graduated neck. Centrifuge 10 min. at high speed and read the percentage from the extreme bottom to the extreme top of the oil column. Subtract 2.5% for mineral oil correction and multiply by 2 for percentage by vol. Multiply by 4 if 5 cc. sample was used. For analysis of cinnamon, cassia and clove exts., after adding the ext. to the bottle, remove nearly all the alc. by blowing air through a small tube down the neck of the bottle. Then add 1 cc. of the mineral oil mixt., fill with satd $MgSO_4$ soln. and centrifuge for 10 min. From the oil reading subtract 5 for the oil added and multiply by 2. The results compare favorably with those obtained by the A. O. A. C. methods. F. L. DUNLAP

**Decrease of ethereal oil content of ground cinnamon during storage.** ISTVÁN HORVÁTH. *Kísérletugyi Közlemények* **35**, 114–17(1932).—Of 8 samples of cinnamon stored in closed glass tubes for 1 year, 2 samples showed no change in content of ethereal oil and 6 samples showed a decrease of 2–8%. Samples stored in open paper sacks showed losses of 11–33%. S. S. DE FINÁLY

**Titrimetric determination of pyramidone in presence of antipyrine, acetanilide phenacetin, caffeine, etc.** ELEMÉR SCHULEK AND PÁL MENYHÁRTH. *Magyar Gyógyszerésztud. Társaság Értesitoje* **8**, 399–410(1932).—Dissolve material contg. 30–50 mg. pyramidone in 10 cc. water in a 500-cc. Erlenmyer flask, add 350 cc. $H_2O$ and a vol. of 0.1 *N* NaOH equal to the vol. of 0.1 *N* $KMnO_4$ required for the later oxidation. Add excess 0.1 *N* $KMnO_4$ + 1 g. KI and shake, then add 10 cc. 50% $H_2SO_4$ and titrate with 0.1 *N* thiosulfate soln. using starch soln. as indicator $KMnO_4$ should be added at once, not in drops. One cc. thiosulfate = 5.779 mg. pyramidone. Also a micro method was developed in which 3–5 mg substance is treated as above and titrated with 0.01 *N* soln. Also in *Z. anal. Chem.* **89**, 426–39(1932). S. S. DE FINÁLY

**A characteristic reaction of papaverine.** LÁSZLÓ EKKERT. *Magyar Gyógyszerésztud. Társaság Értesitoje* **8**, 411–13(1932).—A mixt. of 0.01 g. papaverine or papaverine-HCl, 0.02 g. dry $ZnCl_2$ and 5 drops BzCl on heating becomes rose-red to blood-red, changing to yellow with greenish fluorescence. The cooled soln. becomes greenish yellow on addn. of 1–2 drops alc. and the fluorescence becomes stronger. S. S. DE FINÁLY

**Examination of tinctures of Pharm. Hung. III in ultra-violet light.** ISTVÁN TEMPSVÁRY. *Magyar Gyógyszerésztud. Társaság Értesitöje* **8**, 444–56(1932).—Thirty different tinctures were exaind by the method of Zechner and Gstirner. Tincture absinthi, belladonnae, cannabis, digitalis and lobeliae were found to contain chlorophyll. S. S. DE FINÁLY

**Determination of starch in plant leaves, with special attention to change of alkaloid content.** MIKLÓS JANICSEK. *Mezogazdasági Kulatások* **5**, 283–92(1932).—The coloring and reducing substances are extd. from the leaves with alc. and the starch is detd. colorimetrically as I-starch. A soln. made from wheat starch is used as a standard. Expts. made with *Datura stramonium*, *Datura metel* and *Atropa belladonna* proved that the leaves should be gathered at night since they contain more alkaloids then, as the result of conversion of starch to sugar and migration to other parts of the plant at night. S. S. DE FINÁLY

**Theoretical composition of Eau de Cologne.** KURT HOCHSTETTER. *Anales quím. farm.* (Chile) **2**, 19–23(1933).—Discussion. L. E. GILSON

**Testing ampoule glasses.** D. v. KLOBUSITZKY. *Kolloid-Z.* **62**, 98–9(1933).—In all methods, the surface exposed should be related to alkali removal from the glass. All glasses showing a $p_H$ less than 9.5 when suspended in water are suitable. In the autoclave method, ampoules should be treated for at least 2 hrs. The suspension method is preferred in all cases where single specimens are to be tested. ARTHUR FLEISCHER

**Triethanolamine emulsions.** G. DE MAISON NAVARRE. *Am. Perfumer* **27**, 650–2 (1933).—A review. E. H.

**Determination of the power of adsorption of tablets of medicinal charcoal.** V. LANG AND L. RYBÁČEK. *Časopis Československ. Lékárnictva* **12**, 165–8(1932).—Of 3 com.

samples of medicinal charcoal tested for power of adsorption of methylene blue and $HgCl_2$ only one was active. WILLIAM J. HUSA

**Preparation of drugs for extraction in making tinctures.** ŠTĚPÁN DUBSKÝ. *Časopis Československ. Lékárnictva* **12**, 189–93(1932).—More complete extn. is obtained by swelling the drug with $H_2O$ before macerating with alc.-$H_2O$ mixt. WILLIAM J. HUSA

**Liberation of oxygen from Ichthoxyl.** EMIL PETRÁČEK. *Časopis Československ. Lékárnictva* **12**, 265–72(1932).—Under conditions similar to those of therapeutic application, $O_2$ is slowly liberated from Ichthoxyl, a patented therapeutic compn. prepared by adding a peroxide to ichthyol. WILLIAM J. HUSA

**The determination of morphine in opium and its official preparations.** ZDENĚK REKTOŘÍK. *Časopis Československ. Lékárnictva* **12**, 285–92(1932).—The time required for detn. of morphine in opium by the method of the Pharm. Neerl. V can be shortened. Agitation for 30 min. for opium, 25 min. for the ext. and 10 min. for the tincture suffices, the drug and ext. being first triturated for 15 min. with 15 cc. $H_2O$ and 0.35 g. CaO. Pptn. on addn. of $NH_4Cl$ is complete in the ext. and tincture in 3 hrs., in the drug in 8 hrs. WILLIAM J. HUSA

**Effect of sodium perborate on glycerol.** LUDVÍK RYBÁČEK. *Časopis Československ. Lékárnictva* **13**, 41–6(1933); cf. *C. A.* **25**, 5143.—Solns. of $NaBO_3$ in glycerol must be made in the cold to avoid formation of HCHO; stability of the soln. is increased by neg catalysts such as phenacetin. The effect of $H_2O_2$ and of $NaBO_3$ on the sensitivity of reactions of HCHO was studied. WILLIAM J. HUSA

**The preparation and stability of Pregl's solution.** VLADIMÍR LANG. *Časopis Československ. Lékárnictva* **13**, 47–51(1933).—Pregl's soln. of highest stability was prepd. by using $NaHCO_3$, distd. $H_2O$ free from org. matter and satd. with $CO_2$, and preserving in bottles of brown, neutral glass. WILLIAM J. HUSA

**Polarographic determination of the effect of air on solutions of arsphenamine.** RUDOLF BRDIČKA. *Časopis Československ. Lékárnictva* **13**, 51–62(1933).—The amt. of Na and of traces of oxidation products in arsphenamine can be detd polarographically. WILLIAM J. HUSA

**Determination of minute quantities of morphine and opium.** A. D. ROZENFELD *Farm. Zhur.* **8–9**, 246–51(1932).—(I) $HIO_3$ (1 cc. of 5% soln.) and $NH_4OH$ (0.2 cc. of 10% soln.) are used with 2 cc. of weakly acid sample. It is compared with a standard soln. in a colorimeter after 2 and 5 min. (II) The sample (3 cc.), 1 drop of $CuSO_4$ in HCl, 0.2–0.4 cc. of $H_2O_2$ and 0.2 cc. of $NH_4OH$ are compared with a standard after 15–20 min. Tables are given. L. NASAREVICH

**A correction of the pharmacopeia article "kalium aceticum solutum."** M. B SHVARTZMAN. *Farm. Zhur.* **10**, 292–4(1932).—It is recommended, after ignition to $K_2CO_3$, to use Kolthoff's titration with 0.5 *N* HCl and tropeolin 00 (0.1% soln.) as indicator. L. NASAREVICH

**Alkaloids from Leontice ewersmani.** A. P. OREKHOV AND R. A. KONOVALOVA *Khim. Farm. Prom.* **10**, 371–5(1932).—Dried bulbs of *Leontice ewersmani* contained about 0.4% of alkaloids, from which *leontamine*, $C_{14}H_{26}N_2$, was sepd.; its hydrochloride, diiodomethylate, chloroplatinate and picrate were crystd. and studied. *Leontidine*, colorless rhombic plates m. 116–8°, was also sepd. L. NASAREVICH

**Determination of arsenic in medicinal preparations.** E. S. BINOVA AND R. L RAIHORODSKA. *Farm. Zhur.* **11–12**, 335–7(1932).—The method is a modification of Bek-Merez's method and is based on the coloration of $HgBr_2$ paper with evolved $AsH_3$ L. NASAREVICH

**Prolan; its physicochemical properties.** A. MOGILSKII. *Farm. Zhur.* **11–12**, 337–8(1932).—Prolan is an amorphous brownish powder of albuminous nature; it gives biuret and glyoxylic acid reactions. It ppts. with tannins, colloidal Fe and Pb $(OCOCH_3)_2$, does not coagulate on heating or ppt. with $CCl_3COOH$, $C_6H_3OH(SO_3H)$-COOH and $C_6H_2(NO_2)_3OH$. It is salted out by concd. $(NH_4)_2SO_4$. L. N

**Recent advances in disinfectants and antiseptics.** EMIL KLARMANN. *Soap (Insecticide and Disinfectant Sect.)* **9**, No. 2, 87–9(1933); cf. *C. A.* **26**, 2212.—A review of the past year's literature, with 43 references. HENRY H. RICHARDSON

**Some tests on disinfectants.** C. C. BAIRD. *Soap (Insecticide and Disinfectant Sect.)* **9**, No. 2, 89(1933).—Phenol coeffs. obtained on coal tar and cresol disinfectants by Rideal-Walker, Hygienic Lab., and Food and Drug Administration (F. D. A.) methods did not differ greatly. The F. D. A. test is simpler to perform and is recommended for adoption as a standard. HENRY H. RICHARDSON

**Report of committee on standardization of disinfectants.** WM. DREYFUS. *Soap (Insecticide and Disinfectant Sect.)* **9**, No. 1, 90(1933); cf. *C. A.* **26**, 2012.—The Hygienic Lab. phenol coeff. method (A) checked well with the Food and Drug Administration

method in tests of $HgI_2$.KI soln. against *Eberthella typhi* in the absence of org. matter. In the presence of org. matter the loss in coefficiency by *A* is greater. H. H. R.

**Nomenclature for the pharmacopeia.** J. K. GJALDBAEK. *Arch. pharm. Chem.* **40**, 53–69(1933).—The nomenclature of the Danish pharmacopeia is compared with that of Sweden, Germany and Gt. Britain. The discussion centers on serious ambiguity and international trends. A. R. ROSE

**Specific-gravity tables.** ANON. *Arch. Pharm. Chem.* **40**, 79–83(1933).—Pharmaceutical fluids and solns. are tabulated for sp. gr. at temps. of 8–22°. A. R. ROSE

**Essential oil from leaves of Litsae zeylanica, Linn.** B. SANJIVA RAO. *J Indian Inst. Sci.* **15A**, 71–4(1932).—The oil of the leaves of this evergreen tree consists of α-pinene 3.5, ocimene 60.0, terpene alcs 1.0, bicyclic sesquiterpenes 27.0 and sesquiterpene alcs. 3.0%. Phys. consts. are given. *Dihydroöcimene* (I), $b_{36}$ 70°, and identical with *dihydromyrcene*, was prepd. Its tetrabromide m. 87–8°. *Alloöcimene* was isolated from the fraction b. 112–3°. H. K. SALZBERG

**Essential oil from the flower-heads and stalks of Andropogon, Hack. var. Foveolata, Hack.** B. SANJIVA RAO. *J. Indian Inst. Sci.* **15A**, 75–7(1932).—This Indian grass yielded 0.27% (dry basis) of oil on steam distn., from which bicyclic tertiary sesquiterpene alcs. 40%, *l*-camphene 10% and small amts. of α-pinene and borneol were isolated. An isomeric form of camphene was also found. H. K. SALZBERG

**Essential oil from the leaves of Thymus serpyllum, Linn.** JAGIJT SINGH AND B. SANJIVA RAO. *J. Indian Inst. Sci.* **15A**, 78–83(1932).—This variety of thyme was gathered in the Punjab and Kashmir. Its consts. resemble those of the valuable French oil more closely than the values given for *T. serpyllum* oil obtained elsewhere. It was found to contain phenols (mainly carvacrol) 53, *p*-cymene 17, γ-terpinene 8, borneol and α-terpineol 5 and zingiberene 4%. Thymol could not be identified. H. K. S.

**Essential oil from the leaves of Cinnamomum zeylanicum, Breyn.** V. P. SHINTRE AND B. SANJIVA RAO. *J. Indian Inst. Sci.* **15A**, 84–7(1932).—The leaves of this tree found in Mysore yield 0.25% (dry basis) of an oil contg. *l*-α-pinene and *l*-β-phellandrene 4, α-terpineol 3, eugenol 15, α-caryophyllene 62 and sesquiterpene alcs. 7%. H. K. S.

**Italian lavender oil.** LINA SORRIDENTE. *Riv. ital. essenze, profumi* **14**, 306–9 (1932).—A sample of the oil, obtained with improved distn. plant, had $d_{15}$ 0.8875, $[\alpha]_{20}$ —7° 44′, $n_{20}$ 1.4610, acid no. 0.18, ester no. 117.626, total esters as linalyl acetate 41.17%, soly. in 70° alc. 1:3.5 at 25°. R. SANSONE

**The essential oil from the Italian mastic tree.** PAOLO ROVESTI. *Riv. ital. essenze, profumi* **14**, 357–63(1932).—The leaves yielded with $CCl_4$ 0.512, with $C_6H_6$ 0.560 and with petr. ether 0.488% of concrete essence, which on treatment with warm 97° alc., filtration at —10°, and evapn. of the alc. gave 0.302, 0.274 and 0.252%, resp., of abs. oil, $d_{15}$ 0.9874, 0.9776, 0.9655; $[\alpha]_D^{20}$ 1° 21′, 0° 54′, 2° 08′; $n_D^{20}$ 1.4713, 1.4723, 1.4708; acid nos. 5.60, 3.73, 1.87; ester nos. 76.78, 70.93, 80.27; acetate of $C_{10}H_{18}O$ 26.78, 24.82, 28.09%; sapon. nos. after acetylation 106.40, 97.07, 113.87; free $C_{10}H_{18}O$ 8.40, 7.32, 9.48%; combined 21.04, 19.50, 22.07%; I nos. 53.2, 71.3 48.9. On distn. with steam and reduced pressure the abs. essences yielded 21.2, 18.3 and 20.7%, resp., of ethereal oil. A brown-green oil (23.3%) was obtained from the fruits. At —3° there sepd. 13.2% solid fatty acids, wax and resin. The limpid oil (86.8% of the crude oil obtained with $CCl_4$), green-yellow, had $d_{15}$ 0.9198, $n_D^{20}$ 1.4686, Maumene no. 49, acid no. 16.80, sapon. no. 201.60, I no. 94.3, sapon. no. of fatty acids 188, unsaponifiable 13.3%. Evapn. and condensation of the vapors gave 0.68% of an essential oil of $d_{15}$ 0.8774, $[\alpha]_D^{20}$ 1°18′, $n_D^{20}$ 1.4713, soly. in alc. 90% at 20° 1:2.3. This produces the resinous taste of mastic-tree oil. The vaporized oil was nearly without taste or odor. R. SANSONE

**Dielectric constants of ethereal oils in relation to their constitution and their constituents.** T. G. KOVALEV AND V. V. ILLARIONOV. *J. prakt. Chem.* **135**, 305–26 (1932).—Many data are given regarding the change in the values of ε, d. and $n_D$ of ethereal oils by the action of air and light (I) and of moisture and light (II) over a period of 3 months. In this abstr. only the values of ε are given for the fresh oil and for the oil at the end of the expt. Russian anise oil, 3.692, 9.850 at 15° and 27° (I); 3.808, 4.742 at 16° and 28° (II). Balm oil, 4.689, 8.214 at 15° and 27° (I); 5.183, 4.711 at 16° and 22° (II). Russian peppermint oil, 6.573, 9.183 at 16° and 27° (I); 6.432, 6.807 at 17° and 28° (II). Lavender oil, 5.212, 7.912 at 17° (I); 5.412, 5.364 at 16° and 14° (II). Italian citronella oil, 3.233, 9.326 at 16° and 27° (I); 2.870, 2.689 at 17° and 28° (II). Russian turpentine oil, 2.555, 6.656 at 26° and 10° (I); 2.632, 2.465 at 20° and 16° (II). Italian bergamot oil, 4.083, 4.696 at 17° (I); 4.083, 4.137 at 17° and 13° (II). Cassia oil, very high (above 11). Clove oil, 8.282, 7.949 at 15° and 27° (I); 8.905 and 7.521 at 16° and 28° (II). East Indian sandalwood oil, 5.031, 4.914 at 17° (I); 5.031, 5.364 at 17° and 14° (II). Eucalyptus oil, 4.990, 4.861 at 17° (I);

4.990, 4.884 at 17° and 14° (II). The detn. of this const. will be of value in detg. the purity and freshness of oils. C. J. WEST

**Therapeutic agent for treating mucous membranes of the nose, mouth and respiratory tract.** ALLEN L. OMOHUNDRO (to Frederick Stearns & Co.). U. S. 1,890,860, Dec. 13. An emulsion is prepd. contg. oil and water together with a therapeutic substance such as ephedrine or a similar material which has a vaso-constrictive action and is dissolved in one of the constituents of the emulsion.

**Organoarsenic compounds.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,026, Oct. 27, 1930. Complex metallic compds. of 3,4-dihydroxybenzenearsonic acid, water-sol. and therapeutically valuable, are prepd. by treating a soln. of a salt of the arsonic acid with an oxide or hydroxide of Cu, Bi, Sn, Mo, Al, Co, Ni or As, or by adding a soln. of a salt of said metals to the arsonic acid soln. and dissolving the whole by means of an alkali or base. The products are sepd. in the usual manner, *e. g.*, by adding $Et_2O$ or acetone.

**Organomercury compounds.** I. G. FARBENINDUSTRIE A.-G. [illegible]1, Oct. 23, 1930. Organo-Hg compds. are prepd. by treating a xanthine deriv., contg. an unsatd. side chain, with a Hg salt. The products contain the Hg compd. attached to the former double bond and have therapeutic properties. Examples are given of the treatment of 1-allyltheobromine, 7-allyltheophylline, 1-allylmethyltheobromine and 7-allylmethyltheophylline with $Hg(AcO)_2$ and 1-allyltheobromine with $HgCl_2$. The conversion of $Hg(AcO)_2$ compds. into the corresponding $HgCl_2$ compds. by reaction with NaCl is also described.

**Alkali metal salts of 5,5-dialkyl substituted barbituric acids.** HORACE A. SHONLE (to Eli Lilly & Co.). Brit. 364,041, June 22, 1929. See U. S. 1,856.792 (*C. A.* **26,** 3517).

**Bismuth compound for treating neurosyphilis.** PAUL J. HANZLIK (to the Board of Trustees of The Leland Stanford Junior University). U. S. 1,890,508, Dec. 13. For producing a Bi compd. in anionic form suitable for therapeutic use, a halogen salt such as NaI is reacted with a Bi salt such as Bi chloride in soln. to form a salt of bismuthous acid and a substantially insol. residue, the residue is filtered off, and the filtrate is evapd. and the crystd. salt thus formed is purified by washing with ether. EtOAc may be used as a solvent

**Colloidal sulfur preparations.** JACOB MROCHEM and PAUL MOCHALLE. Brit. 364,061, Sept. 30, 1929. See Ger. 543,603 (*C. A.* **26,** 3335).

**Acridine derivatives.** WERNER SCHULEMANN, FRITZ MIETZSCH and AUGUST WINGLER (to Winthrop Chemical Co). U. S. 1,889,704, Nov. 29. Pharmaceutical compds., acridine derivs. contg. the $(N_x—R_1—NR_2R_3)_n$ groups, where $x$ stands for H and alkyl, $R_1$ stands for an alkylene radical which may be substituted by a hydroxy group, and $R_2$ and $R_3$ stand for alkyl groups which may be substituted by an amino group, $n$ stands for 1 and 2 and where all nuclei may be further substituted by substituents of the group consisting of alkyl, alkoxy, phenyl and halogen, may be obtained by the reaction of an amino deriv. of an acridine with an aminoalkyl halide of the general formula $y—R^1—R^2—R^3$ in which $y$ represents a halogen atom, $R^1$ an alkylene radical in which the H atoms may be substituted by a univalent substituent such as OH, and $R^2$ and $R^3$ stand for H or alkyl groups which may be substituted, *e. g.*, by amino groups. Alternatively, the salt of an aminoalkyl halide with an inorg. acid or a substitution product of the aminoalkyl halide such as the bromoethylphthalimide may be used instead of the aminoalkyl halide, with subsequent splitting off of phthalic acid; or amino compds. suitable for use as intermediates for the manuf. of amino derivs. of the acridine may be converted into aminoalkylamino derivs. and the latter then transformed into the corresponding acridine compds. Examples are given of the production of 3,6-bis(diethylaminoethylamino)acridine and some other related compds.

**Urea and thiourea derivatives.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,640, Oct 23, 1930. See Ger. 553,278 (*C. A.* **26,** 4683).

**Pyridine compounds.** I. G. FARBENIND. A.-G. Fr. 737,889, May 31, 1932. Easily sol. products for the radiographic representation of animal organs are obtained by transforming hydroxy- or keto-halopyridines substituted by acid groups into salts with aliphatic amines. Thus, 3,5-diiodo-4-pyridone-*N*-acetic acid is transformed to its $NHEt_2$ salt. Other amines which may be used include 2-keto-3-methyl-4-dimethylaminobutane, 1-ethoxy-2-hydroxy-3-dimethylaminopropane, 1-diethylaminoethoxy-2-hydroxy-3-dimethylaminopropane, Et ester of diethylaminoacetic acid and 1,3-bis-diethylamino-2-hydroxypropane.

**Complex metal compounds of glucosaminic acid.** ARTHUR STOLL and ALBERT HOFMANN (to Chemische Fabrik vorm. Sandoz). U. S. 1,888,186, Nov. 15. See Ger. 564,437 (*C. A.* **27,** 1093). U. S. 1,888,187 relates to complex Sb glucosaminates such as may be prepd. by the interaction of glucosaminic acid with Sb hydroxides or by treating suitable salts of glucosaminic acid with tri- or penta-halo compds. of Sb. The products are stable and sol. in water.

**Contrast agent for radiography.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,346, July 9, 1930. As contrast agent is used a salt of iodomethanesulfonic acid, which may be substituted by aliphatic residues and (or) a further I atom. It is prepd. by reaction of an $\alpha$-haloacetic acid, or an aliphatic substitution product, with a neutral sulfite and treatment of the product with I at high temp.

**$\beta$-Dimethylaminoethyl ester of $p$-butylaminobenzoic acid.** OTTO EISLER (to Winthrop Chemical Co.). U. S. 1,889,645, Nov 29. The ester, consisting of colorless crystals m. 43° and which forms a hydrochloride m. 147–8° and a mononitrate m. 131–2°, is formed from 4-butylaminobenzoic acid and the hydrochloride of $\beta$-dimethylaminoethanol and is suitable for use as an anesthetic for lumbar and sacral anesthesia.

**Vitamins.** PAUL S. VOIGT. Brit. 364,113, Sept. 24, 1930. A and C vitamins for mixt. with winter food for animals are extd. from lemon peel with alc.

**Hydrofluoric acid and fluorides.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,424, Sept. 24, 1930. Anhyd. HF and salts thereof are made by treating the hydrous substances with F to decompose the water, forming HF and O or ozone. Cf. *C. A.* **27**, 812.

**Clay activation and hydrochloric acid manufacture.** CHESTER TIETIG. U. S. 1,890,474, Dec. 13. A mixt of H and Cl is burned in the presence of aq. vapor and of finely divided activatable clay.

**Nitric acid.** EMIL COLLETT. Norw. 49,864, Dec. 14, 1931. N oxides are absorbed in $H_2O$ or dil. $HNO_3$. The residual gases are dried by cooling or by aid of water-absorbing substances and are finally treated with concd. $H_2SO_4$ to absorb the remaining N compds. Cf. *C. A.* **27**, 1100.

**Concentrating phosphoric acid.** CYRIL B. CLARK (to American Cyanamid Co.). U. S. 1,889,949, Dec. 6. Weak acid obtained from the treatment of natural phosphates with $H_2SO_4$ is dehydrated by scrubbing with a heated gas contg. $P_2O_5$ while the impurities are removed from the gas during the scrubbing and the $H_3PO_4$ mist formed as a result of the scrubbing action is condensed by dry condensation to obtain concd. acid.

**Purifying phosphoric acid.** GEORGE F. MOORE (to U. S. Phosphoric Products Corp.). U. S. 1,889,929, Dec. 6. Crude $H_3PO_4$ is treated with an alkali such as $Na_2CO_3$ to form a soln. of di-alkali phosphate; this soln. is sepd. from insol residues and ppts and is treated with pure $CaSO_4$ to ppt. pure di-Ca phosphate; the latter is sepd. from the remaining soln. and treated with $H_2SO_4$ to form $H_3PO_4$, and the $CaSO_4$ simultaneously formed is recycled in the process.

**Sulfuric acid.** INDUSTRIKEMISKA AKTIEBOLAGET. Brit. 363,327, June 11, 1929 Void. See Fr. 697,173 (*C. A.* **25**, 2817).

**Sulfuric acid manufacture by the chamber process.** ERNEST B MILLER (to Silica Gel Corp.). U. S. 1,889,973, Dec. 6. N oxides escaping from the system are adsorbed in a porous material such as silica gel, and the porous material and adsorbed oxides in gaseous form are returned to the system. Various details of app. and operation are described.

**Denitrating waste sulfuric acid.** HARRY PAULING (FIRM OF) Brit 365,949, June 2, 1930. Waste acid comprising $HNO_3$, $H_2SO_4$ and dissolved nitro compds., as obtained in nitrotoluene manuf., is treated with such an amt. of steam, with or without hot gases, that the $HNO_3$ obtained in the condensing stage is of such concn., *e. g.*, 20-30% by wt., that complete sepn. of nitro-compds is attained by cooling. Alternatively the necessary concn. may be attained by dilg the condensed $HNO_3$. App. is described.

**Ammonia.** RENATO ZANIBONI. Fr. 737,796, May 30, 1932. An app. is described for converting $NH_4OH$ to pure anhyd. $NH_3$, by distg. the $NH_4OH$, absorbing it in a substance such as $NH_4CN$, and reheating to liberate the $NH_3$ which is condensed

**Ammonia from cyanamide.** PHILIP H. FALLER (to American Cyanamid Co U. S. 1,889,956, Dec 6. Cyanamide is treated with steam in a closed vessel to effect reaction, and when a temp. of about 160° is reached, the steam is cut off and only sufficient $NH_3$ is withdrawn from the chamber to enable the exothermic reaction to continue the temp is maintained at 160° or higher until the reaction is complete, and substantially all the $NH_3$ is removed while the charge is at a temp of 160° or higher.

**Nitrogen-hydrogen mixtures for ammonia synthesis.** RALPH S. RICHARDSON U. S. 1,889,934, Dec. 6. In purifying mixts. for $NH_3$ synthesis, the gas mixt. is washed with liquid N under pressure, the O in the washed gases is converted into $H_2O$ vapor with the aid of a catalyst such as Ni or Cu, and substantially the same pressure is maintained on the gases during the washing and catalytic-conversion steps; water vapor is removed from the gases, and they are then passed to an $NH_3$-synthesis app operating under a pressure greater than that of the washing step.

**Alkali salts.** SOC. D'ÉTUDES POUR LA FABRICATION ET L'EMPLOI DES ENGRAIS CHIMIQUES (Louis Hackspill, Antoine Rollet and Louis Andres, inventors). Fr 738,425, Oct. 3, 1931. An alkali salt is made by introducing an alkali chloride and the corresponding $NH_4$ salt into the mother liquors from a preceding operation, in the presence of an excess of free $NH_3$ so as to ppt. the alkali salt. The excess of $NH_3$ is removed from the liquor to ppt. $NH_4Cl$ corresponding to the amt. formed.

**Alkali chromates.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,423, Sept. 24, 1930 See Ger. 544,618 (*C. A.* **26**, 3629).

**Alkali nitrates.** NORSK HYDRO-ELEKTRISK KVAELSTOF-AKTIESELSKAB (Henry Johnsen, inventor). Fr. 738,253, June 7, 1932. $Ca(NO_3)_2$ is passed through one or more towers filled with base-exchange substances, *e. g.*, an alkali permutite to form Ca permutite. The permutite is regenerated by passing alkali chloride soln.

**Alkali nitrates.** NORSK HYDRO-ELEKTRISK KVAELSTOF-AKTIESELSKAB (Henry Johnsen, inventor). Fr. 738,304, June 8, 1932. Alkali nitrates and $CaCl_2$ are made by absorbing nitrous gases in a soln. of alkali carbonate, transforming the soln. thus formed with $(NH_4)_2CO_3$ into alkali carbonate and $NH_4NO_3$ by means of zeolite, decomposing the

soln. of $NH_4NO_3$ with CaO or $CaCO_3$, and transforming the soln. of $Ca(NO_3)_2$ with alkali chloride by means of zeolite to form alkali nitrate and $CaCl_2$.

**Alkali thiosulfates.** Société des usines chimiques Rhône-Poulenc. Brit. 365,999, Sept. 26, 1930. See U. S. 1,854,762 (*C. A.* **26**, 3339).

**Higher oxides of alkali metals.** George F. Jaubert. Fr. 738,418, Oct. 2, 1931. A mixt. of $Na_2O_2$ and $K_2O_4$ in light heterogeneous pieces for revivifying air by filtration is obtained by fractionated oxidation of a mixt. of Na and K obtained by the action of Na or KOH, KCl, etc. The $Na_2O_2$ prevents the $K_2O_4$ from becoming deliquescent.

**Metal chlorides and double chlorides thereof with sulfur.** Intermetal Corp. Brit. 363,622, Aug. 18, 1930. Metallic oxy compds. are chlorinated by a gaseous mixt. of Cl and $SCl_2$ contg. enough $SCl_2$ to reduce the oxy compd. and enough Cl to chlorinate it; alternatively there may be enough $SCl_2$ present to form a double chloride with the metal chloride. A mixt. of Ta and Ni oxides may be thus treated to remove the Ta by chlorination and volatilization. Other examples are cited.

**Phosphates.** Conway Baron von Girsewald, Hans Weidmann and Gerhard Roesner (to American Lurgi Corp.). U. S. 1,890,204, Dec. 6. A high-Si P-metal compd. such as ferro-P is treated (suitably by heating with $Fe_2O_3$) to remove Si until not more than 5% Si remains, and the material is then decompd. at elevated temp. with a salt contg. the metal of the desired phosphate, such as $Na_2SO_4$, and coal.

**Phosphates.** Norsk Hydro-Elektrisk Kvaelstof-Aktieselskab (Antonius Foss, Olaf Jensen and Odd H. Lunde, inventors). Fr. 738,210, June 6, 1932. Crude phosphates are treated with $HNO_3$, and $NH_4NO_3$ is added to the soln. obtained to ppt. a double nitrate of Ca and $NH_4$. $Fe(PO_4)_3H_6NH_3$ is also pptd. $NH_3$ is added to the remaining soln. to ppt. $CaHPO_4$ and $FePO_4$. $(NH_4)_2HPO_4$ and $NH_4NO_3$ are obtained from the filtrate. The double nitrate is dissolved by treatment with hot $HNO_3$ and so sepd. from the Fe.

**Dithiophosphates.** George Barsky and Ralph V. Heuser (to American Cyanamid Co.). U. S. 1,889,943, Dec. 6. In forming dithiophosphates such as aniline diisopropyldithiophosphate, an aliphatic monohydroxy alc. such as iso-Pr alc. or a phenol is reacted with $P_2S_5$ in the presence of an org. compds. such as toluene serving as a solvent for the starting material and for the dithiophosphate formed, and the latter is recovered (suitably by pptn. after adding aniline to complete the reactions).

**Sulfates such as aluminum sulfate.** Svend S. Svendsen (to Clay Reduction Co.). U. S. 1,889,710, Nov. 29. For sulfating the metallic oxide of a siliceous material such as clay contg. such oxide, the material is treated with $NH_4F$, Si diamminotetrafluoride is volatilized together with any water present, and the residue is heated with a reactive sulfate such as $H_2SO_4$ in a quantity not greater than required to sulfate completely the metallic oxide.

**Alumina.** Lonza Elektrizitatswerke und chemische Fabriken A.-G. Brit. 363,612, Aug. 18, 1931. See Swiss 150,910 (*C. A.* **26**, 4920).

**Alumina; alkali phosphates.** Chemische Werke vorm H. & E. Albert. Brit. 363,909, Mar. 22, 1930; Can. 322,066, May 3, 1932. See Ger. 516,460 (*C. A.* **26**, 3341).

**Barium hydroxide and polysulfides.** I. G. Farbenindustrie A.-G. Brit. 365,198, Oct. 21, 1929. The partial oxidation of Ba sulfide liquors with production of $Ba(OH)_2$ and Ba polysulfides is effected by air or other O-contg. gas at temps. exceeding 50°, *e. g.*, 90–95°. The hydroxide seps. out on cooling, and the mother liquors may be returned to the process, *e. g.*, they may be used to dissolve crude BaS and oxidation may be then effected at 60°.

**Barium hydroxide and polysulfides.** I. G. Farbenindustrie A.-G. Brit. 365,651, Oct. 25, 1930. Addn. to 365,198 (preceding abstr.). In a modification of the process of 365,198 a soln. of BaS is subjected to oxidation by air or gases rich in O in the presence of polysulfides or dissolved S at temps. not exceeding 50°. Increased pressure may be used. In examples $BaS_3$ or the filtrate from a prior operation is added to the soln. prior to oxidation with air or O.

**Barium oxide; calcium oxide.** Erik L. Rinman. Brit. 363,299, July 25, 1931. In the production of BaO from $BaCO_3$, fusion is prevented by admixing at least an equiv. quantity of $CaCO_3$ and preferably so much that the ratio of BaO to CaO is 1:1 by wt. and calcining the mixt. with a slow increase of temp. to 1400°.

**Molding and cooling calcium carbide.** George E. Cox (to American Cyanamid Co.). U. S. 1,889,951, Dec. 6. The molten carbide is poured into a receptacle to give a sufficient depth of carbide relative to cross section in the receptacle as to expose only a relatively small area to the air, and is allowed to solidify. App. is described.

**Double salts of calcium nitrate.** Emil Lüscher (to Lonza Elektrizitatswerke und chemische Fabriken A.-G.). U. S. 1,889,863, Dec. 6. The double salt $5Ca(NO_3)_2 \cdot NH_4NO_3 \cdot 10H_2O$ is obtained by adding 1.5–2.5 mols. of $NH_4NO_3$ per 5 mols. of $Ca(NO_3)_2$,

to a hot soln. of 70–82% $Ca(NO_3)_2$, permitting crystn. by slow cooling and sepg. the double salt from the still hot mother liquor. Similar double salts also may be prepd. contg. Ca nitrate together with nitrates such as $KNO_3$.

**Lime.** AKT.-GES. FÜR STICKSTOFFDÜNGER. Brit. 363,526, Jan. 19, 1931. See Fr. 709,565 (*C. A.* **26**, 1400).

**Magnesium carbonate.** ERNEST DUBOIS. Fr. 738,202, June 6, 1932. Dolomite or magnesite is calcined to MgO and $CO_2$ at a temp. below that necessary to decompose $CaCO_3$. An inert atm. other than $CO_2$ is used so as to lower the dissocn. temp. of the $MgCO_3$. The MgO is transformed to $Mg(HCO_3)_2$ by the action of $CO_2$ in aq. soln., and the $Mg(HCO_3)_2$ is heated to ppt. the hydrocarbonate with recovery of $CO_2$. An app. is described.

**Magnesium chloride.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,685, June 20, 1929. Void. Hydrated $MgCl_2$ is dehydrated by introducing it in the absence of Cl into an anhyd. saline melt contg. chlorides, *e. g.*, NaCl and KCl, the amt. added being such that the proportion of $MgCl_2$ is always less than in carnallite.

**Potassium carbonate.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,971, Aug. 20, 1930. See Fr. 721,227 (*C. A.* **26**, 4140).

**Silver, copper, lead and zinc sulfates and chlorides.** PAUL GAMICHON. Brit. 365,964, June 17, 1930. See Fr. 712,528–41–54 (*C. A.* **26**, 1566).

**Double compounds comprising trisodium phosphate.** FREDERIC C BOWMAN (to A. R. Maas Chemical Co.). U. S. 1,890,453, Dec. 13. A cryst. product comprises $Na_3PO_4$ together with salts of "monobasic" acids such as $NaNO_3$ and NaOH and $H_2O$ of crystn., and may be prepd. by crystn. from a composite aq. soln.

**Borax recovery from ores.** JOHN R. HUGHES (to Victor C. Emden). U. S. 1,889,989, Dec. 6. A comminuted mass of ore contg. Na borate and shale is calcined, this dehydrating and softening the Na borate and producing a more friable borax, and hardening and making less friable the shale; the material is subjected to soft grinding, this process reducing the borax in size and shape without like reduction of the shale, and the borax and shale are sepd. by screening. App. is described.

**Treating dolomite, etc.** DOLOMITE, INC. Brit. 363,871, Jan. 28, 1931. See U. S. 1,816,996 (*C. A.* **25**, 5522).

**Articles from basalt.** HAROLD L. WATSON (to The British Thomson-Houston Co., Ltd.). Brit. 363,291, June 16, 1930. Basalt is fused in a controlled reducing or oxidizing atm., cast into articles of desired shape, and then completely devitrified by a heat treatment fixed by the atm. used in the fusion.

**Supersaturated solutions of salts.** KARL HINTZMANN (to I. G. Farbenind. A. G.). U. S. 1,889,960, Dec. 6. Urea or a water-sol. urea deriv. such as thiourea is used as a solubilizing agent in prepg. aq. supersatd. solns. of salts such as $MgSO_4$ or the Na salt of butylnaphthalene sulfonic acid or the like.

**Hydrogen iodide.** PAUL E. WESTON (to Roessler & Hasslacher Chemical Co.). U. S. 1,890,874, Dec. 13. Reaction is effected between I and H at 150–200° and under pressures over 200 lb. per sq. in. in the presence of water and of chromic chloride which serves as a catalyst.

**Sulfur dioxide.** BOLGAR OIL PROCESSES, LTD., PHILIP A. MACKAY and WM. R ORMANDY. Brit. 364,103, July 16, 1930. $SO_2$ is recovered from mineral oils, tars, etc., that have been treated with $H_2SO_4$ by heating a mixt. of these with a heavy residual oil and passing the evolved gases which are given off in irregular manner to an equalizing device consisting of a storage vessel in which they are subjected to such pressure and held in such quantity that they can be drawn off regularly as required for the manuf. of $H_2SO_4$. App. is described.

**Barium.** ALLGEMEINE ELEKTRICITÄTS-GES. (to International General Electric Co., Inc.). Brit. 367,792, Aug. 20, 1929. Commercially pure Ba to be introduced into *elec. discharge tubes* is fused or heated to just below the m. p. for a considerable time in a current of rare gas and is then rapidly cooled to below 400° to distribute the remaining impurities evenly and thus avoid the usual rapid attack by air due to their distribution in layers.

**Active carbon.** AKTIENGESELLSCHAFT FÜR STICKSTOFFDÜNGER. Brit. 365,085, Nov. 6, 1930. C contained in the light ashes formed and carried into the flue during the combustion of brown coal (lignite), ordinary coal, wood or peat is activated by heating with alkali, etc., carbonates at 1000–1050° in the presence, if desired, of air, water vapor, O or inert gases. Alternatively the activation is effected by heating to 1000–1050° without the addn. of carbonates. After activation the product is worked up in known way.

**Carbon; hydrogen.** NATHAN GRÜNSTEIN. Brit. 363,735, Oct. 3, 1929. See Fr. 704,601 (*C. A.* **25**, 4671).

**Lampblack from liquid hydrocarbon material.** JACQUE C. MORRELL and VALENTINE A. MEKLER (to Universal Oil Products Co.). U. S. 1,890,188, Dec. 6. Incomplete

combustion of liquid hydrocarbon material is effected, while it is continuously flowing by gravity in a thin film (in a described app.).

**Hydrogen.** GESELLSCHAFT FÜR KOHLENTECHNIK. Brit. 365,111, July 16, 1929. Void. A mixt. of $CO_2$ and H is produced in the production of a non-poisonous town gas by passing the original gas with water vapor at high temp. over a catalyst, such as calcined dolomite, which absorbs the $CO_2$ as it is formed. Org. S compds. are also partly removed by conversion into $H_2S$ which is partly absorbed by the dolomite.

**Hydrogen.** GESELLSCHAFT FÜR KOHLENTECHNIK. Brit. 365,582, July 20, 1929. Void. Addn. to 365,111 (preceding abstr.). The process of 365,111 is operated so that during the whole or a portion thereof the temp. is such that there is a definite predetd. vapor pressure of $CO_2$ above the absorbing material. The process may be carried out in 2 stages in the first of which $CO_2$ is completely, in the second incompletely, absorbed.

**Hydrogen.** HARUTYUN G. TERZIAN (to Humphreys & Glasgow, Ltd.). Brit. 365,912, Apr. 30, 1930. In producing gases rich in H by cracking hydrocarbon gases in an ignited fuel bed, the temp. of the bed is about 1200°, so that the decompn. of $CH_4$ is a surface effect. The temp. is regulated by steaming the bed, some blue water gas being formed, and mixing with the "broken-down gas" to give a reformed gas contg. up to 90% H. Cf. *C. A.* **26**, 4141.

**Hydrogen from steam and gaseous hydrocarbons.** JOHN S. BEEKLEY (to E. I. duPont de Nemours & Co.). U. S. 1,889,530, Nov. 29. Interaction of steam and hydrocarbons such as $CH_4$ is effected in a succession of sep. catalytic reaction stages, and the space velocity in each stage is substantially proportional to the reaction rate in that stage. Cf. *C. A.* **26**, 4424-5.

**Hydrogen from steam and carbon monoxide.** ALFRED T. LARSON (to E. I. du Pont de Nemours & Co.). U. S. 1,889,672, Nov. 29. A catalyst contg. Cu and an oxide of one of the elements W, Mo, Ce, V, Mn or Mg is used at an appropriately elevated temp.

**Liberating nascent hydrogen in aqueous media.** OLIVER M. URBAIN (to Charles H. Lewis). U. S. 1,889,714, Nov. 29. An aq. medium such as a dye soln. or soln. used in a metallurgical process is conjointly treated with a positively charged colloid such as hydrous Al oxide and an electrolyte in the form of an alkali metal salt such as $Na_2SO_4$ which releases anions for adsorption by the colloids and cations for reaction with the water of the soln.

**Phosphorus.** VICTOR CHEMICAL WORKS. Fr. 738,265, June 7, 1932. Briquets contg. phosphate ores and a carbonaceous material in amt. below that necessary to reduce the P compds. are heated in a furnace. The amt. of reducing material is preferably 25–75% of that theoretically necessary and may contain volatile hydrocarbon constituents. A siliceous material may also be added.

**Sulfur and ammonium sulfate from gases containing hydrogen sulfide.** HANS BAUER (to I. G. Farbenind. A.-G.). U. S. 1,889,942, Dec. 6 See Ger 545,627 (*C. A.* 26, 3630).

**Sulfur.** GEWERKSCHAFT MATHIAS STINNES Brit. 366,052, Sept. 2, 1929. Void. See Fr. 699,839 (*C. A.* **25**, 3447).

**Sulfur.** IMPERIAL CHEMICAL INDUSTRIES, LTD Fr. 737,664, May 26, 1932. S is obtained free from As by digesting it with a soln. of $NH_3$, $(NH_4)_2S$ or $(NH_4)_2CO_3$, preferably under pressure at 120–130°. An app. is described in which the S passes in countercurrent to the soln.

**Catalysts.** I. G. FARBENIND. A.-G. Fr. 738,349, June 9, 1932. Durable and very active catalysts for hydrogenation, dehydrogenation, reduction, splitting, etc., are made by treating catalytic substances, before their use, during more than 5 hrs., preferably 10 hrs or more, at a slowly increasing temp. or modified by degrees, by H and by vapors or gases of C compds. C compds. include cyclohexene, cyclohexane, *m*-cresol, $C_6H_6$, gasoline, CO, $CH_4$ and its homologs, thiophene, $PhNH_2$, pyridine and aminophenols.

**Catalyst.** G. SIEBERT G. M. B. H. Fr. 738,479, June 10, 1932. Re or alloys thereof with Pt, Ir, Rh, Ag or other metal is used as a catalyst, *e. g.*, in the oxidation of $NH_3$. Cf *C. A.* **26**, 506.

**Catalytic agents.** HOWARDS & SONS, LTD , JOHN W. BLAGDEN and GEO. C. H. CLARK. Brit. 363,776, Nov. 6, 1930. Dehydrogenation catalysts consisting of known mixts. of metallic oxides are prepd. by soaking a suitable carrier, *e. g.*, pumice, in a soln. of a mixt. of salts, *e. g.*, Cu and Mg nitrates, that are decomposed below 500° and then heating to the decompn. temp. to drive off acid radicals and leave the oxides.

**Catalytic agents.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,214, Oct. 24, 1930. Hydrogenation catalysts for the production of amines by treatment of carbonyl compds. with $NH_3$ or amines in the presence of H comprise finely divided metals of the 8th periodic group activated by the addn. of metallic oxides, or compds. furnishing oxides, *e. g.*, CoO, $ZnCO_3$, $(NH_4)_2CrO_4$, or substances with a weakly acid reaction, *e. g.*, $SiO_2$, or alk. reaction, *e. g.*, CaO, $AlPO_4$. Among examples $NiCO_3$ is soaked with chromic acid

soln. and reduced with H; Ni and Co hydrates are pptd. from a soln. of Ni and Co nitrates contg. kieselguhr and then reduced.

**Catalytic apparatus for the decomposition of ammonia into its elements.** Du Pont Ammonia Corp. Brit 363,300, Aug. 1, 1930.

**Condensation products from formaldehyde, urea and thiourea.** Alphonse Gams, Gustave Widmer and Karl Frey (to Soc. pour l'ind. chim. à Bâle). U. S. 1,890,033, Dec. 6. Clear condensation products are obtained by condensing $CH_2O$ with a quantity of urea not greater than 1 mol. proportion of urea per each 2 mols. of $CH_2O$, at a temp. of about 100°, up to a stage at which a sample of the reaction mixt. yields a ppt. on dilu. with water, then neutralizing (suitably with dil. NaOH) and adding thiourea in such proportion that the total quantity of urea and thiourea present in the mixt. is not less than 1 mol. proportion per each 1.6 mol. proportions of $CH_2O$, and allowing the resulting soln., before being further worked up, to stand until at least the greater part of the free aldehyde has been bound. Cf. *C. A.* **26**, 815.

**Urea- and thiourea-aldehyde condensation products.** Pfenning-Schumacher-Werke G. m. b. H. Brit 364,069, June 21, 1929. Void Thiocyanates of metals are added to molding compns. comprising urea-aldehyde condensation products whereby polymerization in the hot-press is promoted and the moldings improved.

**Urea- and thiourea-thiocyanate-aldehyde condensation products.** Pfenning-Schumacher-Werke G. m. b. H. Brit. 364,068, June 21, 1929. Void Artificial masses for molding are made by incorporating a condensation product of a metallic thiocyanate and $CH_2O$ with a urea-aldehyde condensation product. Among examples urea, $Al(CNS)_3$ and $CH_2O$ are heated together and alkali added, a mucilaginous ppt being formed; and thiourea, $Ca(SCN)_2$ and $CH_2O$ are heated together, the soln. evapd. and a yellow resin pptd. by the addn. of acid salts.

**Phenol-aldehyde condensation products.** John J. Kissler (to Apple Electrical Mfg. Co.). U. S. 1,889,751, Dec. 6. A molding compn. is formed by incorporating an inert filler such as wood flour or asbestos with a potentially reactive resinous binder prepd. by partial reaction between an aldehyde and a mixt. of monohydric phenols and polyhydric phenols.

**Molded objects.** Soc. pour l'Ind. chim. à Bâle. Fr. 737,654, May 26, 1932. Condensation products from carbamides and aldehydes are converted by heat and pressure to sheets incompletely hardened, which are afterwards combined among themselves or with other substances to form molded products, using higher temps. and pressure, so that they are completely hardened.

**Plastic compositions.** Elektrochemische Werke Munchen A. G. Brit 363,682, April 26, 1929. Void In producing plastic compns. the plasticizing agents are added in the form of aq. dispersions.

**Plastic composition suitable for buttons, etc.** Victor Scholz (one half to Atla Ago Chemische Fabrik A.-G.). U. S. 1,889,702, Nov. 29. A mixt. contg. a binder free of solvents and a swelling of nitrocellulose in a volatile solvent such as EtOAc, is stirred until the mixt. assumes a homogeneous viscous liquid state. It may be molded under pressure.

**Plastic products.** Joseph C. Patrick. U. S. 1,890,191, Dec. 6. Products, which are of different rubberlike characters, are formed by reaction between an alk. polysulfide such as $Na_2S_4$ or $CaS_4$ and olefinic compds. such as $C_2H_2Cl_2$ or mixed Cl derivs. of olefins in cracked petroleum gases. Cf. *C. A.* **26**, 3344.

**Filling shoe bottoms with plastic material.** Andrew Thoma (to North American Chemical Co.). U. S. 1,890,473, Dec. 13. A plastic filler material is introduced into a shoe bottom cavity substantially simultaneously with a sep. chemical stiffener such as an acid coagulant for an alk. dispersion. Cf. *C. A.* **27**, 820.

**Plasticizer.** C. F. Boehringer & Soehne G. m. b. H. Brit. 364,807, June 24, 1930. A plasticizer used in the production of plastic masses, films, lacquers, etc., from cellulose esters or ethers is an ether of glycerol, etherified by one or more mols. of glycerol or a glycol, and esterified in at least one OH group by a monocarboxylic acid or acids excluding those contg. more than one type of reactive group, *e. g.*, salicylic or benzoyl benzoic acid. Examples are diglycerol tetraacetate, triglycerol triacetate.

**Porous masses and objects.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Brit. 363,058, Oct. 28, 1930. Porous masses are produced by incorporating substances contg. active O, *e. g.*, $H_2O_2$, alkali peroxides, etc., in substances capable of binding, *e. g.*, cement, calcined gypsum, etc., and controlling the development of the O during the binding process by substances effecting or promoting the generation of gas, *e. g.*, $MnO_2$, org. catalases, etc. Substances stabilizing the gas bubbles, *e. g.*, soap solns., saponin, etc., may be added.

**Porous masses and objects.** Deutsche Gold- und Silber-Scheideanstalt vormals Roessler. Brit. 363,192, Jan. 27, 1931. Addn. to 363,058 (cf. preceding

abstr.) Porous masses are made by adding to non-setting substances, *e. g.*, kaolin, ır, etc., water and compds. contg. active O, and generating O, *e. g.*, by decom- ıtalysts, while influencing the size, no. and distribution of the gas bubbles, prefer- ably by the presence of substances such as soaps, saponin, glue, etc.; whereupon the masses formed are solidified, *e. g.*, by drying and burning. The products are used for the absorption of liquids, *e. g.*, acids, low-boiling poisonous substances such as HCN and ethylene oxide for destroying vermin, and for heat insulators, catalyst carriers, filters, diaphragms, etc.

**Adhesives.** ALCHANAN COHEN Brit. 363,710, Sept. 19, 1930. A thin paper is coated on both sides with material with adhesive properties developing on heating or moistening. Thus it may be coated with a soln. of shellac in MeOH, dried and again coated with an aq. soln. of glue contg glacial AcOH and Cr alum.

**Adhesives.** CLAUDE ROY. Brit. 364,968, April 18, 1930. Casein glues are made by adding to powd casein a "pos." alk product, *i. e.*, one having a strong solvent action on casein, *e. g.*, CaO, alk. chlorates, carbonates and fluorides, and a "neg." alk product, *i. e.*, one which does not disturb the soln. of casein in the "pos." product and moreover neutralizes the discoloring action of the latter by preventing pptn of tannin, etc., in glued wood, *e. g.*, alk borates, fluosilicates and alum. A drying agent, *e. g.*, anhydr. titanic acid, which also acts as a "neg." product may be added. For an example cf. Fr. 709,478 (*C. A.* **26**, 1405).

**Adhesives, coating and binding agents.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,348, Aug. 7, 1930. Viscous to solid products are produced by warming butadiene under pressure in the presence of a substantial quantity of O but in the absence of water and of hydrazine derivs. An org. solvent capable of dissolving the polymerization product may be added, *e. g.*, $C_6H_6$, benzine, cyclohexane.

**Adhesive films.** WILLY STEIKENS (to Worbla A. G.). Brit. 364,765, Dec. 3, 1929. Adhesives in the form of dry films having a basis of cellulose derivs. are provided with transverse paths through the thickness thereof for the solvents and swelling agents used in softening them. Among examples is a film of nitrocellulose contg. Zn white which is subsequently dissolved out by dil. AcOH.

**Composition backing for brushes.** ARTHUR F. LINDEWALL. U. S. 1,889,675, Nov. 29. A back of powd. pumice bound with Na silicate is provided with a cavity in which a non-expansible brush back is secured which carries the brush bristles.

**Rendering casein insoluble.** FERNAND F. SCHWARTZ. Fr. 737,578, Sept. 19, 1931. A metal complex is incorporated with a soln. of casein in aq. $NH_3$. On removal of the volatile substances a metallic phospho-proteinate is obtained which is completely insol. in water. The process is used in making *glues, waterproof coatings, paints, varnishes*, etc. The metal complex is prepd. by treating a metal salt, *e. g.*, $Ni_2(SO_4)_3$, with NaOH, to ppt. the hydroxide which is washed and redissolved in aq. $NH_3$. This soln. is added to the soln. of casein.

**Artificial horn.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 738,156, June 4, 1932. A mixt. of casein with less than half its wt. of a resol or like condensation product, *e. g.*, a condensation product of diphenylolpropane and $CH_2O$ is molded to make artificial horn.

**Wetting, etc., agents.** I. G. FARBENINDUSTRIE A. G. Brit. 364,104, July 28, 1930. Wetting, cleansing, dispersing and emulsifying agents are prepd. by condensing ethers obtained from alkylol amines and of the formula, $NR'R''R'''$ (where R' represents the group Alkyl—O—Alkyl—OH, in which case R'' and R''' represent H, alkyl, cycloalkyl, aryl, alkylol or Alkyl—N—(Alkyl—OH)$_2$, or either R'' or R''' represent Alkyl—O—Alkyl—OH, or both R'' and R''' belong to the same heterocyclic ring formed by the N atom, or R' and R'' represent Alkyl—O—Alkyl—, in which case R''' is H, alkylol or —Alkyl—O—Alkyl—OH, or R' represents —Alkyl—O—Alkyl—NR''—R''' (R'' and R''' in this case being H) with carboxylic acids contg. at least 8 C atoms, or with their anhydrides, halides or esters. The acids may also contain sulfonic or sulfuric ester groups. The products are esters or amides or mixts. Among examples olive oil is heated with tetrahydroxyethylethylenediamine monohydroxyethyl ether.

**Wetting, etc., agents.** I. G. FARBENINDUSTRIE A. G. Brit. 364,107, Aug. 26, 1930. Sulfonated products which are wetting, cleansing and emulsifying agents are prepd. by sulfonating an ester of a higher aliphatic or cycloaliphatic carboxylic acid contg. at least 7 C atoms in the mol. and having at least one free OH group in the alc. residue, or mixts. of such esters. Among examples glycolmonoricinoleic ester is sulfonated with $H_2SO_4$ and naphthalene is sulfonated and condensed with glycerolmonolauric ester.

**Wetting, etc., agents.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,537, Sept. 22, 1930. Alkylated aromatic hydrocarbons and their derivs. are made by condensing aro-

matic hydrocarbons or their derivs., *e. g.*, halogen, hydroxy or amino compds. or sulfonic acids thereof, with aliphatic alcs. or mixts. thereof or their esters, and sulfonating if necessary. Solvents may be advantageously used with higher alcs. The hydrocarbon may be first sulfonated and then alkylated, or the alkylated hydrocarbon may be sulfonated, or the alkylation and sulfonation may be carried out simultaneously. Catalysts may be used, *e. g.*, $PCl_3$, AcCl, etc., with or without $P_2O_5$. The products are more efficient wetting agents than the corresponding mono- and dialkylated products. Among examples naphthalene-β-sulfonic acid is treated with isopropyl alc. and concd. $H_2SO_4$ to form multipropylated-β-naphthalene sulfonic acid.

**Wetting, etc., agents.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,669, Oct. 6, 1930. *Assistants for the textile, leather, paper,* etc., *industries* are obtained by sulfonating olefins, free from carboxy groups, produced by splitting off $H_2O$ and (or) $CO_2$ from the products of the destructive oxidation of difficultly volatile liquid or solid non-aromatic hydrocarbons, contg. at least 8 C atoms, with energetic sulfonating agents, *e. g.*, oleum, chlorosulfonic acid, liquid $SO_3$, at above 100° or in the presence of dehydrating agents, whereby true sulfonic acids are formed. The products are wetting, cleansing, dispersing and emulsifying agents. Among examples chlorosulfonic acid is used to sulfonate olefins prepd. by the distn. of the oxidized products, insol. in petroleum ether, of a hard paraffin wax.

**Wetting, etc., agents.** CHEMISCHE FABRIK VORM. SANDOZ. Brit. 364,844, Jan. 15, 1930. The wetting properties of alkali solns. used for the treatment of natural and artificial cellulosic fibers are increased by adding a mixt. of phenols with *N*-contg. org. bases. In examples com cresols mixed with $PhNH_2$, triethanolamine, phenyltrimethyl ammoniummethyl sulfate and pyridine are used.

**Wetting, etc., agents.** CHEMISCHE FABRIK VORM. SANDOZ. Brit. 365,323, Jan. 16, 1930. The wetting properties of alkali solns. of mercerizing strength are improved by adding a mixt. of phenols with ketones not contg. OH groups. In examples mixts. of com. tar cresols with camphor and with acetone oil are added to NaOH lyes.

**Wetting, dispersing, cleansing, etc., agents.** I. G. FARBENIND. A.-G. Fr. 738,057, June 2, 1932. Wetting, etc., agents are made by introducing halogen into aliphatic esters or amides of high mol. wt. which contain sulfonic groups, or by prepg. such compds. from substances contg. at least one halogen atom.

**Detergent; shampoo; sheep dip.** EUGENE V. HAYES-GRATZE. Brit. 363,657, Sept. 12, 1930. A detergent, shampoo or sheep dip is made by submitting a neutralized sulfonated oil, prepd. from olive, castor, etc., oils, to ionization treatment, *e. g.*, electrolysis or high-tension or high-frequency discharge, whereby the $p_H$ of the oil is increased to 7.5 or 8, and then dilg. with 5–20 vols. of $H_2O$.

**Solid stable composition for bleaching.** RICHARD FREIBELMANN (to Chemische Fabrik von Heyden, A.-G.). U. S. 1,890,603, Dec. 13. A dry mixt. of a dichloride of an aromatic sulfonamide such as *p*-toluenesulfodichloramide and a water-sol. salt of alk. reaction such as $Na_2CO_3$ is suitable for treatment with water to obtain a bleaching soln. contg. hypochlorite.

**Emulsifying agents.** IMPERIAL CHEMICAL INDUSTRIES, LTD., and RICHARD P. MCGLYNN. Brit. 365,299, Jan. 5, 1931. Sulfonated fatty-aromatic compds. suitable as emulsifying agents, *e. g.*, for fats and oils or mineral oils, are prepd. by treating a mixt. of a hydroxy fatty oil and a phenol or naphthol first with strong $H_2SO_4$ and then with oleum. In examples mixts. of castor oil with PhOH, β-naphthol and com. cresylic acid are thus sulfonated.

**Colloidal dispersions.** ELEKTROCHEMISCHE WERKE MÜNCHEN A.-G. Brit. 363,681, Apr. 14, 1930. Void. Colloidal dispersions of solid or liquid substances are prepd. with the use, as the dispersion medium, of a dispersion of a solvent for the substance to be dispersed. Thus rubber is dissolved in $C_6H_6$, and the soln. is dispersed in an aq. soln. of $C_6H_6$, preferably contg. an oleate or other emulsifying agent.

**Coating compositions.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,676, June 18, 1929. Void. Lined and coated foils for cigaret tips consist of a base of tissue paper having a coating contg. a pigment, whose binding agent consists chiefly of a condensation product of polyvinyl acetate.

**Water-soluble composition for cleaning aluminum.** HARRY V. CHURCHILL (to Aluminum Co. of Am.). U. S. 1,890,214, Dec. 6. Tartaric acid or a similar acid is used with an admixt. of about 1% of an alkali metal fluoride.

**Composition for use in glazing, calking and pointing.** THOMAS C. PARR. U. S. 1,889,842, Dec. 6. A pigment such as whiting and asbestine about 30, asbestos fiber about 5 and Al 9 are mixed with an oil such as linseed or soy-bean oil about 30%, the balance of the compn. being a volatile diluent vehicle such as "mineral spirits." Varnish, etc., may also be used.

**Friction materials.** H. WHITWORTH (to Colt's Patent Fire Arms Mfg. Co.). Brit. 380,310, Dec. 19, 1930. Method of making friction material for brake linings is described.

**Treatment of marine algae.** COMPAGNIE FRANÇAISE DE L'IODE ET DE L'ALGINE. Brit. 363,353, Sept. 6, 1929. See Fr. 696,778 (*C. A.* **25**, 2824).

**Fibrous sheet material including leather and other fibrous admixture.** GEORGE F. DAVIS. U. S. 1,889,643, Nov. 29. Cellulose fiber is beaten in water until well hydrated; the resulting fiber in aq. suspension is sized and then mixed with previously tanned leather fiber while substantially all of the water-sol. constituents of the latter (including tanning agent) are kept with it. The product may be formed into felted sheets for shoe counterboards, etc.

**Board-like material from mineral wool.** ISIDOR KITSEE (to Mineralite Corp.). U. S. 1,890,184, Dec. 6. Various details of manuf. are given of a material which may be treated with Na silicate or the like to produce a smooth surface on both sides.

**Sheet packing and molded packings.** COMPAGNIE GÉNÉRALE D'ÉLECTRICITÉ. Brit. 363,425, Sept. 28, 1929. Mineral fibers in aq. dispersion are admixed with aq. dispersions of a plastic binding material, *e. g.*, rubber, so that, after filtering, the consolidated material contains at least 20% mineral fibers and 5% binding material and is of such consistency that the waste from stamping or cutting can be mixed with the original unfiltered material for reuse.

**Impregnated sheet materials for oil paintings.** BAKELITE CORP. Brit. 357,204, May 20, 1930. Sheet material such as paper or cloth is impregnated with a phenol-formaldehyde or other artificial resin in liquid state which is subsequently converted into the insol. state by heat. A plurality of layers of impregnated material may be superposed and united by heat and pressure, and the working surface may be roughened in molding or by grinding or sand-papering or the like.

**Magnetic cores.** ARAM BOYAJIAN (to The British Thomson-Houston Co., Ltd.). Brit. 363,606, May 21, 1930. A laminated magnetic core has a joint in its magnetic circuit filled with a magnetic cement comprising a large proportion of powd. Fe and a little portland cement.

**Core or mold binder, coating or paste.** CHARLES M. SAEGER, JR. U. S. 1,889,905, Dec. 6. Rubber is used with a polymerized vinyl deriv.

**Projection screen.** FRANK H. RICHARDSON and JAY C. KROESEN. U. S. 1,890,828, Dec. 13. Screens are formed by carbonate-coated paper strips joined at their adjacent edges by overlapping skived portions to form a substantially invisible seam.

**Projection screens.** E. BASSO. Brit. 344,475, Nov. 19, 1928. Monochromatic images are projected onto a screen which, for showing images in colors, carries a uniform mixt. of fine particles of transparent material (such as glass or celluloid) separately colored in red, green and blue, or in other complementary colors, applied to a black background.

**Sound-permeable projecting screen.** W. C. BAILEY and J KEEFE. Brit. 345,487, March 17, 1930. Various structural details are described involving a screen which may be formed of wire gauze or other open-mesh material coated with white, silver or Al paint with the interstices not entirely filled, and a similar closely spaced screen the interstices of which are in staggered relation to those of the first screen.

**Sizing preparations.** AUGUSTE F. GALVIN. Fr. 737,584, Sept. 21, 1931. Sizing baths very concd. in the sizing product are used and at a temp. above 35° and sometimes up to 80°.

**Artificial snow.** JOHN OFTEDAHL. U. S. 1,890,127, Dec. 6. A self-supporting slab of sol. silicate is prepd. with a fragmentary light-reflecting surface.

**Manufacture and use of decalcomania transfers.** PRESTON W. MARSHBURN (to Northam Warren Corp.). U. S. 1,889,484, Nov. 29. Various details of mech. character are described.

**Dental-impression wax composition.** ANGELO C. ANTONUCCI. U. S. 1,889,622, Nov 29. Shellac about 45, a filler such as talc or French chalk about 30, coloring material, and a polyhydric alc. such as glycerol about 2.5% are used together, the remainder of the compn. including mixed fatty and resin acids such as palm oil or tallow fatty acids, shellac, etc.

**Hydrocyanic acid fumigation.** KENNETH F. COOPER (to American Cyanamid Co.). U. S. 1,889,950, Dec. 6. A mass contg. $Ca(CN)_2$ and S is exposed to the air to cause liberation of HCN in toxic concn. (the S remaining in the residue partly as $Ca(CNS)_2$).

# 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

**Range of the softening of glass and its definition.** K. V. STRUVE. *Keram. i Steklo* **8,** No. 10, 31–2(1932).—Methods used for detg. the range of the softening of glass and some investigations made at the Lenzos works on this question are discussed.
M. V. KONDOIDY

**Effect of temperature on metals used in the glass industry.** CLYDE E. WILLIAMS. *Ceramic Ind.* **18,** 225–7(1932).—A discussion of special metals required for melting, annealing and mold operations, *e. g.*, Ni-Cu-Cr, Ni-Cr, Cr-Ni-C, alloys and Cr-plated cast irons. Cr plating prolongs the life of cast-iron molds, also steel rolls for lehrs.
ELTON E. LENT

**Eternal problem of seed [in glass].** F. W. NOEL. *Glass Ind.* **14,** 1–3(1933).—Batching and melting factors producing seeds are discussed, and also the action of the usual fluxing and fining agents. H. F. KRIEGE

**Soldering glass tubes.** M. A. BESBORODOV. *Keram. i Steklo* **8,** No. 10, 33–5 (1932).—A no. of glass tubes having different coeffs. of expansion were soldered together. The strength of the soldering was detd. by investigating the thermal resistance of the soldered glass tubes. All the soldered glasses were annealed and observed in a polarizing app. No stresses were seen and there was no regularity in the relation between the difference of the coeffs. of expansion and the strength of the soldering. Soldering is not a function of the coeffs. of expansion only (for low temps.) of soldered glasses.
M. V. KONDOIDY

**Egyptian glass.** L. M. ANGUS-BUTTERWORTH. *Glass Ind.* **14,** 21, 23–4(1933).
H. F. K.

**Testing safety glass.** M. NICOLARDOT. *Glaces et verres* **5,** No. 25, 4–6(1932); *Keram. i Steklo* **8,** No. 10, 40.—Tests were made on (1) the transparency of "triplex" glass; (2) action of light on the change in color of the elastic intermediate layer, (3) action of sudden temp. change; (4) action of long heating; (5) effect of repeated shaking. The results are tabulated. Lack of change of color after long exposure to ultra violet rays is due to the fact that cellulose has been replaced by acetate of cellulose.
M. V. KONDOIDY

**Cementing material of sand-lime bricks. An x-ray and microscopical investigation.** GEOFFREY GRIME AND GEO. E. BESSEY. *Trans. Ceram. Soc.* **32,** 14–21(1933).—The examn. shows that the cementing material in sand lime bricks consists of an amorphous hydrated Ca silicate which may be converted in part or wholly to $CaCO_3$ and hydrated $SiO_2$ by exposure to $CO_2$. The min. crystals observed in com. brick are calcite. In lab. specimens 90% of the CaO present was found combined as a silicate when $CO_2$ was absent. H. F. KRIEGE

**The drying of solids. V. Mechanism of drying of clays.** T. K. SHERWOOD AND E. W. COMINGS. *Ind. Eng. Chem.* **25,** 311–16(1933); cf. *C. A.* **26,** 2255.—See *C. A.* **27,** 388.
G. G.

**Effect of electrolytes on clay slips.** F. L. CLARK. *Trans. Ceram. Soc.* **32,** 1–6 (1933).—Further exptl. evidence supports Whitlatch's explanation (*C. A.* **25,** 1349) of the action of Na silicate on the deflocculation and viscosity of clay slips. The behavior of adhesion tension between water and clay is discussed. H. F. KRIEGE

Testing ampoule glasses (V. KLOBUSITZKY) **17.** A new cement kiln refractory (SONNTAG) **20.** Experiences with $SiO_2$ in a continuous vertical plant (TERNES) **21.** Kaolin (SCHWARZ, TRAGESER) **8.** Cellulose ester compositions [for laminated glass] (Brit. pat. 363,689) **23.** Sifting apparatus for potters' slip, etc. (Brit. pat. 367,047) **1.**

ZSCHIMMER, EBERHARD: **Das System Kieselerde, Quarzgut und Quarzglas, Silikasteine.** Stuttgart: F. Enke. About 145 pp. About M. 13.

MÜLLENSIEFEN, WERNER: **Über den Einfluss der Tonerde auf die Entglasungskonstanten der Natron-Silikat-Gläser.** Thesis, Karlsruhe, 1931. 30 pp.

PETERSEN, KURT: **Die geschichtliche Entwicklung der Glasindustrie im Rheinland.** Thesis, Cologne, 1930. 103 pp.

WENTZ, BENNO: **Die Herstellung von Tridymitsteinen.** Thesis, Aachen, 1930. 29 pp.

**Glass-melting furnaces.** W. RÖSSLER. Brit. 381,582, June 29, 1931.

**Rotary tank furnace for melting glass.** WALTER O. AMSLER (to Hartford-Empire

Co.). U. S. 1,889,509, Nov. 29. Glass batch material is fed continuously into one end of a rotary container in which it is melted, and the melted glass is kneaded in the container by the rotation of the latter about a substantially horizontal axis while molten glass is continuously delivered from the other end of the container. Claim is made generally to this mode of operation. U. S. 1,889,510 also relates to structural details of a glass-melting tank and assocd. batch-feeding app. U. S. 1,889,511 relates to a rotary glass-melting furnace.

**Forehearth for glass furnaces.** JOTHAM F. BLACK (to Hartford-Empire Co.). U S. 1,890,174, Dec. 6.

**Electrode for use in melting glass.** HAROLD W. MCINTOSH (to Hartford-Empire Co.). U. S. 1,889,516, Nov. 29. Various details are described of an electrode adapted to be immersed in the melting glass material. Cf. *C. A.* **27**, 579.

**Machines for working glass in the form of a ribbon shaped between rolls.** DONALD W. STRAIT (to Corning Glass Works). Brit. 363,276, June 12, 1930

**Rolling machine for glass.** N. V. MAATSCHAPPIJ TOT BEHEER EN EXPLOITATIE VAN OCTROOIEN. Fr. 738,112, June 3, 1932

**Apparatus for rolling complex bands of glass.** PILKINGTON BROS., LTD Fr. 738,231, June 6, 1932

**Solid rods and tubes of glass, etc.** COMPAGNIE DES LAMPES. Brit. 363,267, May 22, 1930. Rotation is imparted to the glass, etc, while being drawn, by means of a difference of temp produced on 2 opposite sides of the rod or tube when it issues from the drawing plate.

**Apparatus for making glass tubing and rods.** PIERRE A. FAVRE U. S. 1,889,891, Dec 6. Structural details.

**Apparatus and method for the mechanical production of compounds of flashed sheet glass.** BERNHARD ENGELS. Brit. 363,385, Sept. 23, 1929.

**Apparatus for plate-glass manufacture.** JOHN H. FOX (to Pittsburgh Plate Glass Co). U. S. 1,890,322, Dec. 6. Various structural and mech. features are described.

**Protective coatings on metallic reflecting surfaces of glass mirrors, etc.** WM. PEACOCK, JR. (to Peacock Laboratories, Inc). U. S. 1,890,094, Dec. 6. There is applied to the rear surface of a mirror or the like a freely flowing mixt. of a resinous material such as an alc. shellac soln and comminuted Cu particles of substantially leafy form.

**Safety glass.** I. G FARBENINDUSTRIE A.-G. Brit. 363,933, April 19, 1930. A reaction product of maleic anhydride, or a dibasic acid yielding it, with an org substance contg OH, such as mono-alcs having a double bond in the 2,3-position, *e. g.*, allyl alc., castor oil, or 1,3-dialcs., *e. g.*, 1,3-butylene glycol, is used in the manuf. of compd. glass. In an example the use of a product obtained by heating to 120° equimol proportions of maleic anhydride and castor oil, admixed or not with a product obtained by heating equimol proportions of maleic anhydride and butylene glycol to 150°, is described.

**Safety glass.** C. F. BOEHRINGER & SOEHNE G. M. B. H. Fr. 737,804, May 30, 1932. Cellulose esters, particularly the acetate, are brought into sheet form by plastification by means of glycerol ethers, esterified in at least one OH group, *e. g.*, diglycerol tetraacetate. The sheets are used for uniting 2 sheets of glass.

**Press for uniting sheets of safety glass.** ADOLF KAMPFER and ADOLF C. PLÖTZE. Fr. 737,827, May 30, 1932.

**Silica bricks.** MAX HOLLENWEGER. Fr. 738,241, June 7, 1932. Large-grained quartz or the like is mixed with finely divided quartz (passing a sieve of 10,000 holes per sq cm) and lime and(or) clay, a mixt in which the proportions of $SiO_2$, clay and(or) lime are regulated so that the agglutinating mass fuses at the temp. of baking the bricks. The mixt. is molded and baked

**Ceramic compositions.** WALTER BLOCH. Fr. 738,222, June 6, 1932. Compns. having a high d after baking are made from refractory substances such as refractory clays, oxides, silicates, nitrides, carbides, etc. These are fritted and baked in the dense state at a low temp. by means of a mixt. of clay and talc which forms a eutectic mixt.

**Heat treatment of ceramic, etc., ware in tunnel kilns or furnaces.** HARROP CERAMIC SERVICE CO. Brit. 363,305, April 10, 1930. App. is described.

**Yellow glazed earthenware.** HARRY J. MCMASTER (one-fourth each to Sebring Pottery Co., Limoges China Co., Crescent China Co., and Salem China Co.). U. S 1,890,297, Dec. 6 Na uranate is calcined with china clay and flint and the product is added to a transparent white glaze compn in such proportion that the quantity of the U salt in the resulting mixt. is 1-3% of the total mass; unglazed dishes are dipped into the mixt. and then fired in a non-reducing atm.

**Rings and other hollow bodies of fused quartz.** DEUTSCHE-ENGLISCHE QUARZ-SCHMELZE G. M. B. H. Brit. 363,610, Sept. 10, 1930. Ring segments made in known ways are embedded in quartz sand, the places of contact being welded with the surrounding sand and with one another by uniform heating.

**Artificial masses.** I. G. FARBENIND. A.-G. Fr. 737,829, May 30, 1932. Masses resembling porcelain are made by mixing chlorinated naphthalene of waxy consistency with finely divided solids, such as talc, CaO, $SiO_2$, Al or charcoal.

**Refractory bricks.** GENERAL REFRACTORIES Co. Brit. 364,131, July 2, 1930. See Fr. 699,598 (*C. A.* **25**, 3455).

**Molding refractory objects.** CORNING GLASS WORKS. Fr. 738,115, June 3, 1932. The mold is partially filled with a core of solidified refractory material, the remaining space being filled by a single stream of molten refractory material. Fr. 738,116. In the mold is placed a refractory support, a large part of the surface of which constitutes a wall of the hollow of the mold and sufficient molten refractory material is introduced to melt this support. Fr. 738,117. Pieces of calcine and fused material are introduced into the mold and have sufficient d. to sink in the molten material.

**Refractories in metallurgy; furnace walls; melting pots.** O. KRÖGER and O. OSWALD. Brit. 380,290, Sept. 4, 1931.

**Heat-treating furnace suitable for burning enamel ware.** CHAUNCEY A. DUTTON (to Ferro Enamel Corp.). U. S. 1,889,955, Dec. 6.

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

**Standard cement test samples. Preparation of stabilized artificial cement test samples and various observations thereon.** G. BAIRE. *Rev. matériaux construction trav. publics* **1932**, 373–4.—The strength of the samples decreases in proportion to the interval between the removal from water and the time of testing. K. KAMMERMEYER

**Possible formation of the compounds of calcium sulfate during the grinding of cement.** PAUL SCHACHTSCHABEL. *Zement* **22**, 45–9(1933).—The dehydration of $CaSO_4 2H_2O$ during the grinding action and in the presence of various desiccants is described. H. F. KRIEGE

**Can cement be overground?** L. R. DAVIES-GRAHAM. *Rock Products* **36**, No. 1, 24–5(1933).—In a series of cement samples taken at various points along a tube mill, the max. compressive strengths were obtained with samples of less than max. fineness. RAYMOND WILSON

**What is the essential flour in cement?** S. RORDAM. *Rock Products* **35**, No. 15, 22–7(1932).—Ground cement clinker was sepd. in a Federal (centrifugal) separator into 0–10$\mu$, 10–25$\mu$, 25–50$\mu$ and coarser than 50$\mu$ fractions. Tests on these fractions indicate that the 0–10$\mu$ fraction is essential to early strength and plasticity. R. WILSON

**Comparison of fineness of two series of cements ground by two different methods.** KATSUZO KOYANAGI. *Rock Products* **35**, No. 17, 26–7(1932).—Of a group of cements averaging 98% fineness on the 4900 (per sq. cm.) sieve, those ground in short mills with air separators ranged from 48 to 67% in 30-micron fineness, while those ground in long mills without separators ranged from 67 to 88% in 30-micron fineness. R. WILSON

**Chemical analyses of the particles of various sizes of ground cement.** E. T. CARLSON AND P. H. BATES. *Rock Products* **35**, No. 21, 18–19(1932).—Analyses of air-sepd. fractions of finely ground portland cement clinker generally show progressive variation in compn. with particle size. The content of $3CaO.SiO_2$ is highest in the fine fraction. RAYMOND WILSON

**Aging of cements under atmospheric influence.** V. M. ANŽLOVAR. *Cement and Cement Manuf.* **5**, 361–4(1932); *Zement* **22**, 49–51(1933).—The progressive decrease in strength with age is shown more in compression than in tensile tests, more in high early strength cements than in the normal varieties and most at early ages. H. F. K.

**Water in set cement.** F. M. LEA. *Cement and Cement Manuf.* **5**, 395–9(1932). The methods used for the sepn. of "combined" water from "free" and "gel" water are arbitrary, and the relative amts. falling in the different groups are based upon definition, without fundamental chem. significance. RAYMOND WILSON

**Heat economy in the cement industry.** HANS BUSSMEYER. *Cement and Cement Manuf.* **5**, 2–11, 52–60, 133–43, 219–25, 278–84(1932). RAYMOND WILSON

**The thermochemistry of cement burning.** R. ZOLLINGER. *Cement and Cement Manuf.* **5**, 271–6(1932). RAYMOND WILSON

**The hardening and corrosion of cement.** KARL E. DORSCH. *Cement and Cement Manuf.* **5**, 337–47, 426–33(1932).—The quick setting of mixts. of portland and aluminous cements is due to action of $CaO.Al_2O_3$ on portland cement. RAYMOND WILSON

**Heat developed by cement while setting and hardening.** S. L. MEYERS. *Rock Products* **35**, No. 19, 22–6(1932).—Fineness affects rate of heat evolution but not the total

amt. Changes in total heat evolution are most readily effected by changing compn. RAYMOND WILSON

**Relation between setting time and heat evolution of cement.** A. KLEINLOGEL AND K. HAJNAL-KÓNYI. *Zement* **22**, 2–7(1933).—The heat evolution during the setting process seems to be a more definite characteristic of cement than its resistance to the Vicat needle. H. F. KRIEGE

**Determination of the setting time of portland cement.** A. C. DAVIS. *Cement and Cement Manuf.* **5**, 166–72(1932). RAYMOND WILSON

**Changing the setting time in portland cement. II.** PAUL SCHACHTSCHABEL. *Zement* **21**, 643–7, 658–61(1932); cf. *C. A.* **25**, 4679.—The humidity of the air greatly affects the change in the setting rate of cements. The change from slow to quick set is due to the formation of alk. carbonates and the destruction of gypsum in the cement. A similar change is not observed in ground clinker without gypsum. The change from quick to slow set is caused by the effect of moisture on the ground clinker itself, decreasing the amt. of gypsum needed The hydration of tri- Ca and alk. aluminates occurs in humid air, aiding the change from quick to slow set. H. F. KRIEGE

**Fineness and sieving of portland cement.** A. C. DAVIS. *Cement and Cement Manuf.* **5**, 72–80(1932).—Sieves and a standard air elutriator for cement are described. RAYMOND WILSON

**Determines sub-sieve fineness of portland cement.** E. W. REED-LEWIS. *Concrete* **41**, No. 2, 14–16(1933).—A sedimentation app. is described. R. W.

**A graphic method for determining the constituents of portland cement from the chemical analysis.** O. F. HONUS. *Cement and Cement Manuf.* **5**, 356–60(1932); cf. *C. A.* **26**, 3895. RAYMOND WILSON

**Determination of admixtures to portland cement.** P. N. GRIGOR'EV AND S. E. CHAIKINA. *Tonind.-Ztg.* **57**, 38, 62(1933).—Weigh one g. samples of cement into 600 cc. beakers, cover with 150 cc $H_2O$, heat to boiling for 10 min. with stirring, add 3.5 g NaCl and then 300 cc. of 0.5 *N* HCl Cover with a watch glass and allow to simmer 2 hrs to decompose the cement. Decant most of the liquid through a filter, cover the residue with 150-cc. 0.5 *N* HCl and heat as before. Filter and wash free from chlorides. Return the residue to the original beaker with 0.1 *N* NaOH, filter through an ashless paper, wash free from alkali with hot $H_2O$, dry at 110° and weigh. Satisfactory results are claimed with admixts. such as quartz, trass and diatomite. A further method is included based on the detn. of CaO in the mixt., the CaO content of cement being assumed as 65%. H. F KRIEGE

**Lime limits of portland cement.** EBERHARD SPOHN. *Zement* **21**, 702–6, 717–23, 731–6(1932).—The highest amts. of CaO capable of combination with the $SiO_2$, $Al_2O_3$ and $Fe_2O_3$ were detd. The satn. value in practice indicates the compn. for cement to be $3CaO.SiO_2$–$2CaO.Al_2O_3$ or $3CaO.Al_2O_3$ in cements higher in $Al_2O_3$. At least 1455° must be attained to insure complete burning When $Al_2O_3$ and $Fe_2O_3$ are present in equiv. amts the lime satn. value indicates a compn of $3CaO\ SiO_2$–$4CaO.Al_2O_3.Fe_2O_3$. A list of references is included. H. F. KRIEGE

**Tensile-strength tests of portland cement.** A. C. DAVIS. *Cement and Cement Manuf.* **5**, 441–54(1932). RAYMOND WILSON

**Behavior of portland cement when heated.** GABRIEL A. ASHKENASI. *Cement and Cement Manuf.* **5**, 240–5(1932).—Free CaO is liberated when portland cement is heated to 1000° for several hrs. RAYMOND WILSON

**Constancy of volume of portland cement.** A. C. DAVIS. *Cement and Cement Manuf.* **5**, 253–65(1932).—A description of various soundness tests. RAYMOND WILSON

**The recast analysis and its relation to the chemistry of portland cement.** L. A. DAHL. *Rock Products* **35**, No. 12, 31–3, *et seq.*(1932).—An extensive series showing relations of elementary compn. to potential and actual compd. compn. R. WILSON

**Impact resistance of cement mortars.** ALOIS FRANK. *Zement* **21**, 629–31(1932).—Mortars composed of various cements and standard sand in 1:3 mixes were subjected to pendulum impact of 0.5 kg./m. The effects of kind and length of curing, grading of aggregate, kind of cement and consistency with impact resistances are shown graphically. H. F. KRIEGE

**Application of Rankin's equilibrium diagram of the system: $CaO$–$SiO_2$–$Al_2O_3$ to the practice of cement burning.** SERHAN SOLACOGLU. *Zement* **22**, 17–22, 33–8(1933).—Numerous mixts. in the system: $CaO$–$SiO_2$–$Al_2O_3$ with const. $Fe_2O_3$ content are examd. and the values expressed in a 4-coördinate system. Cements in 9 groups of the same silicate modulus are varied as to their lime satn. values within each group. The resultant strength values showed 3 major divisions, namely, the usual portland cements high in $SiO_2$, aluminous cements of the accepted characteristics, and a new group of aluminous cements of high initial strength but excellent later values. These cements contain up to 60% $Al_2O_3$ with little or no $SiO_2$, and require high burning temps. H. F. K.

**A new cement kiln refractory.** C. H. SONNTAG. *Rock Products* **35**, No. 22, 48–54 (1932).—A magnesia brick lining in the hot zone was longer-lived than any lining material previously tried, and even at a higher price effected a saving. Steel strips between brick added to the life RAYMOND WILSON

**The theory of the rotary kiln.** RUDOLF ZOLLINGER. *Cement and Cement Manuf.* **5**, 123–8(1932).—Analyses were made on samples along the length of a kiln stopped in full production. They indicate that combination of CaO with $SiO_2$, $Al_2O_3$ and $Fe_2O_3$ is coincident with calcination of $CaCO_3$. Material in the clinkering zone contained no $SO_3$, but $SO_3$ rose to a max. of 1.16% near the upper end. RAYMOND WILSON

**Rotary kilns of high output.** E. SCHIRM. *Cement and Cement Manuf.* **5**, 315–20 (1932).—Enlarged zones, chains and other devices are described. RAYMOND WILSON

**Heat transmission in rotary kilns.** W. GILBERT. *Cement and Cement Manuf.* **5**, 417–25, *et seq.*(1932). RAYMOND WILSON

**Investigation of clinkering zone in a rotary kiln.** H. E. SCHWIETE. *Concrete* (*Mill Section*) **40**, No. 9, 36–9(1932).—Coatings on the magnesia lining of a small exptl. kiln were found by optical and x-ray means to contain $3CaO.SiO_2$. Analyses indicated the presence of small amts. of $3CaO.Al_2O_3$, $4CaO.Al_2O_3.Fe_2O_3$ and minor constituents RAYMOND WILSON

**Sintering grate and rotary kiln gain fuel economy.** F. H. ARNOLD. *Concrete* (*Mill Section*) **40**, No. 4, 53–6, No. 5, 51–6, No. 6, 45–50(1932). The Lepol cement kiln is described, heat balances are given and comparisons with rotary and shaft kilns made. Large fuel economies are shown for the Lepol kiln RAYMOND WILSON

**Hydrothermal synthesis of calcium hydroaluminates.** SHOICHIRO NAGAI. *Cement and Cement Manuf.* **5**, 205–10(1932); cf. C. A. **27**, 167.—CaO and $Al_2O_3$ or $Al(OH)_3$ were heated together with water vapor under pressure. The following compns. are provisionally assigned to the products: $3CaO.Al_2O_3.6H_2O$, $2CaO.Al_2O_3.7H_2O$ (or $6H_2O$) and $2CaO.Al_2O_3.3H_2O$ RAYMOND WILSON

**Grading curves and fineness modulus.** A. HUMMEL. *Zement* **21**, 671–5, 687–91 (1932).—Fineness modulus values are considered more practical than grading specifications. A fair bibliography is included. H. F. K.

**Recent research on concrete aggregates by the Portland Cement Association.** H. F. GONNEMAN. *Rock Products* **35**, No. 5, 36–41(1932). RAYMOND WILSON

**Values in the manufacture of light-weight concrete.** KARL L. MULLER. *Zement* **21**, 707–10, 723–7(1932). H. F. K.

**Logical use of calcium chloride in pavement concrete.** H. F. CLEMMER. *Concrete* (*Mill Section*) **40**, No. 11, 9–11(1932).—Both normal and high early-strength portland cements show increased early strength with $CaCl_2$ admixt. Use of $CaCl_2$ is particularly beneficial at low temps. RAYMOND WILSON

**Water-tight mortars and concrete. I. II.** C. R. PLATZMANN. *Zement* **21**, 737–41(1932); **22**, 23–5(1933). The suggested and patented admixts. to cements and mixes are discussed, full reference being given. H. F. KRIEGE

**Investigation on the elastic characteristics of mortars and concrete from rational pozzuolana cements.** CORRADO VITTORI. *Rev. matériaux construction trav. publics* **1932**, 353–62.—A considerable no. of tests are reported which bring out the advantages of pozzuolana cements. 11 references. KARL KAMMERMEYER

**Rate of stiffening of mortars on a porous base.** L. A. PALMER AND D. A. PARSONS. *Rock Products* **35**, No. 18, 18–24(1932). RAYMOND WILSON

**Litharge and glycerol mortars.** GEORGE W. GLEASON. *Paper Trade J.* **95**, No. 15, 33–6(1932).—Litharge-glycerol mortars, when made up with portland cement and sand, are so plastic and "fat" that there appears to be little difference in the glycerol requirement for a certain plasticity due to the type of sand used. Addn. or subtraction of relatively small amts. of glycerol changes the consistency materially. A continual increase in the strength of set mortar is experienced with increase in the glycerol content of the glycerol-water soln. used to mix the mortar, which variation should make possible an optimum concn. for given conditions. The richer mixes of litharge seem to have less strength than the leaner ones. Insofar as variation in richness of mix was carried out (1:5 parts litharge to other materials by dry loose vol.) there was only a slight decrease in compression strength, and tensile strength appears quite uniform over a wide range. G. suggests this may be due to lack of "seed" in the richer mixes; consequently much of the litharge may function as centers of crystal growth and as such are not contacted by the glycerol and do not act as bonding substances. Full strength is attained in a relatively short period of time; there is some evidence of slight recession in strength at approx. 3 days' cure. Wide variation in yield, glycerol requirements for brick mortar plasticity, shrinkage over original vol. and d. are experienced with variations in the mix. Although strength and corrosion resistance are at times related, it is not considered safe

to assume that even though some of the more economical mixes gave relatively high strengths they would prove suitable as corrosion-resisting substances. A. P.-C.

**Proposed methods for testing sheet-asphalt paving mixtures.** ANON. *Proc. Am. Soc. Testing Materials* **32**, Pt. I, 432–5(1932).—A detailed description of the technic recommended for centrifuge tube, Dulin rotarex, Barber asphalt and thimble extn. methods for detg. bitumen in sheet asphalt paving mixts. A. PAPINEAU-COUTURE

**Fiber boards. Their uses and the possibilities of their manufacture in Australia.** R. F. TURNBULL. *Australia Council Sci. Ind. Research Pamphlet* No. **36**, 51 pp.(1932). E. H.

**Composition of some Philippine hardwoods. IV.** H. M. CURRAN, F. M. YENKO, LUZ BAENS AND AUGUSTUS P. WEST. *Philippine J. Sci.* **49**, 587–92(1932); cf. *C. A.* **26**, 4840.—The Kayatan, Lago, Lamóg, Binggas, Kariskis and Bayanti trees yield wood that is hard, heavy, beetle proof, and is used for general construction in addn to cabinet work. The Bayok and Kulatiñgan woods are not heavy, but otherwise have about the same properties as the above. The Bolon is hard and heavy but not suitable for general construction. The Narra, in addn. to the above properties, has a beautiful color and seasons well. The ash content of these woods varies from 0.19 to 1.60%, lignin from 29.28 to 39.50%, and cellulose from 47.32 to 54.85%. American woods have more cellulose and less lignin. H. E. MESSMORE

**Distribution of extractive in redwood—its relation to durability.** E. C. SHERRARD AND E. F. KURTH. *Ind. Eng. Chem.* **25**, 300–2(1933).—The durability of redwood is detd. by the nature and distribution of hot $H_2O$ exts. in the tree. The results of toxicity tests toward *Fomes annosus* and of durability tests under natural conditions are given. LOUIS E. WISE

WILKINSON, F., AND FORTY, F. J.: **Bituminous Emulsions for Use in Road Works.** London: Contractors' Record, Ltd. 395 pp. 21s. Reviewed in *J. Inst. Petroleum Tech.* **19**, 150(1933).

KAIZSCHE, E. O.: **Die Festigkeit von Strassenbeton vor und nach der Belastung durch den Verkehr.** Thesis, Brunswick, 1930. 64 pp.

MEYER, WILHELM: **Die Beziehungen zwischen Betondruckfestigkeit und Betonzusammensetzung und bes. Ber. der Normenfestigkeit des Zements.** Thesis, Aachen, 1931. 54 pp.

---

**Cement.** F. L. SMIDTH & CO. A./S. Fr. 737,833, May 30, 1932. The powd. materials are wetted by an org. liquid such as crude petroleum or distn. products therefrom and this liquid is expelled almost entirely by water. The nodules obtained have a low water content.

**Cements.** THE CLEMENT MARKETING CO., LTD. Fr. 738,383, June 9, 1932. Calcined $SiO_2$ (or siliceous material) is added to colored cement in amt. sufficient to combine with the CaO liberated during setting. A clear and bright product is obtained. Cf. *C. A.* **27**, 1132.

**Cements.** LOUIS C. F. PECHIN. Fr. 738,437, April 20, 1932. Metal oxides such as FeO, $Fe_2O_3$, $Fe_3O_4$, $Al_2O_3$, $SnO_2$ and $MnO_2$ are incorporated with cement either during manuf. or at the moment of use. A more rapid hardening and greater resistance are obtained.

**Pumice cement.** G. R. SPEAKER & CO., LTD., and PERCIVAL C. COOMBES. Brit. 368,041, Feb. 17, 1931. Com. pumice is crushed, washed, graded and sepd. from dross and excess $H_2O$ before being mixed with cement to form a pumice-cement compn. App. is described.

**Vertical retort [with an internal rotor] for burning cement and like material.** FRANK C. GREENE. U. S. 1,890,662, Dec. 13.

**Apparatus for preparing clinker for making cement.** HARRY S. LEE. Fr. 738,461, June 7, 1932.

**Coating cement, etc., surfaces.** BENJAMIN E. MONTEUX and PAUL L. DURAND. Brit. 365,584, July 18, 1929. Void. Addn. to 304,288 (*C. A.* **23**, 4792). A cement, etc., pipe is coated with bitumen by first painting or spraying with an emulsion of the bitumen in $H_2O$ and then applying pure molten bitumen by immersion, spraying, etc. The process is also applicable to cement, etc., surfaces in general.

**Deaerating liquids.** EUGENE FREYSSINET and JEAN SEAILLES. Brit. 365,290,

Dec. 30, 1929. Hydraulic binding agents and mixts. intended for mortar or concrete are deaerated by passing them in a jet or thin stream into the interior of a receptacle where a vacuum exists, division of the mixt. into a thin layer being aided by simultaneous vibration or centrifugal action. App. is described.

**Bituminous compositions.** IVAN KARDOS. Brit. 363,354, Sept. 6, 1930. Blocks for paving roads are obtained by pressing moist limestone, chalk, etc., with a binder such as CaO, if necessary, so as to produce blocks of just sufficient strength to be handled which are impregnated in vacuum with liquid bitumen. These may be ground to powder for use as surfacing material, with or without the addn. of fillers.

**Bituminous compositions.** JOHN F. WAKE. Brit. 363,655, Sept. 18, 1930. A coated aggregate for road making, etc., is prepd. by applying to the aggregate a first coat of bitumen or heavy bituminous compn., then a second coat of thinned bitumen, and a third coat of mineral or vegetable oil or mineral oil contg. a little dissolved bitumen.

**Bituminous compositions.** ANTON BREUER. Brit. 363,698, July 21, 1930. A bituminous binding material which is fluid at ordinary and low temps. consists of a soln. of tar, pitch and(or) asphalt in chlorinated hydrocarbons together with other hydrocarbons. It is applied to roads or used for coating materials to be spread thereon.

**Expansion joint material.** JAMES A. MACDONALD (to Willard Warne). U. S. 1,890,260, Dec. 6. Cork granules are bonded together by their inherent resin and the material is formed with cover sheets which are flexible and impervious to moisture such as paper or cloth treated with asphalt.

**Void-containing artificial stone.** JOHN W. WARREN. U. S. 1,890,798, Dec. 13. A mixt. of cementitious material, aggregate and water is further treated with added lumps of $CuSO_4$ or $FeSO_4$ before setting in order to form voids and effect coloring.

**Use of cast blast-furnace slag in building construction.** KARL P. BILLNER. U. S. 1,890,432, Dec. 6. Relatively long pieces of porous cast blast-furnace slag may be used for floor construction.

**Structural materials such as building blocks, etc.** CLOYD M. CHAPMAN. U. S. 1,889,745, Dec. 6. Blocks or the like are formed with a layer of smooth gypsum compn. having a smooth surface in which are incorporated small particles of mineral matter such as granulated "cement rock" or slag over which is bonded a layer of cement mortar.

**Preparing wire netting for holding plaster.** CARL SCHRÖDER, SR. U. S. 1,890,023, Dec. 6. Wire netting is coated with an adhesive material such as glue over which is strewn sand or volcanic ashes, and the surface is covered with a setting material such as concrete to form a roughened stone-like covering to which the plaster will adhere.

**Molded products from lignin.** FRIEDRICH BERGIUS, FRIEDRICH KOCH and EDUARD FAERBER (to Holzhydrolyse A.-G.). U. S. 1,890,491, Dec. 13. Dry, granular, porous, brittle, deacidified substantially pure lignin residue from hydrolyzing vegetable material such as wood with HCl of high concn. is pressed in a mold to form products such as *fuel* or *building material* of self-sustaining coherent character without use of any added binder.

**Floor-covering material.** JAMES H. RILE (to Hercules Powder Co.). U. S. 1,890,128, Dec. 6. Sol. nitrocellulose is used with ethyl, methyl or butyl abietate and an absorbent such as ground cork or wood flour. Tricresyl phosphate also may be added.

**Flexible composition for floor- and wall-coverings, etc.** PAUL C. VAN DER WIELEN (one-half to N.-V. Nederlandsche Linoleumfabriek). U. S. 1,890,476, Dec. 13. Colloidal emulsions of latex, asphalt and linoxyn are mixed with coloring and filling matter in substantially colloidal suspended form, and the mixt. is then coagulated.

**Kiln and air-circulating system for drying lumber, etc.** JOSEPH I. STEEL (to Moore Dry Kiln Co. of Ore.). U. S. 1,890,756, Dec. 13.

**Composition for impregnating and preserving wood.** ALBERT H. KELSALL and OSCAR C. ALEXANDER. U. S. 1,890,650, Dec. 13. The compn. consists of rosin 24, paraffin wax 16, castor oil 0.25, quicklime 2.5, creosote 8 parts and an aniline color.

**Preserving timber.** FREDERICK A. HILL. U. S. 1,890,220, Dec. 6. A liquid compn. for treating timber is prepd. from fuel oil incorporated with about 15% of a molten mixt. of asphalt 2 and naphthalene 1 part.

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND ALDEN H. EMERY

**Solid smokeless fuel.** J. W. NAPIER. *Gas. J.* **201**, 264–6; *Gas World* **98**, 92–6 (1933).—In a review of recent British developments in coal carbonization, N. concludes that the production of a satisfactory domestic fuel is purely an economic question.

P. J. WILSON, JR.

**Efficiency of different solid fuels, especially in boiler heating.** A. NAHOCZKY.

*Mitt. berg. hüttenmänn. Abt. ungar. Hochschule Berg. Forstw. Sopron* **3**, 110–25(1931).—See *C. A.* **26**, 1748. S. S. DE FINÁLY

**Use of vegetable oils as fuel for internal-combustion engines.** A. W. SCHMIDT. *Tropenpflanzer* **35**, 386–9(1932); *Chimie & industrie* **29**, 74.—Vegetable oils are rather heavy and are suitable for use only in Diesel and semi-Diesel engines. Tests with peanut, soy bean and palm oils in a small Diesel engine showed that the engine ran satisfactorily, though some difficulty was sometimes experienced in starting; this could be obviated by starting on mineral oil. The engine developed considerably less power with vegetable oils (15 h. p.) than with gas oil (24 h. p.); this was due partly to the lower calorific value of the oil and also to the fact that the higher viscosity prevented proper atomizing and rendered combustion imperfect. A. PAPINEAU-COUTURE

**Carbonization with 103 inch vertical retorts.** F. A. RHEAD. *Gas J.* **201**, 316–18; *Gas World* **98**, 113–16(1933).—Operation of *Woodall-Duckham vertical retorts* at Wallasey. P. J. WILSON, JR.

**Modern methods of low-temperature carbonization and preparation of artificial anthracite.** CH. BERTHELOT. *Chimie & industrie* **29**, 18–44(1933).—A critical review of the scientific bases of low-temp. carbonization of coal, showing how these have been considered in the construction of commercially successful low-temp. carbonization retorts, together with an outline of principles of the methods of transforming primary tar into liquid fuels and oils for Diesel engines. A. PAPINEAU-COUTURE

**Experiences with silica in a continuous vertical plant.** O. A. TERNES. *Gas J.* **201**, 146–8; *Gas World* **98**, 96–8(1933).—In the operation of 32 continuous vertical retorts in which the fire brick had been replaced with silica, it was found that in operating at 1400° scurfing to remove C from the faces of the retorts was necessary much more frequently than when the original retorts were operated at 1220°. In spite of all precautions serious and continuous *spalling of the brickwork* occurred during scurfing. The spalling was independent of any steaming of the retorts. The expansion of the silica brick during heating-up seriously damaged the settings. P. J. WILSON, JR.

**Research and the coal industry.** C. A BASORE. *Manufrs. Record* **100**, No. 12, 29–30(1931).—Recent developments discussed are in concn., pulverizing, low-temp. distn., hydrogenation and manuf. of MeOH and other compds. J. D. S.

**Estimation of the results of coal preparation.** J. FINKEY. *Mitt. berg. hüttenmänn. Abt. ungar. Hochschule Berg. Forstw. Sopron* **3**, 31–43(1931).—The heating values of the different products of coal prepn. can be calcd. by the formula $H = x + yb + zW$, where $b$ is the percentage ash content, $W$ the percentage $H_2O$ content and $x$, $y$ and $z$ are const. for the same coal sample and must be detd. by calcn. from 3 detns. of $H$, $b$ and $W$. A linear connection between ash content and sp. gr. was found for many Hungarian brown coals on the basis of which the ash content can be detd. very rapidly. S. S. DE FINÁLY

**Pulverized coal—the significance of its analysis to the consumer.** RAPIER R. COGHLAN. *Rock Products* **35**, No. 23, 20–2(1932).—The importance of both proximate and ultimate analysis to fuel economy and efficient use in the cement kiln is shown by specific examples. RAYMOND WILSON

**Low-temperature carbonization of Lisichanskii coal.** G. V. GRITZEVICH. *Izvestiya Teplotekh. Inst.* **1932**, 1042–56.—Lisichanskii coal was carbonized at about 500° in a rotating retort at the rate of 6 tons per day, whereby about 66.35% of coke and 7.4% of tar were obtained. The yield of gasoline from the tar and the gas amounted to 1.2% (after refining 0.59%) and that of kerosene 2.53% (calcd. on the coal). The gas had an av. compn. of 14.293% $CO_2 + H_2S$ (a very high amt. of S compds.), 8.11% $C_mH_n$, 0.78% $O_2$, 10.57% CO, 5.13% $N_2$ and (from the difference) $H_2 + CH_4 + C_2H_6$ 61.117%. Cf. following abstr. A. A. BOEHTLINGK

**Gasifying the Bokovo-Khrustalnuii anthracite "AK" in Thiessen gas producers.** N. V. SHISHAKOV. *Izvestiya Teplotekh. Inst.* **1932**, 1056–60.—The analysis of the coal was: (percentage by weight) $H_2O$ 8.95%, ash 9.19%, total S 1.94%, C 76.86%, $H_2$ 1.88%, $O_2 + N_2$ (by difference) 1.18%. The heating value of the coal amounted to 6680–6755 kg. cal., the yield of dry gas on the dry fuel 4.37 cu. m. per kg., its compn.: (by vol.) $CO_2$ 2.18%, unsatd. compds. ($C_mH_n$) 0.2%, $O_2$ 0.25%, CO 31.87%, $H_2$ 9.15%, $CH_4$ 1.13%, $H_2S$ 0.13%, $N_2$ (by difference) 55.09%, its heating value 1396 cal. per cu. m. A. A. BOEHTLINGK

**Agglutinating power of coal.** E. RIEFFEL. *Ann. chim. anal. chim. appl.* **14**, 215–53(1932).—Precise directions are given for mixing finely powdered coal with sand and a little glycerol, heating at 950° and measuring the crushing strength of the resulting button. In this way a value is obtained which is a measure of the agglutinating power of the coal. W. T. H.

**Coking bituminous coals.** G. LAMBRIS. *Gas u. Wasserfach* **76**, 1–3(1933).—In detg. the influence of heat on bituminous coal, O must be excluded completely. Preheating coal at 100–200° in the presence of N or coke-oven gas contg. less than 1% O com-

pletely destroys the swelling power of the coal. $B_2O_5$ addns. have a similar effect, the swelling pressure assuming a neg. value, the tar yield decreasing with addns. up to about 1.5–2% $B_2O_5$ and the softening curve (temp. *vs.* shrinkage in mm.) becoming less pronounced as the $B_2O_5$ is increased. The results are attributed to reaction of the $B_2O_5$ with those coal constituents which have a high viscosity during the coking process.
R. W. RYAN

**Oil and gasoline from coal.** C. H. LANDER. *Sci. J. Roy. Coll. Sci.* **2**, 27–46(1932); cf. *C. A.* **26**, 2573. E. H.

**Catalytic hydrogenation of secondary gasoline of brown-coal tar.** JÓZSEF VARGA. *Math. naturw. Anz. ungar. Akad. Wiss.* **48**, 809–15(1931).—A gasoline produced by cracking of brown-coal tar which contained 50% unsatd. compds. and 3.8% S compds. was hydrogenated with 80 atm. $H_2$ in the presence of $MoO_3$. At 380°, 36.7% of the S compds. was removed; at 400°, 70.2%; at 420°, 98.5% and at 440°, 99.6%. One kg. cracked gasoline required at 440° 443 l. $H_2$, and the product contained 0.02% S and 1.5% unsatd. compds. Its sp. gr. was smaller than that of the original material and its fraction boiling under 100° was larger. The gasoline hydrogenated at 440° gave no gum when evapd. on a copper disk. The yield was 88.3 vol. % at 440°. S. S. DE F

**The reactivity of oil sulfur.** JÁNOS SZÉKI AND ALFRÉD ROMWALTER. *Mitt. berg. hüttenmänn. Abt. ungar. Hochschule Berg. Forstw. Sopron* **3**, 145–55(1931). Expts. showed that an unrefined brown-coal light oil having a S content of 4.67% may contain very small amounts of free S, $H_2S$, mercaptans, thiophenes, disulfides, thio ethers, thio esters and thiophenols. Most of the S is present in the form of very resistant heterocyclic compds. Thus, only by destroying these compds. could one produce S-free oils. Expts proved that this resistant S has only a very small influence on metals. A gasoline locomotive was oiled during winter and summer with S-contg. oil and no damage could be observed. The removal of S from such oils seems to be unnecessary and uneconomical
S. S DE FINÁLY

**Producer gas as fuel for motor vehicles.** ANON *Bull. Imp Inst* **30**, 469–79 (1932).—A brief description of the conditions necessary for the successful application of this form of power production to road vehicles, the relative advantages of wood and charcoal as fuel and some methods of charcoal manuf. A. PAPINEAU-COUTURE

**What Bristol is doing to encourage the use of industrial gas.** E STROTHER DAVIES *Gas World* **98**, No. 2529, *Ind Gas Suppl* 8–9(1933). A general discussion of the qualities of industrial fuels, together with comparisons of the costs when town gas, *fuel oil* and *producer gas* are used P J WILSON, JR

**The purification of coal gas.** GIUSEPPE LAZZARI. *Chim ind agr. biol* **8**, 509–11 (1932).—An app. is described for the regeneration of sludge masses for purification of gas. G A BRAVO

**Turbulent firing of blast-furnace gas.** OTTO DE LORENZI *Blast Furnace Steel Plant* **20**, 523–5, 528, 598–600(1932) E H

**Application of gas to the tin plate and sheet industries.** A D HOWELLS. *Gas J* **201**, 313–16(1933).—The development of a successful *gas furnace for tin pots*.
P J WILSON, JR.

**Gas in the wire-drawing industry.** J BRADBURY. *Gas J.* **201**, 199–201, 263–4 (1933).—The com. application of gas to such processes as wire drawing, tempering, tinning, enameling, etc., in a wire-drawing plant P J WILSON, JR

**A new method of building dry-gas holders.** FRIEDRICH NAUJOCKS *Gas u Wasserfach* **76**, 66–8(1933); *Gas Journal* **201**, 312(1933). A description of the new waterless gas holder erected at Berlin-Bernau, with a capacity of 70,000 cu. ft. It is cylindrical in form and one of the main novel features is the use of 2 leather pads, semi-tubular in form and suitably mounted, as seals. These are pressed against the holder walls by internal oil pressure, supplied by an elevated oil tank on the piston. The holder was operated for 6 months on air and more than 7 months on gas, without trouble of any kind. R. W. RYAN

**Production of organic compounds from coke-oven gas.** J W OSTERRIETH AND GEORGES DECHAMPS. *Gas J.* **201**, 202–6; *Gas World* **98**, No. 2531, Coking Sect. 14–17 (1933).—The com. methods for producing *methanol* and the higher *alcs.* from the constituents of coke-oven gas are outlined. P. J. WILSON, JR.

**Combustible losses in flue gases.** J. D. KELLER. *Blast Furnace Steel Plant* 20, 723–6, 781–3, 786(1932); *Heat Treating Forging* (*Furnaces*) **18**, 543–6, 595–8. E. H.

**Sulfur compounds in flue gases—elimination by water-washing methods.** H. E WALLSOM. *Chem. Trade J.* **92**, 103–4(1933).—Methods available for the removal of S compds. from flue gases are: (1) washing by water, (2) washing with a soln. or suspension of alk. material, (3) reduction of S compds. to the element S, (4) oxidation of S compds. to $H_2SO_4$, for example, and (5) interaction of the S compds. with an alk. gas and recovery of the compd. formed by water washing. In effecting the neutrali-

zation of the wash water S is formed almost entirely as sulfate, although more than 2–3% of $SO_3$ (assumed to be formed) may be removed. The capacity of water for absorbing $SO_2$ may be greatly increased by insuring its contact with the dissolved O from the flue gases in conjunction with catalysts. The value of lime in the process is briefly discussed and the optimum concns. of catalysts, above which catalysis decreases, are indicated. W. H. BOYNTON

**Tar and liquor separator.** ALEXANDER R. ANDERSON. *Gas J.* **201**, 148–9; *Gas World* **98**, 117–18(1933).—Successful sepn. of tar and liquor was effected in a modification of the type of separator recommended by the Fuel Research Board. P. J. WILSON, JR.

**New outlets for coal tar.** H. BROCHE. *Gas u. Wasserfach* **76**, 29–33(1933); *Gluckauf* **68**, 965(1932).—German tar statistics are given. Higher pitch yields may be obtained by blowing with air in the presence of $H_2SO_4$, S, alkalies, etc. Up to the present, attempts to convert tar into lubricating oils have not been wholly successful. A promising new outlet for tar lies in partial oxidation to org. acids by means of a V catalyst, and then splitting off $CO_2$ in the presence of alkalies to form benzene hydrocarbons. 100 kg. of naphthalene yields 46 kg. benzene, and a large part of the 200–300° fraction of tar oil can also be converted in this way into motor fuel. Tar-oil fractions may find greater use in Diesel engines if a suitable catalyst can be used to reduce their ignition temps. R. W. RYAN

**The measurement of the viscosity of tar.** GUY BARR AND A. L. THOROGOOD. *J. Soc. Chem. Ind.* **51**, 381–92T(1932).—In order to det. the effect of possible errors in the Hutchinson tar tester, various models were prepd. having exaggerated errors, and their times of descent were observed with 6 samples of different types. The expt. showed that the rate of fall was almost directly proportional to the net apparent wt. The abs. viscosities of the tars were detd. by the falling sphere method, with x-rays to follow the fall. It was found that the apparent viscosity of the unstirred samples was liable to vary with the thermal history, particularly with a viscous tar having a high ash content. The conversion factors deduced for the relation between abs. viscosity Hutchinson time $T_H$ and Brit. Road Tar Assocn. time $T_R$ at any one temp. are therefore put forward with some reserve. Approx. $\eta = k_H T_H(M - V\rho) - k_R T_R \rho$, where $\rho$ is the density of the tar and $M$ and $V$ are the mass and vol. of the Hutchinson tester. According to the data available $k_H = 1.67$ and $k_R = 4.44$. The viscosity at 25° may be 1.9–3.0 times that at 30°; hence it is impossible to convert $T_H$ at 25° into $T_R$ at 30°. H. W. LEAHY

**The physical properties and the microscopic structure of coke.** S. BALÁZS. *Mitt. berg. huttenmann. Abt. ungar. Hochschule Berg. Forstw. Sopron* **3**, 3–16(1931).—Micrographs may well be used to supplement the chem. and phys. examns. of coke. To investigate the total structure, slightly enlarged photomicrographs are better than much enlarged ones. These latter can only be used in detn. of residues of graphite, hydrocarbons, ash particles and sulfides in polarized light. S. S. DE FINÁLY

**The production of combustible coke in gas retorts.** J. G. KING. *Gas Eng.* **50**, 59–62(1933). Both *horizontal* and *vertical retort cokes* were burned in a *domestic open grate*, provided with grates of both the well and the barred type. Measurements were made of the heat required for ignition, the time required to reach a condition of "intense" fire, the highest rate of radiation reached, and the percentage of fuel consumed. Comparisons were made with a standard fuel of 1–1¼" *low-temp. coke*. An "intense" fire, one that is glowing at a sufficiently high temp. for normal comfort, gives off 1.05 B. t. u. per min. to a radiometer with a surface of 36 sq. in. located 3 ft. from the fire. Vertical retort coke proved superior to horizontal in burning qualities. In general, the milder the heat treatment to which the coal had been subjected during carbonization the better the burning qualities. Overheating the coke in the retorts could be avoided by a decrease in the time of carbonization without an increase in the temp. If this was accomplished by mixing coke or poorly coking coal with the coal blend, the better burning qualities of the product were offset by its greater friability. But if the coking time was decreased and more volatile matter left in the coke, decrease in gas yield per ton was accompanied by a much greater decrease in the gas required for carbonizing. P. J. WILSON, JR.

**Liquid fuels.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 366,041, July 25, 1929. Void. A small quantity (0.01–0.1%) of α-naphthol is mixed with liquid fuels, *e. g.*, benzene or cracked hydrocarbons, to prevent discoloration and gum formation. Other protective agents such as anthracene, *e. g.*, 0.005%, may be added.

**Artificial fuel.** ARTHUR A. ROBERTS. Brit. 363,679, June 28, 1929. Void. See Fr. 699,356 (*C. A.* **25**, 3466).

**Distillation of solid carbonaceous materials.** SOC. DES SCHISTES ET PÉTROLES DE FRANCHE-COMTE. Brit. 381,881, May 19, 1931. A process of distg bituminous schists is specified

**High-pressure vessel for the destructive hydrogenation of solid fuels.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,626, Aug. 21, 1930.

**Apparatus for destructive hydrogenation.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,619, Sept. 25, 1930. App. for treating distillable carbonaceous substances contg. S with H at elevated temp. is constructed wholly or partly of a material stable to H coated internally with a thin coating of Si or a metallic substance resistant to S corrosion. Suitable materials stable to H are alloy steels contg. 1–6% of Cr, Al, W, V, Co, Mn or Ni, to these may be applied a coating of Mo, W, Cr, Ti, Si, Al, Ag, Zn, brass or alloys of Zn with Fe, Ni or Cu. Examples of the construction of the app. are given. Cf. *C. A.* 27, 1140.

**Destructive hydrogenation.** CHARLES F. R. HARRISON (to Imperial Chemical Industries, Ltd.). U. S. 1,890,852, Dec. 13. In the destructive hydrogenation of carbonaceous materials in the liquid phase, all of both liquid-phase and vapor-phase reaction products are withdrawn in a single stream from the reaction zone into a sepn. zone maintained at substantially the same pressure as that in the reaction zone and at a temp. sufficient to maintain the major portion of the lower-boiling hydrocarbons in the vapor phase; the reaction products are allowed to sep. in this zone and vaporous products are withdrawn and cooled to condense the low-boiling hydrocarbons, and uncondensed gas and liquid are sepd. under high pressure. App. is described.

**Destructive hydrogenation.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,276, Dec. 18, 1930. Carbonaceous materials, including crude benzenes and benzines, are treated at high temp. and pressure with H-contg. gases obtained by the gasification of solid carbonaceous materials and from which the strongly unsatd. hydrocarbons, S compds., free O and N oxides have been removed. Suitable gases are coke-oven or illuminating gas or the gases from low-temp. carbonization of coal or distn. of shale.

**Destructive hydrogenation.** JAMES M. JENNINGS (to Standard-I. G. Co.). Brit. 365,892, June 23, 1930. Hydrocarbon oils are produced by passing a suspension in oil of solid carbonaceous material, the particles of which can pass through a 100-mesh screen, with H through a reaction zone packed with solid catalyst in lump form, under pressure above 20 atm. The oil is preferably that obtained in the process. Suitable catalysts are oxides of Cr, W and Mo, with or without Zn, Al or Mg oxides. The vapors are condensed and recirculated in known manner, and heavy oil and ash are withdrawn and sepd., the oil being returned for prepg. the suspension.

**Destructive hydrogenation of carbonaceous materials such as solid and liquid fuels.** CARL KRAUCH and MATHIAS PIER (to Standard-I. G. Co.). U. S. 1,890,434, Dec. 6. Materials such as solid and liquid fuels or their distn. or extn. products are treated with added H in the presence of an added catalyst which is immune to S poisoning, at a temp. which will promote the reaction and under a pressure of at least 20 atm. App. is described, and numerous examples with details of procedure are given. Cf. *C. A.* **26**, 3905.

**Destructive hydrogenation of materials such as coal, tar or oil.** MATHIAS PIER

(to Standard-I. G. Co.). U. S. 1,890,438, Dec. 6. The material is treated with H at 300–700° under a pressure of over 20 atm. in a plurality of stages in the presence of a catalyst such as one contg. Mo and Zn, and substantially all the carbonaceous substances of high mol. wt. which disturb the further conversion, contained in the vaporous products derived from the first stage of the process, are removed before subjecting the other vaporous products to a further conversion treatment with a catalyst such as one contg. Mo, Cr and Al which would be subject to clogging if these substances were not removed. App. is described.

**Destructive hydrogenation of materials such as coal, tar or oil.** MATHIAS PIER (to Standard-I. G. Co.). U S. 1,890,439, Dec. 6. In the destructive hydrogenation of a distillable bituminous material, in the presence of a gas contg. free H under a pressure of at least 20 atm. and at a suitable hydrogenation temp. above 350° (the bituminous material contg. constituents decomposable between 300° and the reaction temp ), the bituminous material and the hydrogenating gas are separately preheated to between 300° and 350°, and the bituminous material is then mixed with at least a part of the hydrogenating gas and the materials are heated to the reaction temp. before being introduced into the reaction chamber. App. is described.

**Destructive hydrogenation of carbonaceous materials such as tars, mineral oils, etc.** MATHIAS PIER (to Standard-I. G. Co.). U. S. 1,890,437, Dec. 6. The process is effected by use of at least 3 reaction vessels arranged in series, at a temp. of 300-700° and under a pressure of at least 20 atm., the speed of flow of the materials and the temp. in at least the first 2 vessels of the series being such that the reaction is only partially effected in these vessels. All the vapors from at least the first 2 vessels are passed through all the remaining vessels of the series while appreciable cooling in the flow of materials from one vessel to another is avoided. App. is described.

**Low-boiling hydrocarbons by destructive hydrogenation of liquid bituminous material such as tar.** CARL KRAUCH and MATHIAS PIER (to I. G. Farbenind. A.-G.). U. S. 1,890,435, Dec. 6. The material is atomized or otherwise finely dispersed in a hydrogenating gas under a continuously maintained pressure of at least 50 atm. and at a suitable hydrogenating temp. and in the presence of a catalyst (such as one contg. W) which is immune to S poisoning App is described, and various examples are given. Cf. *C. A.* **27**, 182.

**High-boiling oils from residues of distillation of destructive-hydrogenation products of carbonaceous materials.** MARTIN LUTHER and MARTIN MÜLLER-CUNRADI (to Standard-I. G. Co.). U S 1,889,926, Dec. 6. Vapors carrying finely distributed particles of liquids of low b. p. (such as damp steam) are introduced at less than atm. pressure into the residue, which is heated to above 300° but below the cracking temp. of the oils contained in the residue. App. is described.

**Apparatus for low-temperature carbonization; charging and discharging.** C. PAMART. Brit. 380,074, April 23, 1930. Addition to 268,613 (*C. A.* **22**, 1461) and 331,497 (*C. A.* **25**, 193).

**Apparatus for dressing coal.** RHEINISCHE STAHLWERKE (to Karl Lehmann). Brit 363,618, July 31, 1929. See U. S. 1,854,659 (*C. A.* **26**, 3362).

**Separating solid materials such as coal.** REMBRANDT PEALE, WM. S. DAVIES and WM. B. OAKES Brit. 365,606, Sept. 19, 1929. A process is described of cleaning coal by the action of mech jigging and upward air currents on an air-pervious support so as to stratify the material according to d. and then sepg. the layers.

**Impact pulverizer with pneumatic separator for crushing coal.** COMPAGNIE FRANÇAISE BUELL COMBUSTION. Brit 365,597, July 10, 1930.

**Elongated retort [with an internal rotor] for carbonizing coal and the like.** FRANK C. GREENE. U. S. 1,890,661, Dec. 13. Various structural and mech. details are described.

**Oils from residues such as those obtained in treating brown-coal tar oil with aluminum chloride.** EMMERICH V. PONGRATZ and HERMANN ZORN (to I. G. Farbenind. A.-G.). U. S. 1,889,932, Dec. 6. Oil-bearing residues substantially free from low-boiling hydrocarbons and contg. a metal halide such as $AlCl_3$ are subjected to dry distn. with an addn. of basic material such as $CaCO_3$ which serves to improve the yield and character of oils recovered.

**Header and tube heat-transfer device suitable for use with steam.** CHARLES E LUCKE (to Babcock & Wilcox Co.). U. S. 1,890,185–6, Dec. 6. Structural features.

**Method and apparatus for superheating and decomposing steam for water-gas production.** JENS RUDE. Brit. 363,715, Sept. 22, 1930.

**Desuperheating vapors such as steam.** WILBUR H. ARMACOST (to Superheater Co.). U. S. 1,889,739, Dec. 6. Various structural and operative details are described.

**Carbureting.** METALLGES. A.-G. Brit. 380,386, May 1, 1931. See Ger. 548,473 (*C. A.* **26**, 3652).

**Desulfurizing gases.** HELIODOR ROSTIN. Fr. 737,787, May 28, 1932. The alternate action of $H_2S$ and $SO_2$ on compds. such as $CaCO_3$, FeS or $FeSO_3$ is used to remove one or other or both of these gases from other gases.

**Equipment for water-gas generation.** HUMPHREYS AND GLASGOW, LTD., and J. E. G. FRYER. Brit. 381,046, Jan. 12, 1932.

**Gas producer.** JOHN S. HAUG (to U. G. I. Contracting Co.). U. S. 1,890,056, Dec. 6.

**Fuel-gas generator and automatic coal feeder.** FRANK C. GREENE. U. S. 1,890,606, Dec. 13. Structural features.

**Flue-gas washers.** LONDON POWER CO., LTD., S. L. PEARCE and C. F. GOODEVE. Brit. 380,513, June 19, 1931.

**Sampling tube suitable for use in periodic or continuous analysis of flue gases.** JOSEPH A. STEIN and LOUIS L. VAYDA (to Bacharach Industrial Instrument Co.). U. S. 1,890,627, Dec. 13. Various structural details of a device provided with a filter.

**Apparatus [with a perforated plate in the stream of gases] for treating gas mixtures fed to internal-combustion engines.** HERBERT V. DALGLIESH (one-half to Francis L. Browne and Nelson J. Jewett). U. S. 1,890,497, Dec. 13. Structural details.

**Gas carbureter suitable for mixing air with fuel gas.** GEORGE L. HOLZAPFEL (to Richfield Oil Co. of Calif.). U. S. 1,890,058, Dec. 6.

**Device for supplying grease-like sealing means to the sealing spaces of waterless gas holders.** MASCHINENFABRIK AUGSBURG-NÜRNBERG A.-G. Brit. 363,290, June 14, 1930.

**Temperature- and pressure-actuated indicator suitable for use with internal-combustion engine cooling systems.** H. SCHLAICH. Brit. 345,292, Dec. 20, 1928. Mech. and elec. details.

**Recovering sulfur and ammonium compounds from gas mixtures containing hydrogen sulfide.** CHRISTIAN J. HANSEN (to Koppers Co. of Del.). U. S. 1,889,894, Dec. 6. A gas mixt. contg. $H_2S$ and $NH_3$ such as coke-oven gas is treated in not less than 3 consecutive steps with a washing liquid contg. a thionate of a metal such as Fe, Mn or Zn forming sulfides insol. in water but sol. in the presence of $SO_2$, and there is provided in a medium washing step only for that quantity of $NH_3$ which is required in the conversion of the dissolved metal compds. into sulfides, and the spent washing liquor is withdrawn from this medium step.

**Purifying ammoniacal liquor.** KOPPERS CO. Brit. 380,699, Jan. 31, 1931.

**Phenols.** I. G. FARBENIND. A.-G. Fr. 738,100, June 3, 1932. Crude phenols from lignite or coal tar, or waters from the condensation of vapors produced by the carbonization at low temp. or the distn. of carbonaceous materials, are purified by treating them at 250–400° under pressure of 100–200 atm. in the presence of catalysts, particularly metals of the 6th group or their compds. The contact is of such duration that the reduction of the phenols is only secondary.

**Low-boiling products "of benzine character" by hydrogenation of crude liquid hydrocarbon material such as tars or oils.** CARL KRAUCH and MATHIAS PIER (to Standard-I. G. Co.). U. S. 1,890,436, Dec. 6. The crude liquid hydrocarbon material is distributed in a stream of H in excess of the required quantity and the mixt. is heated to 300–700° under a pressure of 100 atm. or more in the presence of an added catalyst immune to S poisoning such as one contg. Mo and Al or Cr. App. is described.

**Treating coal-tar pitch.** JOHN M. WEISS (to Barrett Co.). U. S. 1,890,349, Dec. 6. By-product coke-oven tar is distd. until a residual pitch hard enough to be ground at ordinary atm. temps. is obtained, and the pitch is coked in admixt. with bituminous coking coal in the proportion of not over 15 parts of pitch per 100 parts of coal, to obtain a composite coke.

**Materials for making coke and other products.** COMPAGNIE DES MINES DE BRUAY. Brit. 380,933, Oct. 2, 1930.

**Apparatus for the dry quenching of coke.** MAURICE BERTRAND. Brit. 363,366, Aug. 16, 1930.

**Coke ovens.** OFFICE CENTRAL DE CHAUFFE RATIONNELLE (H. Guillon, inventor). Fr. 737,779, May 28, 1932. Mech. hearth for converting coal to coke is described.

**Coke furnaces and ovens.** FIRMA CARL STILL. Fr. 738,361, June 9, 1932. Means for anchoring.

**Coke ovens; covers for resisting fluid pressure.** C. STILL. Brit. 380,038, July 10, 1931. Distillates are withdrawn from the interior of the charge in the ovens through a central detachable suction tube. Cf. *C. A.* **27**, 1150.

**Suction apparatus for removal of distillates from coke ovens.** C. STILL. Brit. 380,405, May 23, 1931.

**Apparatus and process for drying, heating, cooling, etc., of coke, coal, sand, etc.** STETTINER CHAMOTTE-FABRIK A.-G. Brit. 363,701, Sept. 23, 1929.

# 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

**Movement of petroleum products through a conical tube.** L. S. LEIBENZON. *Neftyanoe Khozyaĭstvo* **23**, 156–7(1932).—A math. treatise. A. A. BOEHTLINGK

**Flow of liquid through a cone and the possibility of using the Venturi nozzle for metering petroleum products.** D. S. VILKER *Neftyanoe Khozyaĭstvo* **23**, 158–60 (1932).—A math. discussion. A. A. BOEHTLINGK

**Total heat and specific heat of a series of fractions of petroleum oil and their relation to other properties. IX. Preparation of the samples of Venezuelan oil and the determination of some of their physical properties.** H. R. LANG. *J Inst. Petroleum Tech.* **18**, 850–2(1932); cf. *C. A.* **26**, 584. **X. Temperature variation between 0° and 100° of the specific heat of the Venezuelan fractions.** R. JESSEL. *Ibid* 853–4. **XI. Total heat of the Venezuelan fractions.** H. R. LANG. *Ibid* 855–6. **XII. Summary and general discussion of the results.** H. R. LANG AND R. JESSEL. *Ibid* 856–65 EMMA E CRANDAL

**Cementing oil wells with an accelerator. III.** V. N. KOREPANOV AND E. K. MACHINSKII. *Neftyanoe Khozyaĭstvo* **20**, 387–400(1931); cf. *C. A.* **27**, 1152.—Crude oil retards the beginning as well as the final setting of cement, the influence being only slight when less than 5% of oil is present. The addn. of an accelerator is of great advantage in this case. Clay acts as an accelerator, probably on account of the presence of alkalies in the mud. The influence of oil-well waters depends on their chem. nature. Thus, water contg. $SO_3$ retards setting and the presence of $CaCl_2$ lowers the mechanical strength of the cement. A. A. BOEHTLINGK

**Faulty cementing of oil wells in the Azneft district in 1931.** L M. MIKHURA. *Neftyanoe Khozyaĭstvo* **23**, 108 9(1932). —Faulty cementing was due to the following factors: (1) insufficient thickness of the cement ring, (2) lack of knowledge of the geological conditions, (3) improper prepn. of the mortar and (4) incorrect application of accelerators. A. A. BOEHTLINGK

**Losses through evaporation in Dossor crude oil.** V. M. LEVCHENKO. *Neftyanoe Khozyaĭstvo* **20**, 401–5(1931) —Dossor crude oil contains about 10% of a fraction b. below 200°. The losses are due to faulty storage containers and other defects in the oil-handling equipment A. A. BOEHTLINGK

**Microscopic study of certain oils which show the phenomena of high- and low-pour points.** R. W. MOORE AND L. C. BEARD, JR. *Proc Am. Soc. Testing Materials* **32**, Pt. I, 402 -5(1932).—Photomicrographs of oils subjected to various heat treatments as outlined in A. S T. M method D97–30 showed that the high and low pour points are intimately related to the soln. temp. of the waxy material in the oil; they indicate the improbability of developing a method which will be applicable to all oils. When the oil was heated to 220°F. and cooled, the anisotropic material sepd. as large clusters; when heated to 115°F., or another temp. found to give the highest pour point, very fine particles were obtained. A. PAPINEAU-COUTURE

**Hydrogenation of Esthonian oil shale and shale oil.** PAUL N. KOGERMAN AND JEAN KOPWILLEM. *J. Inst. Petroleum Tech.* **18**, 833–45(1932).—When kukkersite is hydrogenated, the kerogen absorbs about 1.8% of its wt. of $H_2$. Hydrogenation does not take place to any extent at temps. below the decompn. point of the kerogen; and the amt. of kerogen liquefied in one pass is nearly the same as the amt. of liquid yielded by distg. the shale. The products of hydrogenating at 400 410° and 250 kg./sq. cm. are mainly paraffinic and naphthenic. Higher temps. and long heating produce aromatic hydrocarbons. EMMA E. CRANDAL

**High-quality motor fuels and other products are obtainable from Esthonian shale oils.** GUSTAV EGLOFF AND E. F. NELSON. *Oil and Gas J.* **31**, No. 34, 14(1933). J. R. STRONG

**Study of oil field water analysis. I. Estimation of the sulfate radical by benzidine and errors inherent in the method. II. The volumetric estimation of calcium in the presence of magnesium.** DAVID G. JONES AND CHARLES E. WOOD. *J. Inst. Petroleum Tech.* **18**, 817–32(1932). EMMA E. CRANDAL

**Cracking of shale tar in the United States.** M. B. MARKOVICH. *Khim. Tverdogo Topliva* **2**, No. 11–12, 131–4(1931).—A review. A. A. BOEHTLINGK

**Recent developments in the Edeleanu process.** O. P. COTTRELL. *Proc. Am. Petroleum Inst.*, Sect. III, 13th Ann. Meeting, 94–101(1932). E. H.

**The influence of the chemical composition of kerosene on its burning properties in lamps.** R. A. VIROBYANTZ AND P. A. SENTZOV. *Neftyanoe Khozyaĭstvo* **22**, 331–5;

23, 91–6(1932).—Aniline points, photometrical tests, sp. gravities, *n*s, abs. viscosities at 20° and 50°, surface tensions at 15° (in dynes/sq. cm.), and pour points, were detd. on kerosenes of Russian origin. It is best to det. the chem. properties of kerosenes by the aniline point method; detns. are made before and after monohydrate treatment; photometrical tests require lamps of a certain standard; the construction of the various parts of the lamp is of great importance; Grozny kerosenes are classified as paraffin-base kerosenes. Methane hydrocarbons have the highest original illuminating properties, which are lowered in the course of burning, while aromatic hydrocarbons which have an original low illuminating power improve the latter during the burning process. Therefore, 10–20% of aromatics should be present in the kerosene when a uniform illuminating power is desired. Naphthenic acids, their salts and S compds. are detrimental and should be removed. A. A. BOEHTLINGK

**Wide variation of bleaching clays in United States to satisfy the need of petroleum refiners.** P. G. NUTTING. *Oil and Gas J.* **31**, No. 36, 14(1933).—Description and analyses for bleaching power and content of clay are given. J. R. STRONG

**Volatility index for motor fuels as aid in the utilization of light hydrocarbons.** G. S. OBERFELL AND R. C. ALDEN. *Oil and Gas J.* **31**, No. 35, 14, 78(1933).—The volatility index of a gasoline is the difference between 284°F. and the temp. at which 50% has evapd. With this index as a manufg.-control point, intelligent use can be made of the present surplus of light hydrocarbons. Among com. motor fuels differences in volatility index are responsible for most of the variations in performance. J. R. S

**Light hydrocarbons found in natural gasolines maintain rating in new antiknock tests.** H. M TRIMBLE. *Oil and Gas J.* **31**, No. 35, 16, 73(1933).—Charts are given showing the comparison of three antiknock tests with relation to the rating of natural gasolines. J. R. STRONG

**Proposed methods for determination of gum content [preformed gum] in gasoline.** ANON. *Proc. Am. Soc. Testing Materials* **32**, Pt. I, 412–14(1932).—Two different methods are described for detn. of the preformed-gum content (nonvolatile residue); one of them requires a special app. which is described. A. PAPINEAU-COUTURE

**Proposed method for determination of knock characteristics of motor fuels.** ANON. *Proc. Am. Soc. Testing Materials* **32**, Pt. I, 415–21(1932).— A detailed description of the app. and method recommended for the detn of knock characteristics, in terms of an arbitrary scale of octane nos., of gasolines and equiv. fuels for use in spark-ignition engines other than aircraft engines. It is based on the app. and procedure developed by the Coöperative Fuel Research Comm. of the Am. Petroleum Inst., Nat'l. Automobile Chamber of Commerce, Soc. of Automotive Engrs., and U. S. Bur. of Standards A. PAPINEAU-COUTURE

**Correlation of C. F. R. Laboratory knock ratings with behavior of motor fuels in service. Report of the Detonation Subcommittee of the Coöperative Fuel Research Committee.** C. B. VEAL, H. W. BEST, J. M. CAMPBELL AND W. M. HOLADAY *Proc Am. Petroleum Inst.*, Sect. III, 13th Ann. Meeting, 139–53(1932). E. H

**The coöperative fuel research apparatus and method for knock testing. A report of progress in the work of the Detonation Subcommittee.** T. A. BOYD. *Proc Am. Petroleum Inst.*, Sect. III, 12th Ann. Meeting, 46–59(1931). E. H.

**Detonation in internal-combustion engines and the evaluation of antiknock properties of fuels.** E. KUZNETZOV. *Sgoranie i Detonatziya* (*Combustion and Detonation*), *Aviaavtoizdat* Moscow **1932**, 5–23.—American and English testing methods which agree with tests carried out with Russian gasolines are discussed. Jentsch's inflammability-limit testing app. is found to be inaccurate for detg. ignition points of fuels because of the change in compn. during the expt. A. A. BOEHTLINGK

**Relationship between detonation and the structure of hydrocarbons present in gasoline.** A. D. PETROV. *Sgoranie i Detonatziya* (*Combustion and Detonation*), *Aviaavtoizdat* Moscow **1932**, 24–32.—P. discusses his expts. in which he subjected high-boiling and low-boiling normal olefins to cracking at 320–400° at elevated pressure. Low-boiling olefins are polymerized, liquid olefins of the iso-structure being formed High-boiling olefins are cracked at medium temps., forming aromatic hydrocarbons (xylene and toluene) without any addnl. formation of ethylene. This indicates the formation of aromatic compds. from diolefins; the latter were formed from olefins of the iso-structure, which were formed through the isomerization of normal olefins. The gasoline so obtained contains paraffins only in the lower-boiling fractions while above 90–100° naphthenes prevail. These paraffins are mainly of the iso-structure, which accounts for their antiknock properties. The use of silica gel for adsorbing the low-boiling gasoline is emphasized and the applicability of this method is illustrated by a few examples. A. A. BOEHTLINGK

**Localization of detonation phenomena.** MAX SERRUYS. *Compt. rend.* 195, 1376–9(1932). M. MCMAHON

JR., *et al.* *Proc. Am. Soc. Testing Materials* **32**, Pt. I, 426–31(1932).—The (1) centrifuge tube, (2) Dulin rotarex, (3) Barber asphalt, and (4) thimble extn. methods were studied collaboratively on 2 samples of the fine-aggregate type of mixt. which varied only in the character of the mineral filler used (limestone dust and portland cement, resp.). Methods (1), (2) and (4) showed relatively high probable errors for the limestone filler, and (4) a relatively high error for the portland-cement filler as well. Method (2) showed definitely high values for bitumen. "Bitumen + 200 mesh" was relatively uniform for all methods with (3) showing a tendency to be high. Method (4) showed unusually high corrections. Method (3) showed the best agreement for both mixts., with the expected probable and max. errors approx. one-half what they would be by using all systems.
A. PAPINEAU-COUTURE

**Recovery of asphaltic bitumens from solutions as far as possible without altering their properties.** J. GREUTERT. *J. Inst. Petroleum Tech.* **18**, No. 108, 846–9(1932).—Asphaltic bitumens were recovered from soln. in $CS_2$ with but small drops in penetration and rise in m. p. by the use of app. and procedure described. Distn. of the solvent was assisted by a current of $CO_2$.
EMMA E. CRANDAL

**The chemistry of wood. IV. Water-soluble polysaccharide of Eastern larch.** LOUIS E. WISE, PHILIP L. HAMER AND FLOYD C. PETERSON. *Ind. Eng. Chem.* **25**, 184–7(1933); cf. *C. A.* **25**, 4703.—Eastern larchwood yields an *arabogalactan* $[(C_6H_8O_4)\text{-}(C_6H_{10}O_5)_6]n$, sol. in $H_2O$, insol. in alc., $[\alpha]_D^{20}$ 13.02, yielding about 82% galactose and 12% arabinose on hydrolysis, and very similar to if not identical with the arabogalactan of Western larch (cf. Wise and Peterson *C. A.* **24**, 3359). Proximate methods for the *detn. of galactose and arabinose* in known mixts. were studied, and their limitations are discussed.
LOUIS E. WISE

**Distribution and nature of extractives in longleaf and shortleaf pine.** E. F. KURTH. *Ind. Eng. Chem.* **25**, 192–5(1933); cf. *C. A.* **27**, 186.—The distribution of $Et_2O$ and alc.-$C_6H_6$ exts. in *P. palustris* and *P. echinata* is analogous to that of the $Et_2O$ exts. in slash pine. The percentage of ext. increases from the bark to the pith, and in this region (except with virgin timber) increases with decrease in tree height. Tabulated data give chem. analyses of the exts. (indicating a relatively high phytosterol content in the sapwood) and differences in sapon. no., acid no., unsaponifiable matter, and NaOH-sol. matter in various parts of the trunk.
LOUIS E. WISE

**Heating value and composition of charcoals.** N. I. NIKITIN AND D. V. PALUKHIN. *J. Applied Chem.* (U. S. S. R.) **5**, 991–7(1932) —Careful exptl. work with over 20 samples of different charcoals shows that the formula: $Q = 80.51C + 273.4H$ ($Q$ is heating value, $C$ and $H$ are percentages of $C$ and $H$, resp., by wt.) is accurate within $\pm 0.6\%$ contrary to the opinion of Schorger (*C. A.* **21**, 495), who prefers the data of Klason.

**Treating hydrocarbons such as petroleum distillates for removing sulfur compounds, etc.** PAUL L. MAGILL (to Roessler & Hasslacher Chemical Co.). U. S. 1,890,881, Dec. 13. **Vapors of hydrocarbons such as gasoline are passed, at a temp. above that at which substantial amounts of the vapors condense, through a mechanically agitated**

treating mixt. comprising finely divided alkali metal intimately dispersed in a semi-solid mass of by-products produced by the reaction. App. is described.

**Hydrogenation and desulfuration of hydrocarbons.** PAUL L. F. NICOLARDOT. Brit. 366,896, Aug. 14, 1929. Void. See Fr. 696,771 (*C. A.* **25**, 2837).

**Cracking hydrocarbons.** BRITISH & DOMINIONS FERALLOY, LTD. and JAMES W. BAMPFYLDE. Brit. 364,043, July 17, 1930. See Fr. 719,190 (*C. A.* **26**, 3368).

**Refining cracked hydrocarbon distillates.** JACQUE C. MORRELL and JESSE L. ESSEX (to Universal Oil Products Co.). U. S. 1,890,229, Dec. 6. The distillate is subjected to the action of borax at a temp. substantially above atm. temp. but below cracking temp. to remove gummy substances and oily polymers. U. S. 1,890,230 relates to a similar process in which an adsorbent of the clay type is used in admixt. with the borax.

**Distilling hydrocarbon residues.** N. V. DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Brit. 363,972, Aug. 13, 1930. In the manuf. of asphalt from a petroleum residue having an asphaltene content of 5% or less, in which the residue is "blown" to increase this content to 7% or more, the product is distd. with or without steam or reduced pressure.

**Hydrocarbon-oil-cracking apparatus.** CARBON P. DUBBS (to Universal Oil Products Co.). U. S. 1,890,316, Dec. 6. Oil is passed successively through each of a plurality of heating coils within a furnace and intermediate the successive coils is passed through vapor chambers to sep. vaporous constituents; from the last of the coils the oil is passed to an enlarged vapor chamber in which substantial conversion takes place; the evolved vapors are dephlegmated and reflux condensate is returned to the enlarged vapor chamber; unvaporized reflux condensate and lighter unvaporized residual oil in the vapor chamber are continuously returned to the inlet of the first heating coil, and the conversion operations are conducted under superatm. pressure. Various structural details are described.

**Desulfurizing hydrocarbon oils.** GENERAL TECHNICAL CO., LTD. Brit 365,571, Aug. 2, 1929. Void. See Fr. 695,004 (*C. A.* **25**, 1984).

**Purifying mineral oils.** ANGLO-PERSIAN OIL CO., LTD. and ALBERT E. DUNSTAN Brit. 364,204, Oct. 10, 1930. See Fr 725,186 (*C. A.* **26**, 4943).

**Breaking emulsions such as those of crude mineral oils.** FRITZ E. FUCHS (to Samuel J. Singer). U. S. 1,890,849, Dec 13 Pine oil is used to decrease the viscosity at low temps. of emulsion breakers contg. a sulfonated oil material.

**Resolving mineral oil emulsions.** WM. B. LERCH (to Curo Process Co.). U. S 1,890,789, Dec. 13. A demulsifying agent is used comprising the reaction product of sulfonated cottonseed oil with a chlorinated tarry material formed by chlorinating tarry material of the polyolefin, cyclopentene and cyclohexene series such as a chlorinated Blau-gas tar.

**Refining oils.** HERMANN FRISCHER. Fr. 737,876, May 31, 1932. Residual $H_2SO_4$ from the refining of tar or mineral oils is regenerated by treatment with $HNO_3$ or oxides of N of a high degree of oxidation.

**Treating spent adsorbent material used in oil treatment.** IRA K. FULLER (to Contact Filtration Co.). U. S. 1,890,255, Dec. 6. Material such as activated clay which has been used for treating oil is treated with an oil solvent such as gasoline for removing the oil, dried, mixed with a solvent (such as $C_6H_6$ and methylethyl ketone) for adsorbed matter, filtered and washed with fresh solvent to sep. residual adsorbed material.

**Treating spent adsorbent material used in oil refining.** IRA K. FULLER (to Contact Filtration Co.). U. S. 1,890,284, Dec. 6. Spent material such as activated clay which has been used in refining or decolorizing oil is mixed with a relatively large quantity of an oil solvent such as gasoline and after filtering the filter cake is treated with a relatively small quantity of solvent to remove remaining dil. oil soln.

**Destructive hydrogenation of liquid hydrocarbons.** STANDARD-I. G. CO. Fr 737,615, May 25, 1932. The hydrocarbons are sepd. into 2 or more fractions which are heated in sep. heating coils and pass together to the reaction chamber for treatment with H. The highest fraction is preferably wholly vaporized below 370° and H may be mixed with this fraction in the heating coil.

**Hydrocarbon motor fuels.** CHARLES D. LOWRY, JR. and CHARLES G. DYER (to Universal Oil Products Co.). U. S. 1,889,835, Dec. 6. Deterioration of distillates such as gasoline contg. cracked unsatd. hydrocarbons is inhibited by adding a small quantity of the tar fraction obtained in the destructive distn. of wood, which checks gum formation in the distillate. U. S. 1,889,836 relates to the similar use of an oily distillate of hardwood tar, b. 240–300°.

**Motor fuel.** I. G. FARBENIND. A.-G. Fr. 738,368, June 9, 1932. Antiknock fuels for motors are made by destructive hydrogenation of carbonaceous materials in the

presence of catalysts, first under powerful conditions of hydrogenation at a low temp. (*e. g.*, 400–450°, with sulfides of heavy metals as catalysts), while maintaining a partial pressure of about 10% in the reaction vessel for the improved products b. between 40° and 200°, and then destructively hydrogenating at 500–600° in the presence of catalysts. The constituents b. above 200° from the 1st step are preferably returned to the first hydrogenating zone. A partial pressure of more than 10%, preferably more than 20%, is maintained in the 2nd step for the product b. between 40° and 200°.

**Refining gasoline stock.** ARTHUR LACHMAN (to Richfield Oil Co. of Calif.). U. S. 1,890,516, Dec. 13. Gasoline stock which is pos. to the "doctor test" is commingled with an aq. soln. of an alkali compd. such as NaOH having a $p_H$ greater than 7.4 contg. comminuted activated charcoal and air, to convert corrosive "sulfur hydrocarbons" into non-corrosive "sulfur hydrocarbons" and render the gasoline neg. to the "doctor test," and the purified gasoline stock is then sepd. from the excess alkali salt soln. and other assocd. treating agents and products of reaction. An arrangement of app. is described.

**Lubricating oils.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,823, Dec. 17, 1930. Hydrocarbon oils having a substantial content, *e. g.*, 20–80%, of paraffin wax are dehydrogenated, the products sepd. by solvents into a fraction contg. more than 14.5 parts H to 100 parts C by wt. and a fraction poorer in H, and the former, which may be mixed with hydrocarbon which is liquid at 50–300°, is subjected to catalytic condensation and (or) polymerization.

**Lubricating oils.** DONALD A. HOWES and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 363,846, Jan. 5, 1931 See U. S. 1,877,664 (*C. A.* **27**, 187)

**Lubricating oils.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,110, Sept. 22, 1930. Improved lubricating oils are obtained by enriching in H, lubricating oils of low viscosity, which may contain paraffin waxes, cracking the enriched oils and condensing the cracked products with condensing and (or) polymerizing agents, chlorides of Al, Zn, Fe, B and P, Zn dust, etc. The oils are enriched by treatment with H at about 390–430°, preferably in the presence of catalysts of the 6th group. Alternatively the oils may be sepd. into H-rich and H-poor fractions by differentiating solvents, *e g.*, $SO_2$, PhOH, $PhNH_2$, etc., and the H-poor fraction hydrogenated. The cracking is at about 400–600°, preferably in the presence of catalysts. The condensation is at about 150°, preferably in the presence of substances of large surface area, *e. g.*, bleaching earth, active $SiO_2$, etc.

**Lubricating oils.** STANDARD OIL DEVELOPMENT CO. Fr. 737,836, May 30, 1932. Lubricating oils are prepd. by treating petroleum oil by a selective solvent such as PhOH and submitting the refined product contg. a part of the solvent to distn. in the presence of an adsorbent clay. An app. is described. Cf. *C. A.* **27**, 1502.

**Dewaxed paraffin-base lubricating oil.** EDWIN R. LEDERER (to Texas Pacific Coal & Oil Co.). U. S. reissue 18,676, Nov. 29. A reissue of original pat. No. 1,803,941 (*C. A.* **25**, 3825).

**Lubricant containing alkali metal sulfonate.** ARMAN E. BECKER (to Standard Oil Development Co.). U. S. 1,888,974, Nov. 29. A petroleum lubricating oil is used together with an alkali soap of a fatty acid such as Na oleate and an oil-sol. alkali metal sulfonate derived from mineral oil which serves to facilitate feeding the lubricant by a wick or the like.

**Solutions of asphalt, etc.** ANDRÉ DIEBOLD. Fr 738,198, June 6, 1932. A metallic aspect is given to coatings made from solns. of asphalt, etc., by incorporating therewith a metal powder such as Al.

**Asphalt from residuum oil.** HAROLD B. PULLAR. U. S. 1,889,697, Nov. 29. In a continuous process, a moving body of oil is heated and reduced to a fine state of subdivision (as by spraying) and then brought into intimate contact with a plurality of streams of air, finely divided, under relatively low pressure in an enlarged reaction zone; volatile matter is separately removed and the desired asphaltic product is recovered and the vol. and pressure of the air introduced are controlled relative to the pressure of the oil so that these pressures are substantially equalized. App. is described.

**Apparatus for extracting wood.** PAUL DELEPLANQUE. Fr. 737,468, May 24, 1932.

## 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

**Cellulose and its place in industry.** PHILIP C. SCHERER, JR. *J. Chem. Education* **10**, 131–40(1933). E. H.

**Cellulose from the leaves of Phoenix dactilifera.** F. SORGÈS. *Lavori ist. botan. Palermo* **3**, 49–55(1932).—The leaves treated by the NaOH and the Cl methods yield,

resp., 30.9 and 37.5% (on dry matter). The alternative treatment with alkali and acids gives 85–88% cellulose. Cellulose contains, on an av., $H_2O$ 2.24 and ash 1.23%, and has: Cu no. 1.8; loss on hydrolysis by heating 5 min. 4.07% and by heating 1 hr. 17.2%; increase in wt. by mercerization 25.4%; decrease in wt. by acid purification 5.4%. It contains 12% hemicellulose, but no pentosans. Cellulose acetate is sol. in acetone 2:1. G. A. BRAVO

**The size of the cellulose molecule and a glance at its technical significance.** W. KARO. *Nitrocellulose* **3**, 184–6, 202–4(1932).—A review. E. M. SYMMES

**The structure of cellulose fibers.** D. KRÜGER. *Zellstoff u. Papier* **13**, 9–12 (1933).—A review and discussion, with 28 references, of the recent literature on the methods of detg. the structure of the cellulose fibers. S. I. ARONOVSKY

**The solubility of cellulose in cadmium- and zinc-tetrammino hydrates.** GIULIO TOCCO AND EMILIO DEBENEDETTI. *Boll. reparto fibre tessili staz. sper. ind. carta e studio fibre tessili vegetali* **4**, 195–8(1932).—According to Traube's investigations (*Ueber Kupferoxydammoniak-Zellulose* **1927**, 95) only Schweizer's soln. can dissolve cellulose. But by substituting Zn or Cd for Cu in Schweizer's soln. contg. cellulose, at temp. <20°, it is possible to obtain a soln. contg. a max. of 5% cellulose. The Zn soln. is colorless, that of Cd slightly yellowish, and the latter has a very high viscosity. Cellulose is directly sol in the Cd- and Zn-tetraammino hydrates. G. A. BRAVO

**Esterification of cellulose and cellulose esters. IV. Selective absorption of the component of mixed acid by cellulose nitrate.** KATSUMOTO ATSUKI AND MASANORI ISHIWARA. *J. Soc. Chem. Ind., Japan* **35**, Suppl. binding No. 12, 587–91(1932); cf. *C. A.* **23**, 4816.—After nitration of cotton with a mixt. of $HNO_3$, $H_2SO_4$ and $H_2O$ the ratio $H_2SO_4$:$HNO_3$ of the acid inside the fiber is less than that outside, because of the greater diffusion velocity of $HNO_3$ which is selectively absorbed by the cellulose nitrate. $H_2O$ diffuses with the $HNO_3$ and is also formed by esterification, so that equil. is reached with the acid inside and outside the fiber having different compns. This diln. and the equil. established account for the impossibility of obtaining true cellulose trinitrate. C. E. HRUBESKY

**Procedures for the manufacture of films from cellulose hydrate. Precipitation and drying.** E. SEDLACZEK. *Kolloid Z.* **62**, 122–8(1933); cf. *C. A.* **26**, 4467.—German and Swiss patents are discussed. A. FLEISCHER

**The manufacture of cellulose acetate.** V. E. YARSLEY. *Brit. Plastics* **3**, 344, 346, 524–5, 544, 546(1932).—A review of patents. E. H

**Acetic acid recovery in cellulose acetate production.** FRITZ OHL. *Rayon Record* **6**, 559–61(1932); cf. *C. A.* **27**, 1504.—A review of the patent literature relating to the different processes available for the recovery of AcOH from the dil. aq. soln which results from the production of cellulose acetate. MILTON HARRIS

**The production of gramophone records from cellulose xanthate.** H. COURTNEY BRYSON. *Brit. Plastics* **4**, 48–50, 90–92, 160–2, 206–7(1932). E. H.

**Benzylcellulose.** N. I. NIKITIN AND M. A. AVIDON. *Mitt. forsttech. Akad* (U.S.S.R.) No. **1**, 23–31(1932); cf. Gomberg and Buchler, *C. A.* **16**, 59; Okada, *C. A.* 25, 5759.—Benzylation is principally completed in the first 8–10 hrs. of the reaction; any further action is of no practical value. A small addn. of xylene to the reaction mixt causes a small increase in the degree of benzylation; large amts. of xylene greatly retard the reaction. The secondary reaction between $PhCH_2Cl$ and 25% NaOH proceeds very slowly; in 6 hrs. only 3–6% of NaOH is consumed. With 13% NaOH from 70 to 100% of the NaOH is consumed in 3 hrs., depending on the speed of agitation and the degree of emulsification. By a single treatment of cellulose with 25% NaOH and $PhCH_2Cl$ there cannot be obtained a product with more than 70% C content (dibenzylcellulose). The use of concd. NaOH (50% and over) in the beginning of benzylation greatly retards the reaction. The most highly benzylated products, contg. 2.5 and more benzyl groups, were obtained by using unpressed alkali cellulose (soaked in 25% NaOH) and the subsequent addn. of solid NaOH. Pressed-out alkali cellulose soaked in 25% NaOH gave best results. Raising the temp. from 100° to 125° did not increase the degree of benzylation, and it caused depolymerization of the product; at 150° the product is partially decompd. In *mercerization* with LiOH 10% concn. is sufficient. A second treatment of benzylated alkali cellulose with $PhCH_2Cl$ increases somewhat the no. of benzyl groups in the product, while a 3rd treatment produces little change in its C content. CHAS. BLANC

**Melting methylcellulose.** K. HESS, E. GARTHE AND C. TROGUS. *Cellulosechemie* **10**, 156–7(1932).—Samples of repptd. methylcellulose heated for 10–15 min. at about 25° above the m. p. (about 240°) and then cooled yielded brown-colored prepns. which resulted in the same unchanged Röntgen interference pictures. A short heating period caused practically no loss in wt., whereas longer heating caused wt. losses up to 20%. Methylcellulose prepd. from mercerized cotton linters or "copper silk" by the $Me_2SO_4$-

alkali procedure, heated under similar conditions, yielded pale yellow products with entirely new interferences, believed by the authors to be due to a new methylcellulose, represented by them as *methylcellulose III*. The prepns., after the melting, all show good crystn. characteristics. Four Röntgen-diagram pictures and two tables.
C. A. BRAUTLECHT

**The action of colloids on the saccharification of cellulose.** NERINA VITA AND E. SALMOIRAGHI. *Ann. chim. applicata* **22**, 683–6(1932).—Samples of cotton, previously dried, were heated with $H_2SO_4$ (1.18 sp. gr.): (1) on a steam bath and (2) in an autoclave at 120°. The same tests were repeated in the presence of colloidal C, as well as colloidal S, and the amt. of glucose formed after 20 and 40 min. and 1, 2 and 3 hrs. was detd. The amts. of glucose formed were very nearly the same in each of the 3 tests, *i. e.*, with $H_2SO_4$ alone, and with colloidal S or C; heating in an autoclave raised the amts. formed in all cases. The percentages of glucose formed rise to a max. (about 20%) in 1 hr., and then gradually decrease. In the presence of the colloidal suspensions less glucose is destroyed; hence, though the rate of its formation is a little slower, less is destroyed and the net result is that the amt. of glucose is the same as in the absence of C and S.
A. W. CONTIERI

**The chemical formula of lignin.** PETER KLASON. *Svensk Pappers-Tidn.* **35**, 717–18(1932); **36**, 47–8(1933); cf. *C. A.* **26**, 6132.—K. takes exception to Hägglund's use of Schorger's method of distg. AcOH in vacuum and the conclusion he draws therefrom regarding the constitution of lignin.
WILHELM SEGERBLOM

**Acetic acid from spruce wood.** ERIK HÄGGLUND. *Svensk Pappers-Tidn.* **35**, 749–50(1932); **36**, 48(1933); cf. *C. A.* **26**, 6133.—H. produces addnl. data to show that his AcOH detns. by the Schorger distn. method, as published originally in *Acta Acad. Aboensis, Math. Phys.* **6**, 15(1932) were correct and that Klason's exceptions (cf. preceding abstr.) are not justified.
WILHELM SEGERBLOM

**The composition of spruce wood.** F. W. KLINGSTEDT. *Svensk Pappers-Tidn.* **35**, 750–5(1932).—K. reviews the work of Hägglund and of Klason (cf. 2 preceding abstrs.) and points out that Klason's contention that the Ac groups in spruce wood are joined to the lignin has prevented him from interpreting Hägglund's results correctly. K suggests further investigation to det. the actual position of the MeO and Ac groups in spruce wood.
WILHELM SEGERBLOM

**Cellulose and rayon.** ERNST BERL. *Sci. J. Roy. Coll. Sci.* **2**, 9–18(1932).—A review.
E. H.

**Spinning quality of cellulose acetate.** FRITZ OHL. *Kolloid-Z.* **62**, 85–91(1933).—Spinning quality as measured by the length of fiber which can be drawn from a soln. is independent of the acetate content, but is very dependent on the method of prepn. of the acetate. For a given method, the spinning quality increases with viscosity of the soln., and shows a max. at about 10% concn.
ARTHUR FLEISCHER

**Notes on the manufacture of viscose.** R. THIBAULT. *Russa* **7**, 789–93, 1051–5, 1133, 1135(1932).—A discussion giving practical hints on the operation of viscose plants to obtain optimum results.
A. PAPINEAU-COUTURE

**Investigations of viscose by G. Kita, et al. XXXVI. The spinometer and its use. 4.** SIN-ITIRO IWASAKI AND EIJI SUGINO. *J. Soc. Chem. Ind., Japan* **35**, Suppl. binding No. 12, 551–3(1932); cf. *C. A.* **26**, 3663.—The spinnability of viscose prepd. from alkali cellulose aged 1 (I), 4 (II) and 9 (III) days and from a mixt. of I and III proportioned so the Duclaux const. of the sp. viscosity of a Cu-$NH_3$ soln. was equal to that of II, was different for each viscose in spinning baths contg. glucose, $ZnSO_4$ or $H_2SO_4$. The Hottenroth coagulability no.-ripening period relation was almost identical for the different viscoses.
C. E. HRUBESKY

**Variations in the viscosity of viscose as a function of temperature.** R. AIMAUD. *Russa* **7**, 1135, 1137(1932).—When the temp. of viscose soln. is raised to its coagulation point (67°), the viscosity decreases until 55° is reached and then rises slightly up to the coagulation point. When the temp. of viscose soln. is raised to slightly below the coagulation point and then allowed to fall, the viscosity curve for falling temp. is practically identical with that for rising temp Hence below the coagulation point the change in viscosity is reversible.
A. PAPINEAU-COUTURE

**The Swedish paper and pulp industry in 1932.** ANON. *Svensk Pappers-Tidn.* 35, 810–12 (1932)(in English).—Statistical. Sweden is compared with other countries.
WILHELM SEGERBLOM

**Decomposition of straw with sulfurous acid and acid sulfites.** S. HILPERT AND F. JORDAN. *Angew. Chem.* **46**, 73–6(1933).—Straw was treated with $SO_2$-$H_2O$ mixts. of varying compn. at temps. of 90–130°. Difficulties in decompn. were caused by lignin only. Decompn. with low $SO_2$ concns. is improved by addn. of small amts. of $NH_3$. 9 literature references.
KARL KAMMERMEYER

**Pulps and papers from Southern woods; needs and possibilities of diversification.**

C. P. WINSLOW. *Manufacturers' Record* **101,** No. 12, 20–2; No. 13, 21–4(1932).—Nearly 1/4 of the total capacity of Southern mills is devoted to producing pulps of one main type, namely, unbleached sulfate or kraft. The need and possibilities of diversification are discussed. The established sulfate process can be so modified that a light-colored or white kraft can be produced; the minor changes required in equipment are briefly outlined. Expts. have shown that improvements result from the use of $NH_3$ or Na salts in place of Ca in standard sulfite liquor. A. W. FURBANK

**Action of ammonium sulfite on white fir.** W. S. HEPHER AND E. C. JAHN. *Paper Trade J.* **95,** No. 19, 33–6(1932).—By use of lowland white fir (*Abies grandis*) it was found that removal of lignin increases with increase in the amt. of chemical used, in the duration of digestion up to 6 hrs., and in temp. The amt. of lignin in the residual wood decreases with the amt. of chemical used and with increased time of digestion up to 6 hrs., but increases with increased temp. above 160°. The cellulose content of the residual wood increases with increased amt. of chemical used up to 50% of the dry wt. of the wood, then decreases; lower amts of chemicals (15–25%) result in degradation of the cellulose; increased cooking time yields residues of higher cellulose content, but there is increased degradation of the cellulose based on the original wood. Addn of $NH_4OH$ to the $NH_4$ sulfite increases the yield, decreases degradation of cellulose and increases pentosan removal. Addn. of $SO_2$ decreases the removal of pentosans and the yield, increases degradation of the cellulose but increases the cellulose content of the residual wood. Yield is decreased with increased time of cooking and with increased temp.; it varies comparatively little with increased amts. of chemical at const. time and temp. of residual wood but follows the same trend as the cellulose content. Pulp in yields of 72–3% may be obtained by digesting lowland white fir chips with 26–35% $NH_4$ sulfite for 6–7 hrs. total cooking time and with a max. temp of 175°; the cooked chips are readily defibered in a rod mill A. PAPINEAU-COUTURE

**Utilization of knot waste from Fink separator in the Sokol mill.** G. A. KALISTRATOV AND K. V. KHODAKOV. *Bumazhnaya Prom.* **11,** No. 11, 63–8(1932).—A more efficient sepn. of pulp-wood knots is discussed CHAS. BLANC

**Ways for investigation of pulp wood.** A. MALINOVSKII. *Bumazhnaya Prom.* **11,** No. 11, 42–5(1932).—The production of pulp is considered a problem of the colloidal condition of the pulp wood. CHAS. BLANC

**Some variations in cooking kraft pulp.** RALPH REID. *Paper Trade J.* **95,** No. 19, 38(1932).—There is a close relationship between the freeness of kraft pulp after a given beating time and max. strength of the pulp There is a marked relationship between the Cl no. and the beating time required to obtain a given freeness, a method suitable for mill control is the one developed by Kramfors A/B which consists in exposing a given wt of moist pulp to a measured vol of Cl gas for a definite time (15 min. is satisfactory) and obtaining the amt of Cl absorbed by measuring the residual gas. The amt of alkali required to cook to a desired degree varies by as much as 10% according as the wood was cut in summer or winter, the latter requiring the larger amt of alkali. A. PAPINEAU-COUTURE

**Bleaching southern kraft.** R. H. STEVENS. *Paper Ind.* **14,** 501–3(1932) A brief discussion of the advisability of producing bleached kraft pulp in the southern States and of the precautions required in bleaching kraft. A. PAPINEAU-COUTURE

**Bleaching groundwood.** W. HIRSCHKIND. *Paper Trade J.* **95,** No. 19, 31–2; *Pulp Paper Can.* **33,** 489–90(1932).—The advantages of hyposulfite as bleaching agent for groundwood are: very rapid action even at low temp.; higher brightening effect than that of $SO_2$ or bisulfites; it gives very striking results on very dark and discolored woods; the amt. necessary depends on the effect desired and often does not exceed a few tenths %, subsequent washing being therefore unnecessary; it does not change the $p_H$ of the pulp during the brightening process and can be carried out in ordinary equipment. A. PAPINEAU-COUTURE

**The use of chlorine in bleaching sulfite pulp. XV. Swedish Paper and Cellulose Engineering Association Research Committee.** ARNE WALLER. *Svensk Pappers-Tidn* **36,** 8–17(1933).—The bleaching of sol. and oxidized parts in 1-step and 2-step procedures are compared. High pulp concn. seems to help the bleaching. W. S.

**Direct chlorination as an aid in the bleaching of sulfate pulp.** JOHN D. RUE AND JAMES S. SCONCE. *Paper Trade J.* **95,** No. 17, 54–62(1932).—The rate of reaction of Cl on pulp proceeds extremely rapidly for the first 2 or 3 min., then drops quickly to a very slow rate. Temp. and consistency modify these rates of reaction only to a moderate extent. The addn. of CaO after the first few min. increases the rate of reaction for a limited time and prevents serious chem. and phys. degradation of the pulp. A 2-stage lab. bleaching process has been developed, the 1st stage of which consists of direct chlorinating for a period of 5 min., alkalizing with CaO and allowing the remaining available Cl to exhaust; the 2nd stage is a typical hypochlorite bleach. Data are presented

showing the effect of various proportionings of Cl between stages on the chem. and phys. properties of pulps. Bleaching data and pulp properties are given for several full-bleached kraft pulps. The process has been developed on a com. scale, and details of equipment and process are described. A. PAPINEAU-COUTURE

**Annual report of pulp bleaching for 1932.** LADISLAV RYS AND ALFRED BÖNISCH. *Zellstoff u. Papier* **13,** 53-7(1933); cf. *C. A.* **26,** 4467.—A review with 41 references. S. I. ARONOVSKY

**Pulp classification and specifications.** ANON. *Paper Trade J.* **96,** No. 1, 37–50 (1933).—A report of the symposium on pulp classification and specifications held during the meeting of the Tech. Assoc. of the Pulp & Paper Ind., Holyoke, Sept. 15, 1932. A. PAPINEAU-COUTURE

**Temperature control on pulp grinders.** MALCOLM B. HALL. *Paper Ind.* **14,** 537, 539(1932).—A brief discussion of the advantages of automatic overhand control of grinder temp. A. PAPINEAU-COUTURE

**The problem of classification of chemical pulps.** C. C. HERITAGE. *Paper Trade J.* **95,** No. 23, 41–4(1932).—Attention is drawn to the use requirements of pulps and the division of pulps into classes as basic to the problems involved in evaluation and specification, and a tentative scheme of classification is suggested. A. PAPINEAU-COUTURE

**Design and care of pulp strength testing equipment.** PAUL BORONOW. *Paper Trade J.* **95,** No. 24, 27-9(1932).—The fundamental requirements on which the Valley Iron Works pulp strength testing equipment is based are outlined, and a specimen procedure which has been worked out for this equipment is described. A. P.-C.

**The characterization of pulps and stuffs.** P. K. BAIRD AND R. H. DOUGHTY. *Paper Trade J.* **95,** No. 24, 30-4(1932).—An analysis of pulp and stuff properties which may serve in their characterization, an outline of available methods of tests and a classification of these test methods with a suggested decimal scheme for their grouping under logical and proper headings are given. A. PAPINEAU-COUTURE

**Routine control testing of pulp.** FREDERICK W. BRADSHAW. *Pulp Paper Can.* **33,** 481-4, 518(1932).—The British standard method of making pulp test sheets (I) is not suitable for routine testing on account of the time required for drying. A new procedure (II) is described whereby drying and conditioning are effected in 20 min. by blowing heated air for 5 min. over the test sheets (held in special drying rings to prevent shrinkage) and then blowing unheated air for 15 min. to condition the sheets; the drying and conditioning should be effected in a const.-humidity and -temp. atm. In comparative tests the max. difference in the results obtained with I and II, resp., was 2.3%. A. PAPINEAU-COUTURE

**Caustic soda and the pulp and paper industry.** ROBERT T. BALDWIN. *Paper Trade J.* **95,** No. 26, 21-3(1932).—An outline of the part played by NaOH in pulp and paper making. A. PAPINEAU-COUTURE

**The sulfite cellulose process.** ERIK HAGGLUND. *Svensk Kem. Tidn.* **44,** 163-9 (1932)(in German); cf. *C. A.* **27,** 839.—Solid lignosulfonic acid is considered analogous to permutite in reversible exchange of H and alkali ions. This property is demonstrated by adding the compd. to sucrose solns. and noting the change in rotation. Sucrose soln. in amt. to give $[\alpha]$ 42° when completely inverted changed from +12° to −2.9° in 1380 min. If something is added to prevent release of the H-ion, no such action takes place. A. R. ROSE

**Chemistry of the sulfite-cooking process. XXVI. Investigations of lignosulfonic acid.** ERIK HAGGLUND AND RICHARD HEDLUND. *Svensk Pappers-Tidn.* **35,** 612–17 (1932), cf. *C. A.* **27,** 839.—During treatment with HCl a large part of the lignosulfonic acid seems at first to go into soln.; thereafter it gradually polymerizes and ppts., the amt. of pptn. depending on the degree of sulfonation of the lignin. W. S.

**The Babcock & Wilcox-Kimberly-Clark circulating and indirect-heating system for the sulfite pulping process.** LLOYD LANG. *Paper Trade J.* **95,** No. 22, 26–36(1932); cf. Swanson and Smith, *C. A.* **26,** 5204.—A description of the system developed and installed at the Kimberly, Wis., mill. Advantages proved by com. application are: increase in production capacity of 24-28% without increase in cooking time; increase of 5-8% in yield per unit of wood; saving of 20–25% in S, 10% in lime and 30–40% in steam, saving in the steam plant on account of return of all steam as condensate; improved steam-plant balance; possibility of utilizing any source of low-pressure steam; improved pulp color, strength and quality; possibility of producing pulp of various qualities not practicable by direct cooking; control of uniformity and duplication of cooking conditions; reduced relief cooling requirements, screenings and bleach consumption. A. PAPINEAU-COUTURE

**Utilization of sulfite waste liquor.** H. K. BENSON. *Paper Trade J.* **95,** No. 20, 31–4(1932).—A consideration of processes available for the conversion of sulfite waste

liquor into possible useful commodities: adhesive, binder, tanning material, alc., fuel, agr. products, production of dyes, resins, lacquers and other chemicals.
A. PAPINEAU-COUTURE

**Sulfite-digester circulation methods.** G. L. M. HELLSTROM. *Pulp Paper Can.* 33, 491–3(1932).—The basic principles and the difficulties inherent to the various types of sulfite circulation systems are briefly discussed. These difficulties have been overcome in the *Hellstrom system* by drawing the liquor, and whatever chips may follow, from the lower (or upper) part of the digester and introducing it again at the top (or bottom) of the digester, the former procedure being preferable. No screens or perforated pipes are required. No heater is used, but steam is introduced and mixed with the cooking liquor outside the digester by means of an injector. The chief advantages of the system are simplicity, effectiveness and comparatively low cost, even when made entirely of stainless steel.
A. PAPINEAU-COUTURE

**A rapid permanganate method for determining the degree of digestion of sulfite and sulfate pulp.** DAVID JOHANNSON. *Svensk Pappers-Tidn.* 35, 615–17(1932).—J. comments on the report of the standardizing committee (cf. *C. A.* 26, 6123) and points out that for easily bleached pulps the Svartvik $KMnO_4$ method, giving the results in percentage of Ca hypochlorite, is a rapid method for plant control. For all other unbleached pulps Östrand's $KMnO_4$ method giving the results in Roe's Cl no. furnishes a rapid method of control.
WILHELM SEGERBLOM

**The relative stabilities of rag and purified sulfite pulps.** HARRY F. LEWIS. *Paper Trade J.* 95, No. 21, 29–42(1932).—A report and discussion of the results obtained to date in an investigation of the chem. stabilities of selected rag, alpha and super-alpha pulps toward heat, acids, alkalies and light. Conclusions: If cellulose is considered as a polymerized body composed of anhydroglucose units, the rag pulps studied are richer in cellulose than are alpha pulps; the latter contain approx. 5% of pentosan material, at least half of which has been isolated as xylan; rag pulps contain less than 0.7% pentosan material. The $\alpha$-cellulose of No. 1 muslin stock is appreciably more resistant to the repeated peptizing action of cold 17.5% NaOH than is the $\alpha$-cellulose of super-alpha pulp, this indicating for these 2 pulps a considerable difference in colloidal structure, in favor of the rag stock. Rag pulps are more resistant to degradation by heat, alk. solns., acid solns. and light, than are the alpha pulps. Light from the C arc of the Fadeometer causes the alpha pulps to lose their viscosities at a faster rate than the rag stocks. Viscosity-time curves of the alpha pulps, based upon changes in the Fadeometer, cut across similar curves of the rag stocks of lower original viscosities. The colloidal structure of the alpha pulps, therefore, is more readily altered by the action of light than is that of the rag pulps. The viscosity of rag stock from new unbleached muslin is greater than that of the other stocks; this pulp may therefore be degraded for long periods of time by the various reagents and at the same time retain more desirable strength characteristics than are possessed by the other stocks before degradation.
A. PAPINEAU-COUTURE

**Results of the Naumann-Schopper bending test as compared with those of the Mullen test.** J. RIBIÈRE-RAVERLAT. *Papier* 35, 1055–6(1932).—A comparison of the results obtained on 2 different boards indicates that there is a relationship between the results obtained by the 2 instruments, but that its precise detn. requires more extended tests. Although the Mullen does not permit of distinguishing between machine and cross directions, it gives a good discrimination between the 2 sides of the test piece, and, for a given set of samples, it gives characteristic results which are in all points comparable to those of the bending tester. It presents the same drawback of slippage between the jaws, but it is much simpler and quicker to operate.
A. PAPINEAU-COUTURE

**Direct-heated-digester operation control.** M. B. HALL. *Paper Trade J.* 95, No. 15, 31–2(1932).—The development of sulfite-resistant alloy steels has permitted the practical realization of automatic steam input and relief control according to the Allen patents. Installations are cited.
A. PAPINEAU-COUTURE

**Acid penetration in sulfite pulping.** RALPH B. HANSEN AND SVARRE HAZELQUIST. *Paper Trade J.* 95, No. 20, 27–9(1932).—Penetration is not a deciding factor in the handling of sulfite digesters, as it is nearly impossible to bring a com. digester of any size to 110° before penetration of the chips is complete, unless initial acid temp. is under 35°. It is not necessarily true that complete penetration has not taken place because a large amt. of "brown" chips are present at the end of the cook. These may have been caused by not having enough combined $SO_2$ present, by local overheating, etc. If local overheating has been great enough, it is possible that chips be "browned" even though the penetration has been thorough. In general, increase in acid temp. increases the rate of penetration; increase in free $SO_2$ increases the rate of penetration of free $SO_2$ to an even greater extent, and somewhat increases the penetration of combined $SO_2$. Pressure above that necessary to hold the gas in soln. has very little effect on penetra-

tion. Penetration is a straight-line function of the time. A moisture content of 30–40% is the most favorable for a quick and thorough penetration. A. P.-C.

**Sulfite cooking with forced circulation and external heating.** B. SKOGSTROM. *Pappers-Trävaru-Tidskr. Finland* **2**, 66–76(1932); *Chimie & industrie* **28**, 1425.—A description and discussion of the Brobeck indirect, external-heating system for sulfite cooking. A. PAPINEAU-COUTURE

**Regeneration of sulfurous acid and heat in sulfite cooking.** O. K. GILLER. *Bumazhnaya Prom.* **11**, No. 11, 37–41(1932).—A discussion. CHAS. BLANC

**The elimination of pitch trouble.** O. BRAUNS. *Pulp Paper Can.* **33**, 333–6, 383–8(1932).—Extensive investigation carried out both in the lab. and in the mill on the causes and elimination of pitch troubles in sulfite pulp and paper mills shows that no appreciable relief can be expected from seasoning of the wood or from altering cooking conditions. A process consisting in properly adjusted addns. of sulfite waste liquor and alum to the slush stock was developed and is being successfully applied in one of the Abitibi mills in eliminating pitch troubles. Theories are advanced to explain the causes of pitch troubles and the mechanism of the process devised for eliminating them. A. PAPINEAU-COUTURE

**The present state of the waste-water problem in pulp and paper mills.** A. PRITZKOW. *Zellstoff u. Papier* **13**, 60–2(1932).—A brief review of the work done in the last decade toward solving this problem. S. I. ARONOVSKY

**Selective disintegration of pulp for thin grades of paper.** S. S. KHARZ. *Bumazhnaya Prom.* **11**, No. 11, 51–5(1932).—The foreign factory practice is discussed. CHAS. BLANC

**Production of sulfur in Texas.** GOSTA HALL. *Svensk Pappers-Tidn.* **36**, 36–42 (1933).—Descriptive. WILHELM SEGERBLOM

**Nomographic charts in the paper industry.** D. S. DAVIS. *Paper Trade J.* **94**, No. 2, 31–3(1932).—Nomographic charts for coal cost, sp. gr for chip board, kraft production, effluent loss and Schopper-Riegler beating tester, are given and their use is explained. A. PAPINEAU-COUTURE

**United States patents on paper making. Third quarter, 1932.** CLARENCE J. WEST. *Paper Trade J.* **95**, No. 15, 40–2(1932); cf *C. A.* **26**, 5417.—A list in numerical sequence of patents relating to pulp and paper making issued at Washington in July, Aug. and Sept., 1932. A. PAPINEAU-COUTURE

**Flax and its utilization for paper making.** R. ISNARD. *Papier* **35**, 953–61(1932).—An address outlining the process used by the Etablissements Lemaire-Destombes & Cie. for the production of pulp from flax fiber that is too short to be spun. A. P.-C.

**Modern $p_H$ measurements and their significance in the paper industry.** G. GOLLNOW. *Svensk Pappers-Tidn.* **35**, 791–2(1932).—Descriptive. W. S.

**The state of electrical charge of paper.** M. UETZKIĬ. *Bumazhnaya Prom.* **11**, No. 11, 60–2(1932).—The elec. charge of paper caused by friction in the machine processing depends on the moisture content of the pulp, and is gradually lost in storing. Cigaret paper becomes recharged in the processes of casing and stuffing. C. B.

**Alum feed for paper-mill waters.** RICHARD T. BARNES, JR. *Paper Trade J.* **95**, No. 14, 25–7(1932).—A logical method of detg. and controlling the alum feed to paper-mill water for the best purification is by the $p_H$-alum curve. Such curves follow 2 general outlines, dependent on whether the water is clear and moderately hard or colored and soft. For the soft waters of New England, alkali is needed in conjunction with the alum used for purification to obtain the highest efficiency from the alum feed. A. PAPINEAU-COUTURE

**Use of white water in fine paper mills.** ANDREW JACKSON. *Paper Trade J.* **95**, No. 23, 44–6(1932).—A description of the progress made in one of the Am. Writing Paper Co.'s fine paper mills in the reuse of white water without utilization of save-alls. A. PAPINEAU-COUTURE

**White-water surveys in a fine-paper mill.** SAMUEL HELLBERG. *Paper Trade J.* 95, No. 23, 46–8(1932).—A brief outline of the surveys made at one of the Am. Writing Paper Co.'s fine-paper mills, the results that they showed and the difficulties encountered in the reuse of white water. A. PAPINEAU-COUTURE

**Technical control in a writing-paper mill.** CARL SCHNEIDER. *Paper Ind.* **14**, 668–9(1932).—A classification of control functions in mills with suggestive routine tests for standardizing mfg. processes. A. PAPINEAU-COUTURE

**New types of equipment for testing paper.** F. T. CARSON AND F. V. WORTHINGTON. *Paper Trade J.* **95**, No. 16, 34–6(1932).—A description of 3 pieces of app. developed at the U. S. Bur. of Standards in connection with the testing of paper: (1) a specially designed float used in making the dry indicator test for water-resistance, which holds the specimen flat and in a definite position; (2) an absorption tester consisting of an inclined pipet mounted on a frame and provided with a needle valve and controls so that

a very small drop of water can be reproducibly delivered onto the surface of paper in making a test for absorptiveness; (3) an improved app. for extg. and cleaning processed papers and sheet materials (it combines the solvent action obtained with a reflux condenser with a light scrubbing of the surface and is designed to recover a sheet about 10 × 12 in. without the necessity of cutting or creasing it). A. PAPINEAU-COUTURE

**Determination of water resistance of paper.** ANON. *Paper Trade J.* **95,** No. 18, 36(1932).—A description of the tentative standard method of the Tech. Assoc. of the Pulp and Paper Ind. A. PAPINEAU-COUTURE

**Determining the time of ink absorption of blotting paper.** ANON. *Paper Trade J.* **95,** No. 18, 39–40(1932).—A description of the tentative standard method of the Tech. Assoc. of the Pulp and Paper Ind. A. PAPINEAU-COUTURE

**Determination of rate of absorption of water by bibulous papers.** ANON. *Paper Trade J.* **95,** No 18, 40(1932).—A description of the tentative standard method of the Tech. Assoc. of the Pulp and Paper Ind. A. PAPINEAU-COUTURE

**Sizing characteristics of wax sizes.** O. F. NEITZKE. *Paper Trade J.* **95,** No. 18, 29–31(1932).—Lab. and mill-scale tests with bleached sulfite stock and no fillers showed that the general sizing characteristics obtained with rosin-wax size are essentially the same as those of rosin size, but are obtained with lower size consumption. Within a range of drying temps. of 70–250°F., the sizing value of the rosin-wax size used (Bennett No. 19) is greater than that of rosin size at any 1 temp. The increase in sizing value due to increased drying temp. is more pronounced and more rapid for the rosin-wax size than for the rosin size. To obtain a given ink resistance it is not necessary to dry the paper sized with rosin wax at as high a temp. as the one sized with rosin. A. PAPINEAU-COUTURE

**Rosin-wax sizes.** RAYMOND B. LADOO. *Chem. Met. Eng.* **40,** 89–90(1933).—The production and advantages of rosin-wax sizes contg. several different proportions of wax, as applied in the paper industry, are discussed. Better sizing is afforded with less material and at lower cost. Other advantages include: absence of foaming, less brittleness, and better resistance to penetration of alk. and alc. solns. Wax improves the permanency of paper and imparts a higher gloss, better printing qualities and an apparent opacity. Rosin-wax sizes are emulsions of wax in rosin soap. Water is the liquid, rosin soap the emulsifying agent and a blend of wax and rosin the emulsified material. W. H. BOYNTON

**The materials used in the manufacture of tracing paper.** HOWARD L. VINCENT. *Paper Trade J.* **95,** No. 26, 24–6(1932).—A list is given of the more important materials used by foreign and domestic manufacturers of tracing paper, showing what characteristics may be expected of the several types of tracing paper prepd. with them. A specification avoiding the present undesirable features of tracing papers is given. A. PAPINEAU-COUTURE

**Vertical stack driers without drier felts on Fourdrinier machines in the Miami Valley.** JOSEPH H. WALLACE. *Paper Trade J.* **95,** No. 17, 44–8, 72(1932).—Descriptive. A. PAPINEAU-COUTURE

**The drying of paper and felts.** REINHARD SCHULZE. *Pulp Paper Can.* **33,** 433–6, 485–7(1932).—Results are reported of exptl. runs for removal of vapor within the paper machine and for addnl. drying by means of injected hot air. Conclusions: Removal of vapor between paper and felt increases machine output and felt life. To obtain high efficiency the hot air blast must be brought into intimate contact with the paper, and especially with the felt. The kind of paper to be dried considerably affects increase in production and efficiency. The highest possible air temp. with proportionately smaller quantities of air are more economical and give higher production than large quantities of air and low temps. Blowing hot air through the felt is considerably more efficient than blowing it over the felt. Drying the felt by blowing hot air through it is preferable to drying on drying cylinders. The rate of drying of felts depends mainly on the kind of weave, porosity, felting and other mfg. characteristics, and but slightly on the material. A rapid-drying felt is likely to have a longer life than a slow-drying one. A. PAPINEAU-COUTURE

**Illustration-printing and paper quality.** JULIUS BEKK. *Zellstoff u. Papier* **12,** 399–403, 441–7, 489–93(1932); **13,** 18–22(1933); cf. *C. A.* **26,** 4717.—A discussion of the relationship between the properties and printing qualities of various grades of paper S. I. ARONOVSKY

**More about condenser paper.** I. V. TZETZERO. *Bumazhnaya Prom.* **11,** No. 11, 62(1932).—A good grade of condenser paper was obtained by treating rag waste 1 hr. with cold 0.5% anhyd. $Na_2CO_3$, and bleaching with 1% active Cl. C. B.

**Study of physical properties of binders board.** B. W. SCRIBNER AND L. W. SNYDER. *Paper Trade J.* **95,** No. 16, 29–33(1932).—A study was made of the thickness, d., wt., bursting strength, tensile breaking strength and elongation and behavior under flexural

stress of a no. of samples of com. binders board. The flexural-strength test is the most suitable single test because of its duplication of service stresses and its superior accuracy. A flexural test is described which is carried out by using a simple attachment to the ordinary tensile-strength tester. A. PAPINEAU-COUTURE

Qualitative tannin analysis. Detection of sulfite cellulose extract (GERNGROSS, HERFELD) **29.** Influence of the method of boiling and purification of sulfite cellulose extracts on their detection in vegetable tanning extracts (GERNGROSS, HERFELD) **29.** Detecting free S in viscose silk and the detection of cyanide ions in aqueous solutions (CASTIGLIONI) **7.** Acylated aromatic amines; artificial filaments (Brit. pats. 363,986, 364,040) **10.** Spinning pots and centrifuge buckets (Brit. pat. 365,963) **1.** Polymerized styrenes [for artificial masses] (Brit. pat. 365,217) **10.** Wetting, etc., agent (Brit. pat. 364,669) **18.**

SCHNEIDER, FRITZ: **Die Kupferzahlbestimmung der Cellulose.** Thesis, Darmstadt, 1930. 64 pp.

**Apparatus for drying webs of cellulose made from cellulose solutions.** CARL H. VON HOESSLE and OTTO M. SCHADE (to Chemische Fabrik von Heyden, A.-G.). U. S. 1,890,832–3, Dec. 13. Structural and mech. details.

**Cellulose derivatives.** SOC. POUR L'IND. CHIM. À BÂLE. Fr. 40,872, Oct. 14, 1931. Addn. to 678,747 (*C. A.* **24,** 3646). Esters are prepd. by treating cellulose xanthates or xanthic acids of cellulose pptd. from solns., with org. acid anhydrides in the presence of appreciable amts. of salts of weak acids

**Cellulose derivative composition.** MARTIN BANDLI. Brit. 365,526, Oct. 15, 1930. A rubbery compn. is made by dissolving cellulose acetate in a mixt. of solvents, dissolving or suspending a plasticizer therein, and pptg. the acetate and plasticizer by the addn. of a liquid, the mixed solvent being such that at least one ingredient is readily miscible and one immiscible with the pptg. liquid. Numerous examples are given.

**Cellulose esters.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,250, Nov. 19, 1929. Hydroxyalkylcellulose esters of org. acids are obtained by treating hydroxyalkylcellulose with the acid anhydride in the absence of a catalyst and a diluent and preferably at a raised temp. Among examples (1) hydroxyethylcellulose, made by treating alkali cellulose with 4–5 times its wt. of ethylene oxide in the presence of $C_6H_6$, is introduced into 10 times its wt. of $Ac_2O$ and heated 2.5 hrs. to 120°, and (2) hydroxybutylcellulose is treated with the anhydrides of coconut-oil fatty acids at 130–140°.

**Cellulose esters.** KODAK-PATHÉ. Fr. 738,433, April 13, 1932. Cellulose is acetylated in the presence of esterification agents contg. a quantity of acetyl groups not passing appreciably that necessary for complete esterification of the cellulose. Thus, 1 part of cellulose is treated with a mixt. contg. $Ac_2O$ not more than 3 and AcOH 3 parts. $H_2SO_4$, $Na_2SO_4$, AcONa or $Na_3PO_4$ may be used as catalyst.

**Cellulose ester compositions and products therefrom.** CELLULOID CORP. Brit. 363,689, June 20, 1929. Void. Cellulose acetate or other cellulose deriv. is mixed with any aromatic phosphate, *e. g.*, triphenyl or tricresyl phosphate and any ester of phthalic acid to give a compn. which may be prepd. in any desired form, *e. g.*, sheets, lacquers or films. The films may be used for the manuf. of *laminated glass, automobile curtains, lamp shades* or *photographic films.*

**Cellulose ethers.** ASRIEL LIEBSTER. Brit. 364,463, May 16, 1930. A highly etherified cellulose, *e. g.*, with an Et content up to 50%, is produced in a single-stage reaction between cellulose, a dry alkali hydroxide, an indifferent org. liquid and an ester of an inorg. acid, the reaction being carried out in the absence of $H_2O$. In an example cotton is treated in an autoclave with finely divided NaOH, Et chloride and petroleum. The product, sepd. by diluting with benzine, centrifuging and washing with $H_2O$, is sol. in $C_6H_6$, alc. and glacial AcOH and gives rise to films of good flexibility and transparency.

**Cellulose ether compositions.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 363,333, June 12, 1929. Void. Water-resistant compns. are produced by incorporating with a cellulose ether a non-solvent softener, *e. g.*, petroleum jelly, with or without the addn. of a solvent softener compatible therewith, *e. g.*, dibutylphthalate, benzophenone. A volatile solvent, *e. g.*, $C_6H_6$, AcOEt, EtOH, may also be added. The ratio of non-solvent to solvent softener is greater than 50:50 while 0.4–4 parts of composite

softener is employed for 10 parts cellulose ether. The *products serve as plastics, varnishes, waterproofing compns.*, etc.

**Benzyl cellulose.** IMPERIAL CHEMICAL INDUSTRIES, LTD., ALFRED S. LEVESLEY and FREDERICK CHARLES RANDALL. Brit. 364,142, Sept. 19, 1930. A step in the purification of benzyl cellulose comprises incorporating with the crude substance a water-sol. wetting agent of the high-mol. sulfonic acid or sulfonated-oil type. This treatment may be followed by washing with $H_2O$ and, if desired, an org. solvent which has no coagulating and little or no swelling action on the cellulose ether. Among examples benzyl cellulose is incorporated with Turkey-red oil and the mixt. stirred with water. The product is washed with a mixt. contg. toluene and white spirits.

**Cellulose acetates.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,110, July 9, 1929. Void. See Fr. 698,392 (*C. A.* **25**, 3167).

**Cellulose acetate.** CARL J. MALM and ARNE ANDERSEN (to Kodak Limited). Brit. 364,794, Dec. 16, 1929. Cellulose acetate of low viscosity and good strength is prepd. by pretreating the cellulose with AcOH and a catalyst at 100°F., then adding acetic anhydride and raising the temp. to 120–130°F. until acetylation is substantially complete and then lowering the temp. to about 100°F. and maintaining this temp. until the dope is free from grain. Cf. *C. A.* **26**, 5419.

**Cellulose acetate sheet material.** ERNEST G. GREVILLE. Brit. 364,716, Oct. 22, 1930. A sheet of cellulose acetate capable of being softened for molding or shaping is so incised that in the softened condition its capacity for expansion and extension enables it to follow the contour of the object over which it is molded without destroying its properties as a support on resuming the hardened condition.

**Water-soluble compounds of cellulose-xantho-fatty acids.** LEON LILIENFELD U. S. 1,890,393, Dec. 6. A cellulose-xantho-fatty acid such as cellulose-xantho-acetic acid is treated, in the presence of water, with an aromatic amine in which a hydrocarbon radical is connected with the N of the amine, such as $MeNH_2$ to obtain a water-sol product which dries to an insol. condition.

**Nitrocellulose solns. of low viscosity.** HAMMERMILL PAPER CO. Brit. 363,648, June 19, 1930. See U. S. 1,768,253 (*C. A.* **24**, 4391).

**Saccharification of cellulose.** HEINRICH SCHOLLER. U. S. 1,890,304, Dec 6 Cellulosic material is subjected to pressure to reduce the interstices in the material, and dil. acid is percolated through the compressed material while it is still under pressure, the sugar soln. formed is continuously and rapidly removed from the system (in a described app.), and the temp. of the emerging sugar soln. is reduced to prevent de compn. Cf. *C. A.* **26**, 302.

**Carbohydrates.** LONZA ELEKTRIZITÄTSWERKE UND CHEMISCHE FABRIKEN A G Brit. 368,078, Mar. 17, 1930. See Fr. 714,488 (*C. A.* **26**, 1782).

**Viscose threads.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,081, Aug. 13, 1929. Void. To facilitate the spinning of viscose threads the viscosity of the spinning soln. is reduced by raising the temp. thereof shortly before it leaves the nozzle, *e. g.*, by employing a heated coagulation bath.

**Apparatus for drying strips, films or sheets of materials such as "regenerated viscose."** ERNST BLEIBLER (to Sylvania Industrial Corp.). U. S. 1,890,568, Dec. 13. Structural and mech. features.

**Viscose rayon.** ALGEMEENE KUNSTZIJDE UNIE, N. V. Brit. 363,908, Mar 8, 1930. Rayon is produced from viscose which is clarified by the addn. at any stage of the production of the viscose of a small amt., *i. e.*, less than 2%, of a sulfonated fatty acid, fat or fatty oil having a high content of organically bound $H_2SO_4$, the non-sulfonated fat, etc., in the sulfonated product being so small that it shows no turbidity with an excess of lye.

**Rayon from viscose.** GLANZSTOFF-COURTAULDS G. M. B. H. Brit. 363,441, Oct 3, 1930. Rayon of improved tensile strength is produced from viscose to which has been added cholic acid or a bile acid deriv. thereof. Salts or condensation products or mixts. of such acids as are obtained by the treatment of bile may be used.

**Rayon.** C. F. BOEHRINGER & SOEHNE, G. M. B. H. Brit. 363,700, Aug. 14, 1930. For the manuf. of *rayon, films, plastic masses, varnishes*, etc., there is used primary triacetyl cellulose made by acetylation processes in which the fibrous structure of the cellulose is preserved and in which the catalyst is a halogen, halogen hydride acid, perhalogen acid or salt of such acid other than an alkali salt except in the presence of a suitable acid, or a halogen fatty acid. The use of $H_2SO_4$ and other catalysts introducing residues leading to decompn. of the acetylated cellulose is avoided; acetates are obtained workable into products of keeping qualities equal to those from acetone-sol. secondary acetates and superior thereto in strength and resistance to water.

**Rayon.** JACQUES DELPECH and CONSTANTIN HEINRICH. Brit. 364,438, July 5, 1930. See Fr. 698,423 (*C. A.* **25**, 3168).

**Rayon.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,982, July 28, 1930. Artificial threads are obtained from solns. contg. cellulose xanthate and a xanthate of a $H_2O$-insol. higher alc., alc.-acid or ester thereof, or of a partially substituted $H_2O$-insol. deriv. of a substance of the polyvinyl alc. type. They have improved softness and suppleness with increased resistance to water.

**Rayon.** VEREINIGTE GLANZSTOFF-FABRIKEN A.-G. Fr. 737,640, May 26, 1932. Rayon spun on bobbins or cylinders is washed and dried and twisted directly from these bobbins or after rewinding on an intermediate bobbin and, in the absence of an open frame in the form of a honeycomb, is rewound on a movable support, after which the support is withdrawn and the thread is submitted to the usual treatments such as desulfuration, decoloration, deacidification, etc., without any interior stiffening means. Fr. 737,641. Rayon from the spinning nozzles is wound on bobbins without submitting it to torsion and is then twisted in a chamber contg. rarefied air. Cf. *C. A.* **27**, 1171.

**Rayon.** JACQUES DELPECH. Fr. 737,955, Sept. 26, 1931. Nitrocellulose collodion is dissolved in MeOH and spun into a coagulating bath which has as a basis an aq. soln. of MeOH and which contains one or more hygroscopic substances such as glycerol, $CaCl_2$, $ZnCl_2$ or $NH_4NO_3$. The hanks of silk can then be allowed to ripen in air before denitration without danger of the explosive state being reached.

**Rayon, etc.** LEON LILIENFELD. Fr. 40,432, Mar. 14, 1931. Addn. to 701,280 (*C. A.* **25**, 3833). The products obtained by etherifying or esterifying viscose by agents which will react (other than halogen derivs. of bi- or poly-hydric alcs., halogenated fatty acids and esters of trithiocarbonic acid) are used for making rayon, etc. Examples of agents used are halogenated olefins, di- or poly-halogen paraffins, inorg. esters of monohydric alcs., halogen derivs. of ethers of monohydric alcs., aldehydes or ketones, inorg. or org. esters or cyclic ethers of di- or poly-hydric alcs., halogenated alkyl- or aralkyl-amines, acid halides such as BzCl, hydrocarbon sulfochlorides, quinoline sulfochloride, halogen derivs. of $PhNO_2$ or aromatic acids, diazonium salts, etc. Fr. 40,438, May 27, 1931. Rayon, etc., is made from products obtained by bringing a cellulose deriv. contg. one or more CSS groups into contact with agents capable of introducing one or more radicals, using a cellulose xanthate poor in or practically free from water.

**Rayon filaments, threads, etc.** BRITISH CELANESE, LTD., HENRY DREYFUS and WM. I. TAYLOR. Brit. 364,654, Sept. 9, 1930. In the manuf. of artificial filaments, etc, by extrusion from a nozzle into an evaporative atm. contained in a cell or chamber the nozzle is surrounded by a shield adapted to seclude the filaments in the early stages of their formation, this retarding evapn. and giving filaments of fine deniers but high strength.

**Fining and improving rayon, etc.** HANS SUTER. Brit. 363,929, April 30, 1930. When fining and improving rayon, etc., composed of cellulose derivs., especially cellulose acetate, by processes involving treatment with swelling baths contg. halogenated hydrocarbons and stretching of the swollen threads, deleterious effects, such as may occur after extended use of the bath, are avoided by the addn. of small quantities of unsatd. org. compds., *e. g.*, butylene, olein, olive oil, linseed oil and linoleic acid, to the bath.

**Spinning rayon.** GLANZSTOFF-COURTAULDS GES. Brit. 363,505, Dec. 15, 1930. In the wet spinning of rayon each thread is passed through a trough arranged in the spinning bath over a part of its travel through the bath so that individual filaments that have become loosened are carried back to their own thread.

**Treating rayon.** VEREINIGTE GLANZSTOFF-FABRIKEN A.-G. Brit. 363,932, April 15, 1930. Freshly spun rayon, particularly cuprammonium silk, is wound on light tubes which are deformable but which during spinning, etc., are provided with internal supporting members. The wound silk is washed, after-treated and, if desired, dried and, after removal of the supporting members but while still on the tubes, is supplied for direct further working up, with or without twisting. The tubes may be made of parchment, press or impregnated paper, thin Al sheet, etc.

**Treating rayon.** BRITISH BEMBERG, LTD. Brit. 363,958, June 13, 1930. Addn. to 312,034 (*C. A.* **24**, 976). The process of 312,034 is modified by unwinding the untwisted rayon from the unlaced cross-wound skeins while still moist from the liquid treatments and simultaneously twisting, drying being effected on the wound and twisted yarn. The moist skeins are mounted on swifts and the yarn is wound directly from the skeins on to cop bobbins while it is being twisted by ring-twisting frames.

**Treating rayon.** VEREINIGTE GLANZSTOFF-FABRIKEN A.-G. Brit. 365,436, April 19, 1930. Freshly spun rayon is wound onto perforated tubes in the form of a cop winding and is then treated on these tubes with washing, desulfurizing, bleaching, decoppering, acidifying or scrooping liquids passed by suction through the thread layers.

**Machines for spinning rayon.** VEREINIGTE GLANZSTOFF-FABRIKEN A.-G. Brit.

363,529, Jan. 20, 1931; 363,556, Feb. 24, 1931 (addn. to 363,529); 363,566, Mar. 10, 1931 (addn. to 363,529).

**Apparatus for stretch-spinning rayon.** BRITISH BEMBERG, LTD. Brit. 365,502, Sept. 10, 1930.

**Purifying solutions used in the rayon industry.** VEREINIGTE GLANZSTOFF-FABRIKEN A.-G. Brit. 363,213, Feb. 10, 1930. Viscous solns., such as cuprammonium cellulose soln. or viscose, are filtered through linters, wood pulp or mixts. of these, brought into a flat or plate form without the use of adhesives and inserted into filter presses, flat filters or candles.

**Artificial threads.** THOMAS F. BANIGAN (to Comptoir des textiles artificiels, Société anonyme). Brit. 363,692, Dec. 5, 1929. Void. In applying stretch to artificial thread by methods involving the passage of the thread one or more times around a wheel, the thread is displaced laterally on the wheel by a guide comprising a smooth roller, preferably tapered.

**Artificial filaments and films.** GIULIO TOCCO. Brit. 365,484, July 3, 1930. A soln. of a cellulose deriv. or like material is dry-spun into a vacuum chamber, the product being led therefrom through a liquid column of sufficient height to balance the pressure difference between the chamber and the outer atm. App. is described.

**Sieve and outlet pipe for cellulose digesters.** TORSTEN SAMSON (to Aktiebolaget Nordiska Armaturfabrikerna). U. S. 1,889,731, Nov 29.

**Bleached pulp for paper making.** HORATIO A. HELDER (to Champion Fibre Co.). U. S. 1,890,179, Dec. 6. Pulp obtained by the digestion of raw fibrous material such as wood is refined and hydrated substantially to the condition suitable, except for color, for use directly in a paper web-forming operation, and the pulp is then bleached

**Centrifugal apparatus for purifying paper pulp, crude starch, etc.** GUSTAV TER MEER. Fr. 737,810, May 30, 1932.

**Centrifugal separator, particularly for paper pulp.** TANDY A. BRYSON. Brit. 367,301, Aug. 26, 1930.

**Pulp-grinding machine.** BRIT. THOMSON-HOUSTON CO., LTD. (to H R. Crago). Brit. 380,014, April 17, 1931. Mech. features.

**Wood rasper or grinder.** "MIAG" MUHLENBAU UND INDUSTRIE A.-G. Brit. 363,361, Sept. 12, 1929.

**Filter for recovering fibers from washing water in paper making.** MARCEL THIRY Fr. 737,811, May 30, 1932.

**Apparatus for cleansing the felts of paper-making machines.** JOHN L. HARRIS Brit. 363,318, Sept. 5, 1930.

**Jordan engine.** EMIL A. PETERSON (to Valley Iron Works). U. S 1,890,622, Dec. 13. Mech. features.

**Apparatus for rectifying and regulating paper stock.** HAROLD D WELLS. U. S. 1,890,799, Dec. 13. Structural and mech. features.

**Flow rectifier for paper stock.** MAX WENZEL. U S 1,890,634, Dec 13. Mech features.

**Impregnating paper for producing a product of good flexibility.** FRANK G. CRANE U. S. 1,889,851, Dec 6. Paper is impregnated with a soln. contg. a substantial proportion of Na silicate, soap and glycerol and subsequently is treated (as by oxalic acid or Al sulfate) to convert a substantial portion of the Na silicate into reaction products and is dried.

**Coating process.** HENDRIK J. PRINS. Brit. 365,466, May 27, 1931. Paper and paper articles, *e. g.*, containers and bottles, are treated with an emulsion or latex of rubber, gutta percha or balata and then with a wax-like substance, either molten or in soln., to form a waterproof layer thereon. The paper is then heated to or exceeding the m. p of the wax which dissolves in the rubber layer forming an elastic non-tacky and impervious coating.

**Producing effects on papers, cardboard, floor-coverings, etc.** CARL DANKERT (to I. G. Farbenind. A.-G.). U. S. 1,889,953, Dec. 6. See Ger. 567,238 (*C. A.* 27, 1511).

**Laminar products.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 737,718, May 27, 1932. Resinous compns. are incorporated in paper pulp while it is still wet, and the mixt. is made into thick sheets by the usual machines, dried and molded under heat and pressure.

**Sizing composition.** GEORGE J. MANSON. Brit. 363,372, June 6, 1930. A non-fouling sizing material for paper or wood pulp contains particles of waterproofing materials, *e. g.*, paraffin wax, mineral oil, pitch, which have been encysted by a ppt. formed, *e. g.*, by the reaction between a soln. of Na silicate, etc., and a pptg. agent such as alum, hydrated CaO, HCl, etc., or zeolitic substances which form insol. hydrated silicates or mixts. of silicate and silicic acid. A protective colloid, *e. g.*, glue or casein, may form an

ingredient of the compn. Among examples wax is melted and formed into an emulsion with Na silicate soln., alum is added and after further agitation the compn. is added to the paper pulp.

**Sizing fibrous material for fiber board.** GEORGE F. DAVIS. U. S. 1,889,642, Nov. 29. Dry bulk fiber is suspended in a gaseous medium such as air, and a sizing agent such as a rosin size is sprayed onto the material while it is thus suspended; aq. stock is formed from the sized fibers and they may be used for making products such as fiber board for shoe heels, etc. App. is described.

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE AND C. G. STORM

**Determination of the stability of smokeless powder from the volume of the gases of decomposition at constant pressure and temperature.** I. v. MEERSCHEIDT-HÜLLESSEM. *Z. ges. Schiess-Sprengstoffw.* **28,** 6–8(1933).—A method and app. are described for detg. the vol. of gaseous decompn. products, including moisture, generated from a 5 g. sample of powder heated at a const temp of 120° and atm. pressure. The sample is contained in a test tube inclosed within a stoppered flask which contains paraffin surrounding the tube, the entire app being heated in a thermostat. Liberation of decompn. products displaces molten paraffin through a side tube from the flask into a weighing beaker, and the vol. of these products is calcd. from the wt of the paraffin and its sp. gr Observations are made at 15 min. intervals over a period of 5 hrs. A tabulation and curves show the results obtained with 2 types of powders. C G S.

**The barium chloride reaction of ignition residue of black powder.** IVAN MOSKOV. *Deut. Z. ges. gericht Med.* **20,** 86–8(1932) $BaCl_2$ gives accurate results even 24 hrs. after ignition, contrary to dissenting statements FRANCES KRASNOW

**Explosiveness of saturated alcohol vapor-air mixtures.** K. FRICKE. *Angew. Chem.* **46,** 87–90(1933). Results are presented graphically and an app. is described for testing of alc.-water mixts. 5 references. KARL KAMMERMEYER

**The critical ignition of explosive hydrogen mixtures.** J. H. MAAS AND CHARLES LEWING. *J. Phys. Chem* **37,** 13–15(1932).—The discontinuities observed in a plot of the energy necessary for spark ignition against the compn. of H-air mixts (cf. Thornton, *C. A.* **9,** 525) are not found with H-O and H-O-A mixts. H. A. BEATTY

**New methods for the manufacture of nitroglycerin.** A. FOULON. *Z. ges. Schiess-Sprengstoffw* **28,** 8–11(1933). A discussion of recent patents covering methods for sepn of nitroglycerin from spent nitrating acids. C G STORM

**Rates of detonation in carbon monoxide-oxygen mixtures.** COLIN CAMPBELL, CLIFFORD WHITWORTH AND DONALD W. WOODHEAD. *J. Chem. Soc.* **1933,** 59–62; *C. A.* **26,** 2015. As initiators, the mixts. $2H_2 + O_2$, $CH_4 + 6O_2$, and $C_2H_2 + O_2$ were taken. The detonation velocity in any given mixt was independent of the initiator employed, and was the same whether dry or moist mixts. were studied. Tubes of 1.5 ± 0.05 cm. were used. The velocity-compn curve shows an almost linear increase in velocity from 1710 m./sec for the mixt contg 50% CO to 1770 m./sec. for that contg. 80% CO. The curve is smooth and shows a rounded max. between 75 and 80% CO. In repeating the work of Bone and Fraser (*C. A.* **25,** 3171), who found a pronounced max. at 75% CO, a detonating box and 12.5 mm tubes (as used by B and F.) were employed, but results agreeing satisfactorily with those obtained with the larger tubes, and giving the same rounded max. on the velocity-compn. curve were obtained. Conclusion: As with H–O mixts., the velocity of detonation in CO–O mixts. is detd. mainly by the calorific value and d. of the mixt. EDWARD B. SANIGAR

**Gaseous combustion in industry.** R. V. WHEELER. *Heat Treating and Forging, Insert "Furnaces"* **18,** 487–8(1932). A general paper dealing with flame propagation and the calcn. of flame speeds in gaseous mixts. J. BALOZIAN

**Spontaneous combustion or ignition of hay.** F. ROBERTSON DODD. *Analyst* **58,** 77–80(1933).—Valuable suggestions are given to aid the expert in detg. whether a hay-stack fire is due to spontaneous combustion or not. W. T. H.

**The preparation and properties of burning, illuminating and detonating compositions employed in pyrotechnics, signals, etc., and the loading of such compositions in fireworks.** F. LENZE. *Z. ges. Schiess-Sprengstoffw.* **27,** 325–8, 366–71, 406–9(1932); **28,** 14–17(1933).—The construction of various kinds of fireworks is described and the nature and prepn. of compns. used are discussed. Tabulations show results of detns. of ignition temp., sensitiveness to impact and friction, explosive characteristics, etc., of these compns. C. G. STORM

**Alloys for detonating caps** (Brit. pat. 363,671) **9.**

BESTMANN, THEODORE: **Der Einfluss des Druckes und der Vorwärmungstemperatur auf die Entzündungsgeschwindigkeit explosibler Benzin- und Benzol-Luftgemische.** Thesis, Brunswick, 1930. 65 pp.

**Explosives.** MANUFACTURE GÉNÉRALE DE MUNITIONS. Fr. 737,561, Sept. 17, 1931. Priming or fulminating compns. contain a nitrate of Tl, Cr or other rare metal instead of $KNO_3$ or $KClO_3$.

**"Double base" explosive powders.** WM. E. WAGNER (to Western Cartridge Co.). U. S. 1,890,241, Dec. 6. Finely divided cellulose is treated with a nitrating agent such as $HNO_3$ and $H_2SO_4$, nitroglycerin is mixed with the nitrated cellulose in the presence of the nitrating agent, and the composite product may be formed into sheets, strings or grains. Cf. *C. A.* **26**, 4176.

**Mercury fulminate.** JOSEF MEISSNER. Brit. 363,661, Sept. 25, 1929. See Fr. 702,414 (*C. A.* **25**, 4405).

**Igniter charge for blasting caps.** LLOYD H. FISHER (to Hercules Powder Co.). U. S. 1,890,112, Dec. 6. A ferricyanide such as $K_3FeC_6N_6$ 20–40 is used with an oxidizing agent such as $KClO_3$ 10–30 and a nitrated carbohydrate such as nitrocellulose 70–30%.

**Apparatus [with a heated filament] for detecting the presence of combustible gases in oxygen-containing gases such as air in mines.** ALBERT N. ERICKSON (to Union Carbide Co.). U. S. 1,889,890, Dec. 6. Light emitted by the filament is projected on a screen and light of variable intensity is projected on a screen adjacent for the purpose of comparison. Cf. *C. A.* **27**, 604.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**Interesting sources of natural dyestuffs.** C. D. MELL. *Textile Colorist* **55**, 117–19, 128(1933); cf. *C. A.* **26**, 6141.—Two species of myrtles, *Myrica gale* and *Myrica nagi*, are cited as sources of yellow dyes and tannin; *Calluna vulgaris*, a species of ling, for yellow dye; and the berries of the common bryony plant, *Bryonia dioica*, for purple dye. RUBY K. WORNER

**Dyes derived from acenaphthenequinone. III. Azine and indigoid vat dyes.** SISIR K. GUHA. *J. Indian Chem. Soc.* **9**, 423–7(1932).—The study embodies the prepn of acenaphthophenazines contg. the chromophoric $NO_2$ group in the benzo ring of the mol., and a study of their properties. The azines obtained are *9-nitro-*, *3-chloro-9-nitro-*, *3-bromo-9-nitro-* and *3,4,9-trinitro-acenaphthophenazines*. The first 3 compds dye wool a shade of lemon yellow and the last named produces a deep yellow shade from an acid bath when freshly pptd. by $H_2O$ from strong $H_2SO_4$ soln. Reduction of the corresponding compd. gave *9-aminoacenophthophenazine*, which dyes wool a bright yellow from an acid bath and is fast to acid and alkali but not to light. Finally the *3-chloro*, *3-bromo*, and *3,4-dinitro derivs.* of *2-thionaphtheneacenaphthyleneindigo* were prepd. These compds give red shades that are even and fast. H. W. LEAHY

**Nitro dyestuff from aminophenolsulfonic acid and dinitrochlorobenzene.** V. G. GULINOV. *Ukrain. Khem. Zhur.* **7**, No. 1, Sci.-Tech. pt., 5–8(1932); cf. *C. A.* **25**, 3636.—*p*-Aminophenol-2-sulfonic acid condensed with $C_6H_3(NO_2)_2Cl$ produced $HOC_6H_3(SO_3Na)NHC_6H_3(NO_2)_2$, which dyes wool in an acid bath a golden brown with fair fastness to light and washing. CHAS. BLANC

**A nitro dyestuff from *m*-phenylenediaminesulfonic acid and dinitrochlorobenzene.** V. G. GULINOV AND V. L. BUNITZKIĬ. *Ukrain. Khem. Zhur.* **7**, No. 1, Sci.-Tech. pt., 9–16(1932).—The initial product 1,3,4-$C_6H_3(NH_2)_2SO_3Na$ (I) was obtained by refluxing about 2 hrs. a mixt. of 110 g. cryst. $Na_2SO_3$ and 40 g. $NaHSO_3$ in 700 cc. $H_2O$ with 16.8 g. $C_6H_4(NO_2)_2$: $C_6H_4(NO_2)_2 + 5\ Na_2SO_3 + NaHSO_3 + H_2O = I + 5\ Na_2SO_4$. Because only 25% of the 70% yield of I could be crystd. out, and all usual methods for sepn. of I proved impractical, the entire reaction mass was acidified to Congo paper, the mixt. was boiled to expel $SO_2$, I was detd. by titration with $NaNO_2$, the calcd amts. of $C_6H_3(NO_2)_2Cl$ (II) (2 mols. of II to 1 mol. of I) and AcONa to neutralized HCl were added, the whole was refluxed until the last drops of II had completely disappeared, and recrystd. from $H_2O$: $I + II = 2\ HCl + (NO_2)_2C_6H_3NHC_6H_3(SO_3Na)NHC_6H_3(NO_2)_2$. It dyes wool golden brown in 4% acid bath with fair fastness to light and washing. Analogous dye was prepd. when a mixt. of 18.1 g. HCl salt of *m*-$C_6H_4(NH_2)_2$, 40.5 g. II, 68 g. cryst. AcONa and 200 cc. 90% alc. was refluxed 6 hrs. in a water bath, the dye filtered off hot, washed with a little alc., dried, dissolved in 6 pts. by wt. in $H_2SO_4$, slowly heated to 60° until completely sol. in dil. $Na_2CO_3$, then poured into iced water, salted out, filtered, washed with salt soln., dissolved in the calcd. amt. of

$Na_2CO_3$ and salted out. It gives less bright dyeings than the above dye with fair fastness to light and washing. CHAS. BLANC

**Acid dyestuffs on piece goods.** DOUGLAS KERMODE. *Dyer* **68**, 623–4(1932).—The following dyestuffs used on wool are briefly discussed: Naphthol Yellow S; Indian Yellows and Citronines; Tartrazine; Orange II; Indigo Extract and Indigo Carmine; Wool Green S; Patent Blue A types; Acid Reds of the 2G and 6B types; and Acid Brown combinations. RUBY K. WORNER

**Sulfur colors in printing on cotton.** B.-J. CHESHIRE. *Bull. soc. ind. Mulhouse* **98**, 555–7(1932)(Sealed note of 1910). **Report.** G. TAGLIANI. *Ibid* 557–8.—To avoid corrosion of the Cu app. by alk. sulfides, it is proposed to use $Na_2S$ in the form of a compd. with HCHO, which decomposes during the subsequent steaming. Mix 2 kg. 40% formol with 1 kg. of bisulfite of 36° Bé. Cool to 5°, slowly add 1 kg. calcined $Na_2S$ (65%). T. reports that the method appears to be new and successful. Cryst. $Na_2S$ is not satisfactory. I. H ODELL

**Production of black and gray under sulfur colors by means of nitrosodimethylaniline.** L. GOUBYRIN. *Bull. Soc. Ind. Mulhouse* **98**, 559–61(1932) (Sealed note of 1910). **Report.** ARTHUR LAUTER. *Ibid* 561.—$ONC_6H_4NMe_2$ is printed with resorcinol on white mercerized cotton, and after steaming for 5 min., the cloth is foularded with a soln. of sulfur colors. Grays of different intensity are obtained by adding $ZnCl_2$ colors and reducing the amt. of $ONC_6H_4NMe_2$. The dyeings are fast to washing. L. reports that the process is new and successful. I. H. ODELL

**The use of Katanol W in two-bath union-dyeing.** DOUGLAS KERMODE. *Dyer* **69**, 129–31(1933).—Practical. R. K. WORNER

**The use of indanthrene dyes to detect linseed oil in rayon.** GIUSEPPE ANTONELLI. *Tinctoria* **31**, 493(1932).—Several unreduced indanthrene dyes act as substantive dyes on rayon in the presence of linseed oil. This reaction can be used to show whether the textiles were perfectly degummed or traces of oil remain on the tissue. By dyeing the samples with Brilliant Rosa R, Scarlett GG, Brown G or GG, Red-violet RH, the rayon contg. linseed oil is dyed and the raw rayon is not G. A. BRAVO

**Indigo on wool.** H. JACKSON. *Textile Manufacturer* **57**, 410–11, 452–4(1931); cf. *C. A.* **26**, 309.—A discussion of the $HNO_3$ spot test for indigo-dyed goods and the effect of various topping colors on this test, the effect of the addn. of certain colors on the change of shade in artificial light, the estn. of indigo, the properties of indigo white and its affinity for and application to wool, the various reducing agents and different types of vats used, etc. CHAS. E. MULLIN

**The scouring of worsted piece goods with special relation to indigo dyeing.** H. JACKSON. *Textile Manufacturer* **58**, 192–3(1932).—The oiling and scouring of worsted goods for indigo dyeing are discussed, as well as the dyeing and finishing CHAS. E. MULLIN

**Exact matching of colors.** NOEL D. WHITE. *Textile Colorist* **54**, 845–6, 850 (1932).—The value of detg. the absorption spectra of dyestuffs is discussed. RUBY K. WORNER

**Recent investigations on substantive dyeing of cellulose fibers.** W. WELTZIEN AND K SCHULTZE. *Kolloid-Z.* **62**, 46–54(1933); cf. *C. A.* **24**, 5161–2, 6021; **25**, 819.—The concn. of salt and the temp. required to reach max. dye absorption increase with unevenness of dyeing; even dyeing usually shows the max. in the range 50–70°. Electrolyte-free $H_2O$ removes 90% of the dye in a few washings; the red and yellow even dyes are easier to remove than the blue from viscose. Electrolytes in low concn. decrease the rate of removal by washing. The substantive dyeing process is more complicated than is generally supposed. ARTHUR FLEISCHER

**Dyeing textiles for weight-reducing girdles and corsets.** GEORGE RICE. *Textile Colorist* **55**, 126–7(1933) RUBY K WORNER

**Dyeing wool for the heather drape suitings.** GEORGE RICE. *Textile Colorist* **55**, 120, 128(1933). RUBY K. WORNER

**Treatment with silicate and dyeing of loaded silk fabrics.** J. BRUYAS. *Russa* 7, 1157–61(1932).—The purpose of silicate treatment is to obtain more even dyeing of loaded silk. In a neutral bath at 50° it is useless to use more than 20 cc. of 30° Bé. silicate per l., the rate of increase in wt. above this concn. being much slower than the increase in reagent. Higher yields are obtained at 70–5° than at 50–60° or at 75°. Increase in alky. (by addn. of $NH_4OH$) decreases the yield. No appreciable difference in yield or in evenness of dyeing is noticeable in the presence or absence of wetting agents (sulfonated fatty alcs.). Practical operating hints are given on the dyeing of silicate-treated silk. A. PAPINEAU-COUTURE

**Note on the dyeing of Prussian blues on cotton cloth.** ED. JUSTIN-MUELLER. *Bull. Soc. Ind. Rouen* **60**, 276–9(1932).—Good blue dyeings are obtained on cotton by the addn. of $NH_4Cl$ to the ferricyanide-ferric salt bath before heat-treatment. $NH_3$

is believed to reduce ferricyanide to ferrocyanide, which then ppts. as Prussian blue. Previous processes using other reducing agents are reviewed. I. H. ODELL

**Printing and bleaching rayon and construction of leno weave piece goods.** A. C. ESTEY. *Textile Colorist* **55**, 49–52, 101–3, 130(1933). RUBY K. WORNER

**Notes on the history of bleaching, dyeing and printing of fabrics.** A. BLEY. *Tiba* **10**, 933–9, 1005–13(1932); **11**, 25–31(1933). A. PAPINEAU-COUTURE

**Tar and creosote in the dyehouse.** C. GROSVENOR. *Dyer* **68**, 669–70(1932).—The use of these materials for protecting woodwork and waterproofing walls and roofs is described. RUBY K. WORNER

**False economies in production of vat-dyed cotton-piece goods.** D. L. WILLASTON. *Dyer* **68**, 507–8, 559–60(1932).—Practical. RUBY K. WORNER

**The fundamental structure of textile fibers.** W. T. ASTBURY. *Textile Manufacturer* **58**, 54(1932).—A discussion of the x-ray interpretation of micellar and mol. structure of fibers. CHAS. E. MULLIN

**Process for degumming sisal in the cold.** ER REP-SINED. *Rev. gén. sci.* **43**, 706–9(1932); cf. *C. A.* **27**, 605.—A discussion of the mechanism of a process which is not described, and which apparently consists in stirring the fiber for 10–12 hrs at 15–35° with a soln. of electrolytes (the nature of which is not specified). The effect of this treatment is claimed to be due to modification in the aggregation of the gum resins, which permits transformation of their "colloidal amorphism." A. P.-C.

**Avoiding trouble in manufacturing synthetic yarn goods.** CHAS. E. MULLIN. *Textile Colorist* **54**, 301–4, 346(1932).—The twelve factors causing most of the trouble in woven or knit goods contg. synthetic yarns are discussed. CHAS. E. MULLIN

**The isoelectric point of wool.** A. H. PETTINGER. *Textile Colorist* **54**, 840–1 (1932).—The significance of the isoelec. point is briefly discussed and the values for the isoelec. point of wool obtained by different investigators are reviewed. R. K. W.

**Crepon effects in wool goods.** A. JOHNSON. *Textile Manufacturer* **58**, 172(1932).—A creped fabric may be made by weaving a normal wool yarn with one that has been stretched and steamed. When the fabric is treated with NaOH soln. or is steamed, the stretched yarn shrinks to give the crepe effect. CHAS. E. MULLIN

**The internal linkages and structure of wool and silk.** CHAS. E. MULLIN AND HOWARD L. HUNTER. *Textile Colorist* **54**, 47–51, 59(1932).—A review and discussion of the literature on the internal linkages in wool and silk, as well as the presence of certain groups in the mol. or aggregate, with 36 references. Cf. *C. A.* **25**, 5994, 5995, **26**, 310. CHAS. E. MULLIN

**The free amino, carboxyl and other active groups in wool and silk.** CHAS. E. MULLIN AND HOWARD L. HUNTER. *Textile Colorist* **54**, 111–15, 130(1932); cf. *C. A.* **26**, 310.—The evidence concerning the presence of free amino and carboxyl groups and the formation of quinquevalent N in these fibers is discussed. It appears that such chemically active groups may be present in both fibers, as well as imino and OH groups and carbonyl groups in wool, under suitable conditions. CHAS. E. MULLIN

**The regain of silk of different origins.** WM. S. DENHAM AND A. L. ALLEN. *Textile Mfr.* **58**, 461(1932); *Trans. Faraday Soc.* **29**, 316–17(1933).—A comparison of the desorption regains of silks from different sources. The samples were degummed at 98° in 2 successive baths contg., resp., 1 and 0.5% of soap, and washed in distd. $H_2O$, slightly acid $H_2O$, slightly ammoniacal $H_2O$, and distd. $H_2O$ of about $p_H$ 5. The ash was about 0.03%. The wet samples were then dried in a desiccator over mixts. of $H_2SO_4$ and $H_2O$ of such concns. as to give relative humidities of 92.8 (*a*), 79.7 (*b*), 53.7 (*c*), 40 (*d*) and 21.5% (*e*). When weighed and compared with samples of the same silks dried over concd. $H_2SO_4$, the following regains were found: Italian silk, *a* 16.9, *b* 12.2, *c* 9.3 and *e* 5.4%; Chinese, *a* 16.9, *b* 12.2, *c* 9.3, *d* 7.5 and *e* 5.3%; Japanese, *a* 17.0, *b* 12.3, *c* 9.3, *d* 7.6 and *e* 5.3%; Tussah, *a* 17.9, *b* 12.8, *c* 10, *d* 8 and *e* 5.9%. CHAS. E. MULLIN

**Technic of piece-loading of natural silk.** J. BRUYAS. *Russa* **7**, 729–39, 983–7, 1075, 1077(1932).—Conclusions (from expts. described in detail): Treatment with $SnCl_2$ should be carried out at 15–8°; the Sn:HCl ratio should be kept between 0.820 and 0.830 (theoretical for $SnCl_2$ 0.815) to ensure the absence of traces of free HCl. Phosphate treatment should be carried out with a soln. of $Na_2HPO_4$ contg. an amt. of AcOH such that the soln. contains, in the cold, 0.6% $NaH_2PO_4$; the Sn content of the bath should be maintained at 3–3.5 g. per l. Washings should be effected so that there remains no trace of Sn before phosphate treatment and no trace of phosphate or alky. before $SnCl_2$ treatment. A. PAPINEAU-COUTURE

**The boil-off of silk.** BERNARD S. HILLMAN. *Textile Colorist* **55**, 13–17, 59(1933).

Details of various methods of boiling-off silk in the skein and in the piece are given. RUBY K. WORNER

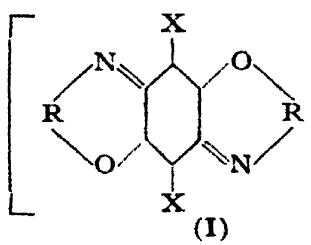
**Dyes.** DAVID A. W. FAIRWEATHER (to Imperial Chemical Industries, Ltd.). U. S. 1,886,947, Nov. 8. In the development of enolic leuco-ester salts of dyes in the presence of a ferric salt, an agent capable of influencing the reversible reaction which the ferric salt undergoes during the development, such as $FeSO_4$ or $NH_4$ oxalate, is added thus facilitating regulation of the process.

**Dyes.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 737,392, May 21, 1932. Dyes are prepd. by reacting phthalimide, 4-chloro-, 3,4(or 3,6)-dichloro- or 4-nitro-phthalimide with $NH_3$ and Mg or Sb. If Sb is used the product does not contain Sb, and if Mg

is used the product contains combined Mg, which is removed by dissolving in concd. $H_2SO_4$ and repptg. The Mg may be reintroduced by reaction with Mg in boiling benzophenone in the presence of O. The most probable structures for the compds. are given.



**Dyes.** I. G. FARBENIND. A.-G. (Arthur Wolfram and Emil Hausdörfer, inventors). Ger. 567,287, May 21, 1931. Blue, green and red dyes for cellulose esters are prepd. by condensing halohydrins with anthraquinone derivs. contg. one or more groups of the formula $NHRNH_2$, where R is an alkyl, aryl or aralkyl residue. Condensation is effected at a raised temp. in the presence of an acid-binding agent and with or without a solvent. Examples are given.

**Dyes.** I. G. FARBENIND. A.-G. Fr. 40,614, July 4, 1931. Addn. to 717,017 (*C. A.* **26**, 2870). Vat dyes contg. $NO_2$ groups such as 7,7'-dinitrothioindigo are converted to compds. sol. in water by the process of Fr. 717,017.

**Dyes.** I. G. FARBENIND. A.-G. Fr. 41,032, July 29, 1931. Addn. to 717,017 (*C. A.* **26**, 2870). The reaction of Fr. 717,017 is carried out in the presence of anhyd. $NH_3$ and tertiary bases. Primary or secondary amines may be used instead of or along with the $NH_3$.

**Dyes.** I. G. FARBENIND. A.-G. Fr. 737,376, May 20, 1932. Dyes which have high affinity for cellulose esters are prepd. by reacting halohydrins such as ethylene chlorohydrin with anthraquinones which contain $-NH_2$ or -NH-alkyl in one $\alpha$-position and one or more $-NH\text{-aryl-}NH_2$ groups in another $\alpha$-position. The products have the formula $1,4,5,8\text{-}(RHN)(X)(X)(X)C_6H_2(CO)_2C_6H_2$ (R is H, alkyl or alkyl-OH and at least one X is -NH-aryl-NH-alkyl-OH).

**Dyes.** I. G. FARBENIND. A.-G. Fr. 737,990, May 26, 1932. Dyes of the general formula I (X is H, halogen, an alkyl or aryl group, R is an arylene group of the $C_6H_6$, $C_{10}H_8$, carbazole or diphenylamine group, the arylene groups being joined in *o*-positions and Y signifies that the dyes may be sulfonated) are prepd. by heating to about 150–300°, 1,4-benzoquinone or its halogen, alkyl or aryl substitution products, with an aromatic amino compd. having at least one position *o*- to the $NH_2$ group unsubstituted, and if desired sulfonating. Several examples are given.

(I)

**Dyes [anthraquinone derivatives].** I. G. FARBENINDUSTRIE A.-G. Brit. 363,027, Oct 8, 1930. 1,4-Diamino-2-aryloxy-3-sulfoanthraquinones are prepd. by heating 1,4-diamino-2,3-dichloroanthraquinones at atm. pressure with a phenol and a sulfite of a strong, preferably inorg., base in the presence of water. Among examples 1,4-diamino-2,3-dichloroanthraquinone is boiled with PhOH and aq. $Na_2SO_3$ to give, upon acidification, 1,4-diamino-2-phenoxy-3-sulfoanthraquinone; this product dyes wool from a faintly acid bath blue-violet shades.

**Dyes.** SOC. POUR L'IND. CHIM. À BÂLE. Fr. 738,252, June 7, 1932. Chromed dyestuffs are prepd. by treating dyes obtained by the union of halo-2-diazo-1-phenolsulfonic acids and 1-hydroxynaphthalene-5-sulfonic acids, with chroming agents. Examples are given.

**Azo dyes.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,955, May 26, 1931. Addn. to 349,600 (*C. A.* **26**, 5428). Azo dyes are obtained by the process of 349,600 with a selection of the diazo component such that the nitrogenous groups of at least one of them are in *m*-position to each other. Greener dyeings are obtained than with the products of 349,600.

**Azo dyes.** J. R. GEIGY S. A. Brit. 364,609, July 4, 1929. Void. See Fr. 37,927 (*C. A.* **26**, 313).

**Azo dyes.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,531, Sept. 20, 1930. Azo dyes are made in substance, on the fiber or on a substratum by coupling a diazo compd. with an arylenedicarbonylbisacetic acid arylide of the formula, $R'NHCOCH_2CORCOCH_2CONHR'$, in which R and R' are substituted or unsubstituted aryl residues, both components being free from groups which would make the dye sol. in $H_2O$. They yield yellow to red shades fast to light. Among arylides mentioned are the anilide, 4-chloro-2-methyl-1-anilide, *p*-aniside and 2,5-dichloroanilide of terephthaloylbisacetic acid; among diazo compds. those from 1-amino-2-methyl-4-nitrobenzene, $\alpha$-aminoanthraquinone and 2,5-dichloroaniline.

**Azo dyes containing chromium.** SOC. POUR L'IND. CHIM. À BÂLE. Brit. 364,147, Sept. 26, 1929. The dyes from diazotized 1,2-aminonaphthol-4-sulfonic acid or its nitrated deriv. and $\alpha$- or $\beta$-naphthol are treated in boiling aq. soln. with an agent yielding Cr, in presence of a proportion of alkali metal ions having no salting-out action on the dye until a dye not pptd. by a satd. soln. of NaCl is formed and the soln. is evapd. at a lower temp., if necessary after filtration and advantageously under reduced pressure.

Chroming agents are Cr chloride, sulfate, acetate, hydroxide, etc. The products are suitable for *dyeing animal fibers* and *leather, coloring varnishes* and for printing in presence of Cr acetate.

**Azo dyes containing chromium.** COMPAGNIE NATIONALE DE MATIÈRES COLORANTES ET MANUFACTURES DE PRODUITS CHIMIQUES DU NORD RÉUNIES ÉTABLISSEMENTS KUHLMANN. Brit. 365,113, Nov. 13, 1929. Void. See Fr. 700,003 (*C. A.* 25, 3492).

**Diazo preparations.** SOC. POUR L'IND. CHIM À BÂLE. Brit 364,490, May 21, 1930. Stable diazo prepns. are made by reaction between a diazonium salt and a di- or polysulfonic acid of a halogenated aromatic hydrocarbon. They are *useful for dyeing* by the ice-color process and may be mixed with diluents or assistants, *e. g.*, alum. Among examples diazotized *m*-nitroaniline is treated with 1,2,4-chlorobenzenedisulfonate or with disulfonated 1,4-dichlorobenzene.

**Stable diazo compounds.** CHEMISCHE FABRIK VORM. SANDOZ. Brit. 365,759, Jan. 7, 1930. Stable tetrazomonoazo compds. are prepd. by adding a suitable metal salt and (or) an arylsulfonate to a soln. of a tetrazo compd. of the formula, *p,p'*-Y-N:$NC_6H_3$(X)$C_6H_3$(X)N:N-R(X)-*p*-N:N-Y, where R is a benzene or naphthalene nucleus, Y an inorg. acid residue and X an alkyl, alkoxy or nitro group or halogen or H, sepg. the ppt. and drying it. They are useful for producing black shades on the fiber and in substance by coupling with 2,3-hydroxynaphthoic acid arylides. Among examples tetrazotized benzidine is coupled with $\alpha$-naphthylamine (1 mol.), again diazotized and the tetrazo compd. pptd. with aq. $ZnCl_2$ and NaCl, and tetrazotized bianisidine is coupled with 3-amino-4-methoxytoluene, again diazotized and pptd. in the same manner.

**Disazo dyes containing copper.** RICHARD STÜSSER and KARL WIEDEMANN (to General Aniline Works). U. S. 1,889,732, Nov. 29. A water-sol. salt of a disazo dye such as the Na salt of the dye formed from tetrazotized 4,4'-diamino-3,3'-dimethoxybiphenyl, 1-hydroxynaphthalene-3,6-disulfonic acid and 2-(*p*-methoxyphenylamino)-5-hydroxynaphthalene-7-sulfonic acid or a similar dye is heated in aq. soln. with a Cu compd. such as $CuSO_4$, $CuCl_2$ or tetrammine cupric sulfate, forming Cu compds. of the dyes which in the form of their alkali metal salts are generally dark powders, sol in water and dyeing cotton and "viscose silk" fast blue to violet shades. Several examples with details of procedure are given.

**Vat dyes.** MAX A KUNZ and KARL KOEBERLE (to General Aniline Works). U S. 1,888,631, Nov. 22. Fast dyes of various colors are obtained by condensing dibenzanthrone or isodibenzanthrone, or a deriv. thereof contg. at least one N atom to which a reactive H atom is attached with an O-free 6-membered ring compd. contg. at least one N atom in the nucleus and substituted by at least one halogen atom, such as halopyridine, halopyrimidine, 2,4-dichloro-6-methylpyrimidine, 2,4,6-trichloropyrimidine, cyanuric chloride, 2-methyl-4,6-dichloro-1,3,5-triazine, 2-phenyl-4,6-dichloro-1,3,5-triazine, 2,4-diphenyl-6-chloro-1,3,5-triazine, etc. The condensation is suitably carried out in solvents or diluting media of a high b. p , such as nitrobenzene, nitronaphthalene, trichlorobenzene, etc., preferably in the presence of acid-fixing agents, such as Na acetate, and condensing catalysts, for instance metal or metal compds., such as Cu, CuO, $CuCO_3$, HgO, Al, etc Several examples are given.

**Vat dyes.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,740, Oct. 6, 1930. One mol. of a polynuclear aromatic compd. contg. in at least each of 2 nuclei at least one reactive H attached to the nucleus is condensed with 2 mols. of an anthraquinone-2-carboxylic acid halide contg. an amino group in the 1-position or a heterocyclic ring in the 1,9-positions, in the presence of an anhyd. metal halide of the Friedel-Crafts type. Alternatively 1 mol. is condensed with 1 mol. and the resulting monoketone is condensed with 1 mol. of the same or a different anthraquinone-2-carboxylic acid halide deriv., both condensations being effected in the presence of anhyd. metal halide. The products are diketone derivs. dyeing fast bright orange to red shades from the vat. Among examples thiazoleanthrone-2-carboxylic acid chloride (1 mol.) is condensed with biphenyl (1 mol.) by means of $AlCl_3$ in $C_6H_5NO_2$ and the monoketone deriv. is condensed with 1 mol. of pyrazoleanthrone-2-carboxylic acid chloride by means of Na-Al chloride.

**Vat dyes.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,832, Dec. 22, 1930. Vat dyes are obtained by condensing a pyrazoleanthrone-2-carboxylic acid halide in which the pyrazole H atom may be substituted by alkyl, aryl or aralkyl, with an aromatic amine contg. in the *o*-position to the amino group a hydroxy, mercapto or further amino group, whereby ring closure may be simultaneous or subsequent to the formation of the carboxylic acid arylamide. The products if not already substituted in the pyrazole nucleus may be alkylated and further substituents may be introduced in the customary manner. Among examples pyrazoleanthrone-2-carboxylic acid chloride is condensed with 1-mercapto-2-aminoanthraquinone with simultaneous ring-closing, and then methylated.

**Vat dyes.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,087, June 28, 1930. Chloro-

dibenzanthrones dyeing navy-blue to dark blue shades fast to spotting with $H_2O$ are prepd. by treating a nitrodibenzanthrone with Cl, or agents supplying Cl, in the absence of any diluent or in the presence of an org. diluent other than phthalic anhydride, or a halogenated deriv. thereof, until the N content is reduced to at most 0.5%. Suitable solvents are chlorobenzene, trichlorobenzene and nitrobenzene, and chlorinating agents include $SO_2Cl_2$, benzotrichloride and BzCl.

**Vat. dyes.** Newport Chemical Corp. Brit. 365,532, Oct. 19, 1929. See Fr. 705,738 (*C. A.* **26**, 313).

**Vat dyes of the thionaphthene-indigoid series.** Wilhelm Bauer, Josef Haller and Georg Rösch (to General Aniline Works). U. S. 1,890,718, Dec. 13. Numerous examples are given of the production of new vat dyes of the probable general formula J—(CO—NH—A)$_n$, where J means the radical of an indigoid dye of the group consisting of thionaphthene-indole indigos, thionaphthene-acenaphthene indigos and thioindigos, A stands for an anthraquinone nucleus, which may be substituted by halogen atoms, alkylalkoxy- or aroylamino groups, $n$ means 1 or 2, and where the —CONHA group is linked to a carbocyclic nucleus of the radical J, said dyes forming yellow-orange to black crystals, difficultly sol. in the usual org. solvents, dissolving in strong $H_2SO_4$ with various colorations, dyeing cotton from an alk. hydrosulfite vat strong orange to black shades of good fastness. Dyes of this character may be obtained by a process in which an isatincarboxylic acid is first condensed with hydroxythionaphthene or a homolog or nuclear substitution product thereof, which may also be derived, for example, from naphthalene. For the condensation also such compds. may be used as are converted during the reaction into hydroxythionaphthenes, such as the corresponding carboxylic acids, acetyl derivs., etc. Thus are obtainable indigoid compds. which still contain a carboxylic acid group in the carbocyclic ring system of the isatin residue and are consequently sensitive to alkali. When the carboxylic acid is now converted into the acid chloride or some other reactive carboxylic acid deriv. and this is caused to react with an aminoanthraquinone (which can also be substituted in the nucleus as desired), there are produced in an excellent yield fast new vat dyes, contg. both an indigoid and an anthraquinone residue. The process can also be carried out by first converting the isatincarboxylic acid into the corresponding acid chloride or some other reactive deriv., causing the same to react with an aminoanthraquinone and condensing the resulting isatincarbonylaminoanthraquinones (which are themselves vat dyes), with hydroxythionaphthenes. Some other modifications and alternative procedures also are described. Cf. *C. A.* **26**, 1797.

**Pigment dyes.** I. G. Farbenindustrie A.-G. Brit. 365,600, Oct. 19, 1929. Dyes which may be used for coloring lacquers and varnishes are prepd. by halogenating, either alone or in the presence of a high-boiling solvent, (a) diarylaminohalo-1,4-benzoquinones, or (b) diarylaminobenzoquinones with the formula 2,5-(R'YN'RHN)$_2$-3-X-1,4-C$_6$H(:O)$_2$, in which X is H or halogen, R and R' the same or different aryl residues which with the nitrogen N' may form a carbazole ring, and Y alkyl, aralkyl or H. Acid dyes are obtained by sulfonation. These yield insol. inorg. salts, usable as lakes, and sol. salts with org. bases usable for coloring spirit, nitrocellulose and celluloid lacquers. Among examples, 2,5-di(*N*-benzylcarbazolyl-3-amino)-3,6-dichloro-1,4-benzoquinone is subjected to ring closure by heating and is brominated in fluorosulfonic acid, and 2,5-di(*β*-naphthylamino)-3,6-dichloro-1,4-benzoquinone is subjected to ring closure and is treated in hot $PhNO_2$ with Cl in the presence of I. The product is sulfonated with oleum.

**Stable dry composition for silk dyeing.** Louis Philippe. U. S. 1,889,491, Nov. 29. An acid dye is used together with a hygroscopic acid salt such as $NaHSO_4$ capable of hydrolyzing in water to release free acid for combination with the dye, the particles of the salt being coated with an antihydroscopic agent such as starch. $Na_2SO_4$, gelatin, etc., also may be added.

**Sulfide blacks.** E. I. du Pont de Nemours & Co. Brit. 364,048, Sept. 24, 1930. In the manuf. of sulfide blacks by heating nitrophenols with polysulfides a thiosulfate is added to the mass undergoing fusion to raise the b. p. of the mixt. and render it more mobile.

**Lakes.** E. I. du Pont de Nemours & Co. Brit. 365,943, May 27, 1930. Lakes are made by bringing together in an acid medium an aliphatic amine or mixt. of such amines, a complex inorg. acid, *e. g.*, phosphotungstic, phosphomolybdic, or its components, and a basic dye. Among dyes mentioned are Et violet, Victoria Green, Rhodamine B extra, etc. The amines are conveniently used as their hydrochlorides.

**Colored lakes,** Imperial Chemical Industries, Ltd. Fr. 738,029, June 1, 1932. Colored lakes of high tinctorial power and fastness are made by reacting basic dyes (which may also contain acid groups) with hetero-poly-acids contg. P, Mo, Si and W, *e. g.*, phosphotungstic, phosphomolybdic, silicotungstic, molybdophosphotungstic and

silicomolybdotungstic acids, and organo-hetero-poly-acids contg. radicals of gallic and tannic acids, *e. g.*, gallomolybdic and gallotungstic acids. Several examples are given.

**Anthracene derivatives.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 738,030, June 1, 1932. The manuf. of sulfuric esters of reduced dianthraquinonazines is characterized by the fact that tetrasulfuric esters of tetrahydroanthraquinonazine or dihydroazine or their substitution products are converted by oxidizing agents into disulfuric esters of tetrahydroanthraquinonazines. Alkali hypochlorites are used as oxidizing agents, if desired in the presence of an acid such as boric or $CO_2$, or persulfates in alk. soln. The disulfuric ester of anthraquinoneanthrahydroquinonazine, which the product is likely to contain, is eliminated. The manuf. of sulfuric esters of reduced dianthraquinonehydroazines is characterized by the fact that disulfuric esters of tetrahydrodianthraquinonazines or their substitution products are converted by an acid treatment into monosulfuric esters of anthraquinoneanthrahydroquinonehydroazines. The products are used for *dyeing textiles* the color being developed by the action of heat in acid soln.

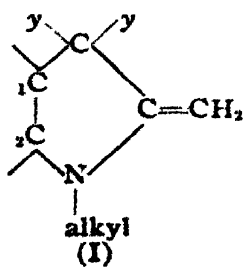
**Anthraquinone condensation products.** I. G. FARBENIND. A.-G. Fr. 738,031, June 1, 1932. Products which dye wool, cotton and viscose are prepd by causing a 1-amino-4-haloanthraquinone-2-sulfonic acid to react with an amino compd. of the biphenyl series, such as 4-aminobiphenyl, 4-amino-2,4′-dichloro(or dibromo)biphenyl, 4-amino-4′-methoxy(or ethoxy)biphenyl, hydrogenated 4-aminobiphenyls, 4-aminoacetyl (or propionyl)aminobiphenyl and 4-amino-3,3′-dimethoxy-4′-acetylaminobiphenyl.

**Anthraquinone derivatives.** SOC. POUR L'IND CHIM. À BÂLE. Fr. 738,251, June 7, 1932. New derivs of anthraquinone are prepd by reacting 1-acylamino-3-haloanthraquinones with derivs. contg. at least one interchangeable atom of H or a metal joined to N, O or S. The products may be treated with substituting or condensing agents. Acyl derivs include the 1-formamido-3-bromo, 1-acetamido-3-bromo, 1-benzamido-3-bromo, 1-(4′-chlorobenzamido)-3-chloro, 1-naphthoylamino-3-chloro, 1-(2′-ethoxynaphthoylamino)-3-bromo, 1-phenylsulfonamido-3-bromo, 1-naphthalenesulfonamido-3-chloro, 1-(1′-anthraquinonecarbonylamino)-3-chloro and the 1-(2′-anthraquinonecarbonylamino)-3-bromo compds. The other derivs. include alcoholates, phenolates, xanthates, mercaptans, thiophenols, thionaphthols, sulfonamides, $NH_3$, $NH_2Me$, glycine, $PhNH_2$, toludine, phenylenediamine, naphthylamine, aminoanthraquinones, aminopyranthrones, aminoanthanthrones and aminodibenzanthrones. The *products are dyes and (or) intermediates*. Several examples are given.

**Thio derivatives of phenol.** IMPERIAL CHEMICAL INDUSTRIE, LTD. Fr. 737,665, May 26, 1932. Non-dyeing derivs of PhOH are made by reacting with heat, PhOH (1 mol.), S (2 at. proportions) and an alkali or alk. earth hydrosulfide ($^1/_4$ to $^1/_2$ mol. proportion or equiv., according to the case). The products are *mordants for basic dyes* and when treated with an alkali sulfite and an oxidizing agent such as air may be used to create reserves on animal fibers.

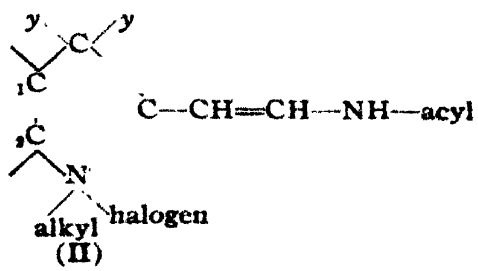
**1,1′-Dianthraquinonyl-2,2′-diurethans.** WM. SMITH and JOHN THOMAS (to Scottish Dyes, Ltd.). U. S. 1,890,098, Dec. 6. Products suitable for use as flavanthrone *dye intermediates* are obtained by heating anthraquinone-1-halo-2-urethans with Cu at 135–175°.

**Nitroarylamino derivatives of leuco sulfuric acid esters of anthraquinonoid and indigoid compounds.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,187, Oct. 7, 1930. *N*-Substitution products of leuco sulfuric esters of anthraquinonoid and indigoid compds. contg. amino groups are obtained by treating the esters with nitrohaloaryls, contg. labile halogen, in the presence of acid-fixing agents. Among examples the K salt of the leuco sulfuric ester of β-aminoanthraquinone is condensed with 2,4-d nitrochlorobenzene in presence of MgO. The product, when treated with acid oxidizing agents on the fiber, gives fast yellow shades.



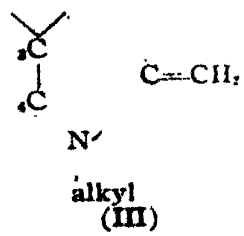
**Dyes and intermediates.** I. G. FARBENINDUSTRIE A.-G. Brit. 362,696, Dec. 22, 1930. Addn. to 308,651 (*C. A.* **24**, 506). Benzanthrone-*peri*-dicarboxylic acid or a deriv. or substitution product is condensed with an aromatic *o*-diamino compd. by heating in the presence of an indifferent solvent or diluent at below 80°. The dicarboxylic imides formed are further ring-closed by heating to a higher temp. or reduced to a vat while heating. Among examples benzanthrone-*peri*-dicarboxylic anhydride is condensed with *o*-phenylenediamine, followed by ring closure. Cf. *C. A.* **27**, 1201.

**Dyes and intermediates.** E. I. DU PONT DE NEMOURS & Co. Brit. 363,647, June 13, 1930. Dicarboxy derivs. of arylaminoanthraquinones are prepd. by condensing a 1-haloanthraquinone-2-carboxylic acid with a primary aminoarylcarboxylic acid, other than an aminodiarylketone-*o*-carboxylic acid, in an alk. medium in the presence of a catalyst, *e. g.*, $CuCl_2$ or $CuSO_4$. Among examples 1-chloroanthraquinone-2-carboxylic acid is condensed with *p*-aminobenzoic acid. The products are converted to the



dicarboxylic acid chloride derivs. by treatment with $PCl_5$, etc., in an inert solvent during which conversion ring closure may also take place to the corresponding *Bz*-carbonyl chloride deriv. of anthraquinone-2,1-arylacridone. Thus the 1-(*p*-carboxyphenylamino)anthraquinone-2-carboxylic acid obtained in the above example when treated with thionyl chloride in solvent naphtha gives the *Bz*-3-carbonyl chloride of anthraquinone-2,1-benzacridone. Anthraquinone-2,1-arylacridone dyes are obtained by condensing these anthraquinone-2,1-arylacridone-*Bz*-carbonyl chloride derivs. with primary aliphatic or aromatic amines. They dye cotton and rayon yellowish pink to light violet-red when simple amines are employed and cotton red-orange to brown when aminoanthraquinones are used. Numerous examples are given.

**Dye intermediates of the anthraquinone series.** Wm. Smith and John Thomas (to Scottish Dyes, Ltd.). U. S. 1,890,099, Dec. 6. Products such as 2-amino-3-chloroanthraquinone are formed by treating a halogenated aminoanthraquinone having the halogen in the $\alpha$-position, such as 1,3-dichloro-2-aminoanthraquinone in suspension (suitably in water) with a reducing agent such as Na hydrosulfite in the presence of an alkali metal or alk. earth hydroxide.



**Dye intermediates and dyes of the polymethine series.** Richard Kuhn and Walter Kern (to Soc. pour l'ind. chim. à Bâle). U. S. 1,886,485, Nov. 8. New intermediate products and dyes are obtained from cyclic $NH_4$ salts having a methyl group capable of reaction in $\alpha$-position to the N, or from the methylene bases thereof of the general formula $\overset{1}{C}:\overset{2}{C}.N(alkyl).C(:CH_2).X$, where the pair of C atoms $C_1=C_2$ belongs to an aromatic nucleus, such as an unsubstituted or substituted benzene or naphthalene residue and $x$ stands for a bivalent org. residue, such as —CH=CH—, —S—, —$CH_2$—, =$CMe_2$, =$CEt_2$, etc. Among such products are: *N*-ethyl-2-methyleneedihydroquinoline and its derivs. substituted in the benzene nucleus; *N*-methyl-2-methylenebenzothiazoline and its derivs. substituted in the benzene nucleus; 1,3,3-trimethyl-2-methyleneindoline and its derivs. substituted in the benzene nucleus. Various *intermediates formed may be used for pharmaceutical purposes*, and numerous examples with details of procedure are given, and the process of dye manuf. is generally defined and claimed as involving treating one mol. proportion of a methylene base of the indolenine series of the general formula I, where the pair of C atoms $C_1=C_2$ belongs to a benzene or a naphthalene nucleus and the two *y*'s stand for H or alkyl residues, in the presence of an acylating agent with one mol. proportion of a mineral acid salt of a deriv of formic acid of the general formula HC(:NH)*w*, where *w* stands for halogen or $NH_2$ or O—$C_2H_5$ or O—CO—$CH_3$, to produce a salt of the general formula II, where the pair of C atoms $C_1$—$C_2$ belongs to a benzene or a naphthalene nucleus, and the two *y*'s stand for H or alkyl residues, and then treating the base obtained from this salt by treatment with alkalies with one mol. proportion of a methylene base of the general formula III where the pair of C atoms $C_3=C_4$ belongs to a benzene or a naphthalene nucleus, and *x* stands for —CH=CH— or —S— or —$CH_2$— or =$C(alkyl)_2$.

(I)

(II)

(III)

**Dyeing fabrics.** Geo. R. Hudson. Brit. 363,358, Sept. 11, 1930. A web of textile fabric is printed, coated with color or color-embossed by passing it with a web of moistened linen, etc., between printing or embossing rollers and coöperating heated impression rollers which cause steam to be generated to transfer or fix the design.

**Dyeing fabrics.** Geo. R. Hudson. Brit. 363,359, Sept. 11, 1930. A textile fabric is printed or coated with color by pressing it with a moistened lamina between a pair of platens, one of which is provided with blocks or dies and the other heated to generate steam to fix the design.

**Dyeing animal fibers.** Soc. pour l'ind. chim. à Bâle. Brit. 364,148, Sept. 26, 1929. Wool is dyed fast tints by treatment first in a bath of an acidity substantially less than corresponds to 3% $H_2SO_4$ (calcd. on the wt. of the wool) and contg. a Cr compd. of an azo dye derived from a substituted or non-substituted 1-diazo-2-naphthol-

4-sulfonic acid and a substituted or nonsubstituted naphthol, and subsequent development of the dyeing on the fiber in a more strongly acid medium.

**Dyeing cellulose derivatives.** I. G. FARBENIND. A.-G. Fr. 737,676, May 26, 1932. Cellulose esters or ethers are dyed with a *p*-aminomonoazo dye, insol. in water, contg. no COOH or $SO_3H$ groups and corresponding to the general formula $H_2N$—R—N=N—$R_1$—NYY (R is a radical of the $C_6H_6$ series substituted by at least one alkoxy group, $R_1$ is a radical of the $C_6H_6$ series and the 2 Y are aliphatic, hydroaromatic or aliphatic aromatic radicals, identical or different or together represent an alicylic radical, or $R_1$ is a tetrahydronaphthalene and the Y represent H or aliphatic radicals). The monoazo dye is diazotized on the fiber and coupled with a compd. of the formula 2,3,6,7-$(HO_2C)(HO)(X)(X')C_{10}H_4$ (X is H and X' is alkoxy or alkyl, or X and X' together represent a $C_6H_6$ ring joined to the $C_{10}H_8$ ring). A large no. of examples is given.

**Dyeing cellulose ethers.** LEON LILIENFELD. U. S. 1,890,392, Dec. 6. A cellulose ether is softened without dissolving it and is dyed while in such softened condition. Numerous details and examples are given.

**Dyeing and printing.** JULES MARTIN (known as Gaudit). Brit. 365,103, Aug. 2, 1929. Void. See Fr. 679,705 (*C. A.* **24**, 3910).

**Dyeing and printing.** I. G. FARBENIND. A.-G. Fr. 736,874, May 9, 1932. Insol. azo dyes are prepd. in the fiber by means of mixts. contg. (*a*) a substantive azo component and (*b*) an amino diazo component sol. in water and derived from an aromatic diazo component or an alkali salt of an aromatic nitrosamine. The fibrous material to which the above components have been applied are passed into a bath contg. an aq. soln. of one or more org. acids, $H_3PO_4$, metal salts easily dissocd. of inorg. acids or salts capable of liberating acids or mixts. of such agents, and the treated material is dried on cylinders or in heated chambers. A similar treatment is used in obtaining colored reserves.

**Printing textiles.** I. G. FARBENIND. A.-G. Fr. 40,738, Mar. 2, 1931. Addn. to 727,727 (*C. A.* **26**, 5770). Textiles are printed with vat or S dye prepns. contg. aminoanthraquinones, their *N*- or ring-substituted derivs. or reduction products of these compds. contg. O. Examples are given.

**Printing textiles.** I. G. FARBENIND. A.-G. Fr. 40,899, June 26, 1931. Addn. to 727,727 (*C. A.* **26**, 5770) Textiles are printed with vat or S dye prepns. contg. anthraquinone-sulfonic or -carboxylic acids or their salts or reduction products of these compds. still contg. O. Anthraquinone, hydroxyanthraquinone, aminoanthraquinone or their reduction compds. contg. O may also be present.

**Printing textiles with thioindigoid vat dyes.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,052, Feb. 15, 1930. Stronger prints and more rapid fixation are obtained in printing with thioindigoid vat dyes by incorporating in the pastes, contg. a thickening agent, hydrosulfite as reducing agent, an alkali and any other usual addns., a salt, oxide or hydroxide of a non-alkali or non-alk. earth metal to the extent of 0.05–0.5 mol. per mol. of pure dye The oxide, hydroxide or salt may be mixed with the dye paste before making the latter into the printing paste. Among examples 4,4'-dimethyl-6,6'-dichlorothioindigo is pasted with glycerol, wheat starch-tragacanth thickening, Na benzylsulfanilate, $Na_2CO_3$ and hydrosulfite, the paste is heated to reduce the dye, mixed with $FeCl_3$ and Na formaldehydesulfoxylate, printed on the material and the latter steamed, washed and finished.

**Printing textiles.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,153, Sept. 30, 1930. Addn. to 364,052 (preceding abstr.). In printing with thioindigoid vat dyes in the form of pastes contg. the dye, an alkali carbonate, Na formaldehydesulfoxylate, a thickening agent and any other usual addns., more intense prints are obtained by adding a salt, oxide or hydroxide of a non-alkali or alk. earth metal to the extent of less than 1 mol. per mol. of pure dye.

**Making and dyeing cellulose compounds.** SOC. POUR L'IND. CHIM. À BÂLE. Brit. 363,897, Feb. 21, 1930. Addn. to 342,167 (cf. Ger. 554,781 (*C. A.* **26**, 6159)). The process of 342,167 is modified by treating cellulose material, *e. g.*, cotton yarn, with a compd. contg. a N:C-halogen group to produce a compd. still contg. at least 1 reactive halogen group and then with a compd. contg. an exchangeable H or equiv. atom and at least 1 chromophor or group capable of forming a dye or a residue convertible into such a group. The product may be converted into a dye by diazotizing and coupling with a coupling agent, or by coupling with a diazo compd. In an example cotton yarn is treated successively with alc. NaOH, cyanuric chloride in xylene and *p*-diaminodiphenylmethane in dil. alc., diazotized and coupled with β-naphthol, giving a yellowish red color. Bianisidine may be used as the chromophoric substance.

**Apparatus for dyeing textile materials in bundles.** JOSEPH ANNICQ. U. S. 1,890,556, Dec. 13. Structural features.

**Machines for dyeing cloth.** HANS NABHOLZ. Fr. 737,873, May 31, 1932.

**Apparatus for printing colors on threads.** DANIEL B. BONNER. Brit. 363,633, Sept. 18, 1929.

**Washing, rinsing, drying and dyeing machines.** CHARLES FLORI. Brit. 363,927, April 1, 1931. The app. comprises a perforated drum in which these operations may be conducted successively.

**Treating textiles.** WM. MARSHALL. Brit. 363,883, Feb. 7, 1931. In treating with caustic alkalies threads and fabrics made from regenerated cellulose or mixts. thereof with natural cellulose or other fibers the regenerated cellulose is protected from damage by adding a K, Na or $NH_4$ carbonate or bicarbonate or mixt. thereof to the wash water. NaCl may also be added.

**Treating textiles.** ALFRED W. BENNIS. Brit. 364,130, June 28, 1930. See Fr. 714,050 (*C. A.* **26**, 1803).

**Treating textiles.** RAYMOND VIDAL. Fr. 737,577, Sept. 19, 1931. Linen, hemp, jute, etc., are freed from incrustation and gummy substances by boiling in an aq. soln. of an alkali sulfite. Silks, vegetable fibers, etc., are treated with an aq. soln. of an alkali sulfite before treatment with hypochlorites.

**Treatment of textiles and leather.** ERBA FABRIK CHEMISCHER PRODUKTE SPEZIALITÄTEN FÜR DIE TEXTILINDUSTRIE. Brit. 364,327, Dec. 28, 1929. See Fr. 707,966 (*C. A.* **26**, 1134).

**Treating textile fibers, etc.** SOC POUR L'IND CHIM. À BÂLE. Brit. 363,284, June 2, 1930. Threads, composed of fibers of org. esters of undegraded cellulose obtained by the esterification of natural cellulosic fibers or of artificial fibers of undegraded cellulose, are reduced in denier and improved by subjection to a stretching process in the presence of a swelling agent, *e. g.*, dil. AcOH or formic acid, pyridine, aq solns. of $NH_4SCN$.

**Treating vegetable fibers.** EUGENE VICTOR HAYES-GRATZE. Brit. 363,651, Sept. 12, 1930. See Fr. 721,871 (*C. A.* **26**, 4185).

**Treating animal fibers.** EUGENE V. HAYES-GRATZE. Brit 363,652, Sept. 12, 1930. See Fr. 721,872 (*C. A.* **26**, 4185).

**Loading textile fibers.** WALDEMAR ZANKER. Brit. 365,085, Sept. 13, 1929. See Fr. 702,964 (*C. A.* **25**, 4415)

**Felting silk.** ALESSANDRO GANDINI. Brit 364,815, Dec 22, 1930. See Fr. 708,173 (*C. A.* **26**, 1136).

**Fibroin solutions.** I. G. FARBENIND A.-G. (Herbert Mahn and Wilhelm Irion, inventors). Ger. 567,384, Feb. 24, 1931. Solns of fibroin in concd. solns. of salts are rendered more homogeneous and less viscous by adding an amide before, during or after the addn. of the fibroin. The salt used may be NaCNS, and the amide may be $HCONH_2$, $AcONH_2$ or urea. Adsorption compds. of salt and fibroin, such as may be pptd. from solns. of fibroin in salt solns., may be liquefied by adding an amide. Cf *C. A.* **27**, 1210.

**Rayon.** GLANZSTOFF-COURTAULDS G M B H Fr. 41,084, Nov. 23, 1931. Addn to 694,516 (*C. A.* **25**, 2008). Nappes of thread which have been wound on bobbins and removed therefrom are treated in the same way as the cakes of Fr 694,516.

**Rayon.** SHOZABURO HOSHINO. Fr. 737,637, May 26, 1932. Fibroin dissolved in an alk. soln. of metals is spun and coagulated by a bath contg. a neutral salt mixed with a free acid in amt. such that all the salt is not converted to acid salt, *e. g.*, $H_2SO_4$ is added to a soln. contg. $Na_2SO_4$ and $(NH_4)_2SO_4$. Fr 737,638 Rayon is made from a soln. mixed with an alkyl ester or alkyl salt, such as AcOMe, AcOAm, AcOEt or an alkyl chloride.

**Rayon.** SHOZABURO HOSHINO. Fr. 738,054, June 2, 1932. A colloidal soln. of fibroin is spun into a coagulating bath, obstacles being disposed in the path of the thread to stretch it, submitting it to a friction and a resistance increasing progressively as the action of the coagulant progresses.

**Apparatus and process for treating rayon.** VEREINIGTE GLANZSTOFF-FABRIKEN A.-G. Brit. 364,489, June 5, 1930. Spun cakes of rayon are arranged on holding devices which are then attached to an endless belt or chain and passed through spraying, trickling or immersion baths. App. is described.

**Treating rayon.** ALGEMEENE KUNSTZIJDE UNIE N. V. Brit. 363,257, Feb. 11, 1931. For washing and aftertreating rayon cakes a perforated tube divided longitudinally is provided and the cakes, preferably wrapped in permeable wide-meshed fabric, are laid beside one another in the tube in a longitudinal direction. Cf. *C. A.* **27**, 430.

**Delustering rayon.** BRITISH CELANESE, LTD. Brit. 363,426, Oct. 5, 1929. A subdued luster is imparted to filaments, etc., made of or contg. cellulose acetate or other org. deriv. of cellulose by treating with a mixt. of a solvent for the deriv. and a non-solvent therefore and allowing or causing evapn. of the mixt. on the material so that its solvent power decreases.

**Treating rayon.** BRITISH CELANESE, LTD. Brit. 364,020, Oct. 8, 1929. Addn. to 363,426 (preceding abstr.). Filaments, threads, straws, etc., made of or contg. cellulose acetate or other org. esters of cellulose [illegible] solvent under such conditions that the filaments, etc., are united into a larger unitary product either uniformly along their length or intermittently, while at the same time the luster is subdued. Thus acetone-sol. cellulose acetate is treated with 5–20 parts xylene and 80–95 parts of acetone.

**Conditioning artificial filaments, etc.** BRITISH CELANESE, LTD., ROBERT P. ROBERTS and SIDNEY A. WELCH. Brit. 365,621, Oct. 15, 1930. Artificial filaments, yarns, etc., contg. org. derivs. of cellulose are conditioned by applying a plastifier, softener or swelling agent for the cellulose deriv., a lubricating agent, and a hygroscopic solid. Softening agents include polyhydric alcs., *e. g.*, diethylene glycol, glycerol, etc., xylene, toluene, triacetin, etc. Lubricating agents include castor oil, olive oil, lard, rape oil, etc., and mineral oils, also fatty acids derived from animal or vegetable oils. As an example Na or K acetate is added to a mixt. of ethylene glycol and olive oil. The liquids may be applied separately.

**Crepe threads, etc.** HENRY DREYFUS. Fr. 737,451, May 23, 1932. Threads composed of or contg. cellulose derivs. are creped by applying only a part of the torsion, moistening with water, partly or wholly drying and then applying in one step the rest of the torsion required. Fr. 737,452. Moistening with water is replaced by steaming.

**Increasing the luster of cellulose derivatives such as cellulose acetate.** GEORGE H. ELLIS and HENRY C. OLPIN (to Celanese Corp. of Am.). U. S. 1,890,643, Dec. 13. Materials which have been delustered by the action of hot aq. media have their luster restored, at least locally, by treatment with superheated steam.

**"Refining" operations on textile materials, as in mercerizing, carbonizing, bleaching, dyeing, etc.** HEINRICH BERTSCH (to H. Th. Böhme A.-G.). U. S. 1,890,492, Dec. 13. In carbonizing, mercerizing or similar treatments of textile materials with liquids contg. substances such as $H_2SO_4$, etc., which cause decompn. in solns. of ordinary Turkey-red oil and Monopole soap, there is added to the liquids a sulfonate prepd. by sulfonating a fat or the like such as ricinoleic acid in the presence of a water-binding acid substance such as $Ac_2O$.

**Sizing textiles.** ALEXANDRE I KOUSNETZOFF. Brit. 363,448, Oct. 15, 1930. See Fr. 709,431 (*C. A.* **26,** 1455).

**Sizes.** ÉTABLISSEMENTS GAMMA. Brit 364,902, Jan. 20, 1931. See Fr. 726,515 (*C. A.* **26,** 4964).

**Apparatus for sizing textile threads on beams or spools.** JOSEPH ANNICQ. Brit. 363,334, Sept. 25, 1929. Void.

**Wetting, etc., agents.** SOC. POUR L'IND. CHIM. À BÂLE. Brit. 365,468, May 28, 1930. Sulfuric esters for use as wetting agents and assistants in the textile industry are made by treating with the addn. product of $SO_3$ and an org. base a natural or artificial resin, contg. OH, or a hydroxy fatty acid contg. more than 9 C atoms or a deriv. thereof Among examples colophony is treated with chlorosulfonic acid and dimethylaniline in monochlorobenzene.

**Detergents.** WILLIAM PEEL. Brit 363,794, Nov. 25, 1930. Detergents for removing oil and other spots from fabrics are prepd. by emulsifying liquid hydrocarbons or chlorohydrocarbons in an aq. soln. of castile soap and adding a small quantity of weak acid, *e. g.*, AcOH, $H_3BO_3$, to neutralize the free alkali.

**Bleaching composition.** PIERRE SEGUIN. Fr. 737,956, Sept. 26, 1931. A bleaching compn for linen contains Marseilles soap, turpentine oil, $NH_3$ and pine oil.

**Waterproofing cloth, etc.** PAPETERIES NAVARRE (SOC. ANON.). Fr. 737,917, Sept. 22, 1931. Cloth, paper, etc., are waterproofed by impregnation, coagulation and pptn. of a soln. of cellulose xanthate.

**Mildewproofing fabrics.** WM. H. ADAMS (to Eastern Finishing Works). U. S. 1,890,717, Dec. 13. Fabric such as cotton is satd. with a mildew-resistant agent such as various metal salts and carries on its faces different mildew-resisting agents such as oil, wax and metal salt mixts. which are kept from reacting with each other by the satg. material in the body of the fabric.

**Imitation fur.** ABRAHAM UNGER (to Concord Chenille Co.). U. S. 1,889,733, Nov. 29. Chenille is laid upon a support in accord with a desired design and suction is applied to maintain the position of the chenille in the design; the chenille is cemented to a suitable backing by an adhesive and after discontinuing the suction the chenille and backing are subjected to pressure. App. is described.

**Marking rope or other absorbent materials for identification.** ERNEST H. HUNTRESS and ELLIS W. BREWSTER. Brit. 363,881, Feb. 6, 1931. See U. S. 1,822,098 (*C. A.* **26,** 2330).

# 26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

**Paints and painting methods for gas work.** J. T. LAWRENCE. *Gas Engr.* **50**, 65–7 (1933).—A discussion of paint qualities, the proper methods for application and numerous troubles encountered in paint jobs. P. J. WILSON, JR.

**Flat wall paints with Titanox-C.** D. W. ROBERTSON. *Official Digest, Fed. Paint & Varnish Production Clubs* No. **121**, 1076–81(1932).—Important requirements of flat wall paints are full body, easy working, good levelling, good hiding and good aging characteristics. Good body is usually obtained by addn. of $H_2O$ and soaps. Detailed directions for prepg. a linseed oil treated with hydrated Mg are given. The use of bodied, blown and other types of oils in adjusting the working properties of paints is discussed. Non-reactive pigments combined with suitably adjusted vehicles are capable of greater latitude in formulation than treated pigments. Titanox-C is considered to fulfill the ideal requirements for a flat wall paint pigment. G. G. SWARD

**Paint and varnish in the electrical industry.** W. G. BIRRELL. *Official Digest Fed. Paint & Varnish Production Clubs* No. **120**, 1039–43(1932).—The elec. industry requires a wide variety of special paints. Many of them must withstand high temps., oil, $H_2O$ and mild acids, must have a high dielec. strength, and remain flexible over a long period of time. A few methods of test and their significance are given. G. G. S.

**Some paint problems of building research.** H. M. LLEWELLYN. *J. Oil & Color Chem. Assoc.* **16**, 3–22(1933); cf. *C. A.* **26**, 2068.—Paint problems comprise 4% of the inquiries directed to the Building Research Sta. (England). Expts. on the painting of plaster and cement show that free CaO alone does not cause paint failures, but that alkali salts and $H_2O$ must be present. Prevention of mold growth on paints remains unsolved. G. G. SWARD

**A study of priming coat reductions for painting new wood surfaces.** PETER GYDESEN, M. H. SIME AND F. L. BROWNE. *Official Digest Fed. Paint & Varnish Production Clubs* No. **121**, 1068–71(1932); cf. *C. A.* **26**, 1138.—After exposure for 10 months there are no differences in the appearances of the paints that can be attributed to variations in the priming coat reductions. It is too early to consider differences in integrity of, and protection by, the films. A few remarks concerning the appearances due to the natures of the paints themselves are given. G. G. SWARD

**New fireproof paints demanded.** L. ROHDE. *Farbe u. Lack* **1933**, 45–6.—The revival in Germany of the use of wood in the construction of dwellings has stimulated renewed interest in fireproof paints. Some formulas for such paints are given. G. G. SWARD

**Formation of blue and violet spots on white paint.** F. WACHHOLTZ. *Farben-Ztg* **38**, 533–4(1933).—Two cases of blue and violet spots observed on white paints were due to org. Fe compds. and not to Co, as suspected. The probability of microörganisms being directly responsible is considered. G. G. SWARD

**Report of subcommittee VIII on methods of analysis of paint materials.** F. W. SMITHER, *et al. Proc. Am. Soc. Testing Materials* **32**, Pt. I, 377–85(1932).—Method D34–30 for the routine testing of basic sulfate white lead is replaced by the one given in Federal Specification TT-W-261, and the methods for pigments contg. it are modified accordingly. Various modifications are recommended in the methods of routine analysis of white linseed oil paints (D215–29), of dry red lead (49–29), of yellow, orange, red and brown pigments contg. Fe and Mn (D50–27), of yellow and orange pigments contg Cr compds., blue pigments and chrome green (D126–27), of Ti pigments (D186 29), of dry $Cu_2O$ (D283–29) and of dry HgO (D284–29), and of testing for hydroscopic $H_2O$ (and other matter volatile under the test conditions) in pigments (D280–31). A. PAPINEAU-COUTURE

**Determination of the critical oil requirements of paints.** G. ZEIDLER AND B ROSEN. *Farben-Ztg.* **38**, 403–4, 427–9(1933).—The calcn. of the crit. oil content of paints is demonstrated. Cf. *C. A.* **26**, 1456, 3122, 5436. G. G. SWARD

**Can catalytic reactions occur in paint?** HANS HEBBERLING. *Farben-Ztg.* **38**, 402 (1933).—A discussion of the causes for the now rarely observed darkening of lithopone paints. G. G. SWARD

**Petroleum asphalts, their properties, manufacture and uses in the paint industry.** W. L. LINTON, V. L. SHIPP AND M. F. PRATT. *Official Digest Fed. Paint & Varnish Production Clubs* No. **122**, 4–12(1933).—The chemistry of asphalts, the manuf. of asphaltic products by fractional distn., their testing and uses in paints are described. G. G. S.

**Coke-oven distillates in the paint and varnish industry.** J. KENNY. *Official Digest Fed. Paint & Varnish Production Clubs* No. **123**, 48–59(1933).—Address. G. G. SWARD

**Recent physical and chemical developments in the field of pigments.** A. FOULON. *Farbe u. Lack* **1933**, 21–2, 31–2.—A no. of recent German patents on pigments are reviewed. G. G. SWARD

**Some vagaries of mineral pigments.** A. W. C. HARRISON. *Paint Manuf.* **3**, 44–6 (1933).—The adverse influences of various pigments on drying times of paints, variations in color of identical pigments, metallic soap formation in paints, etc., are discussed. G. G. SWARD

**Yellow pigments for façades.** R. SCHWARZ. *Farbe u. Lack* **1933**, 52–3, 69.—Some practical notes governing the use of suitable pigments for plaster and concrete surfaces are given. G. G. SWARD

**Zinc white in white enamels.** P. KAMP. *Farben-Ztg.* **38**, 453–5, 479–80(1933).—With properly chosen vehicles and sequence of steps in manuf., ZnO enamels free from thickening, settling or formation of gritty matter are obtainable. An analogy is drawn between aq. colloidal states and oleo-colloidal systems. G. G. SWARD

**Tuscan reds, bone blacks and Hoover browns.** E. M. GILES. *Official Digest Fed. Paint Varnish Production Clubs* No. **123**, 60–8(1933).—Address. G. G. SWARD

**Stoving blacks.** A. W. C. HARRISON. *Paint Manuf.* **2**, 273–6, 303–6(1932).—Raw materials, typical formulas and cooking directions for black baking enamels are given. G. G. SWARD

**Some consideration for the evaluation of substrates.** HANS WAGNER. *Paint & Varnish Prod. Mgr.* **9**, No. 2, 10, 12, 34(1933).—The following properties are important in the evaluation of substrates for lake pigments: (*a*) brightening power, (*b*) adsorption of basic dyestuffs, (*c*) wetting characteristics and (*d*) swelling in $H_2O$. Substrates should be low in *a* and *d*, high in *b* and *c*. A no. of commonly used substrates are discussed with respect to the above properties. Cf. *C. A.* **27**, 856. G. G. SWARD

**Oil absorption of pigments.** GOTTFRIED TRÖGER. *Farbe u. Lack* **1933**, 40–2, 55–6 65–7.—Review. G. G. SWARD

**The newer chemistry of coatings.** CARLETON ELLIS. *Ind. Eng. Chem.* **25**, 125–32 (1933).—The goal of recent research on coatings is to develop oils with greatly reduced drying time or to synthesize an ideal resin (properties given) to fill this need. Polymer theories of Staudinger and Carothers are outlined. Recent advances in the following classes of resins are discussed: polyhydric alc., phenolic (oil-sol.), polyvinyl, urea, depolymerized and chlorinated rubber, petroleum and heteropolymers, *e. g.*, from stilbene and maleic anhydride. Recent advances in solvents are *hydrogenation of petroleum* and *production of AcOH* from MeOH + CO and by the reaction $C_2H_2 + NaOH + H_2O \longrightarrow NaOAc + H_2$. A. M. COLLINS

**The effect of subjecting linseed oil to cold.** FELIX FRITZ. *Farbe u. Lack* **1933**, 79–80.—Review. G. G. SWARD

**Swelling and gas permeability of linseed oil films.** ANON. *Farben-Ztg.* **38**, 481–2 (1933).—Films of (1) linseed oil, (2) linseed oil plus 1%, (3) 2% and (4) 5% rubber, (5) linseed oil plus 2%, (6) 5%, and (7) 10% chlorinated rubber and (8) linseed oil-tung oil (3:1) were compared in respect to $H_2O$ absorption, and permeability to $SO_2$, $NH_3$ and HCl. Small amts. of rubber effectively reduce $H_2O$ absorption and permeability to the gases Chlorinated rubber is less effective, while tung oil is very effective. G. G. SWARD

**The optimum proportions of driers for linseed oil in the combinations lead-manganese, lead-cobalt, lead-manganese-cobalt.** K. WINIKER. *Farben-Ztg.* **38**, 504–5, 534–5(1933).—The most rapid drying times of linseed oil obtained by various drying metal combinations were 3 hrs. for Pb:Mn (7.5:1) with an abs percentage of Pb, 0.4–0.5%; 3 hrs for Pb:Co (5:1) with 0.5% Pb; and 1¾ hrs. for Pb:Mn:Co (10:1:2) with 0.5% Pb. G. G. SWARD

**Tung-oil yields.** B. F. WILLIAMSON. *Mfrs. Record* **101**, No. 17, 24 (1932).—A brief analysis is made of results obtained in expt. stations. A yield of 675 lb. of oil per acre is estd. for a grove at Gainesville, Ga. A. W. FURBANK

**Damar varnishes, yesterday and today.** C. HORNEMANN. *Farbe u. Lack* **1933**, 43–4.—The properties of damar resin are described and suitable uses are indicated. G. G. SWARD

**A correlation of color systems [for varnishes, oils, resins, nitrocellulose lacquers and transparent colored liquids].** G. G. SWARD AND J. R. STEWART. Am. Paint & Varnish Mfrs.' Assoc., *Circ.* No. **425**, 79–94(1933).—A no. of systems for describing the color of varnishes, etc., are reviewed and correlated. Solns. of $FeCl_3$ and $CoCl_2$ are suggested as standards. A set of 18 such solns. ranging in intensity of color from almost water white to that of a soln. of 3 g. $K_2Cr_2O_7$ in 100 cc. concd. $H_2SO_4$ is described. G. G. S.

**Service requirements of insulating varnishes.** R. H. ARNOLD AND L. E. FROST. *Ind. Eng. Chem.* **25**, 133–5(1933).—Dependability of elec. equipment depends on effi-

ciency of insulating varnish which, in addn. to dielec. strength, should be flexible and neither soft nor brittle at working temp. and should have high solids content and readily penetrate into coils, etc. Present tests (described), particularly accelerated ones, are in great need of improvement. A. M. COLLINS

**Metal for varnish kettles.** J. SOMMER. *Farben-Ztg.* **38**, 426–7(1933).—A no. of metals suitable for portable varnish kettles are rated for the properties, cost, durability, influence on color of varnish, ease of cleaning, when used both for the bottom and sides of the kettle. A combination of a Ni-plated ingot steel bottom and Monel metal sides ranked highest, while an Al bottom with Cu sides ranked lowest. G. G. S.

**The use of rubber resins in nitrocellulose lacquers.** A. KRAUS. *Farbe u. Lack* **1933**, 17–8, 28.—The plasticizing effects of 2 resins, typical of those extd. from guttapercha and balata, etc., in nitrocellulose lacquers were studied. The softer type (m. 63–5°) increased the elongation while the harder type (m. 84–5°) decreased the elongation of films of nitrocellulose:tritolyl phosphate:resin (1:1:1). Both types reduced the tensile strength of films both in the presence and absence of tritolyl phosphate. The use of the softer type in nitrocellulose leather lacquers is recommended. G. G. S.

**Modern lacquer finishing.** RAY C. MARTIN. *Metal Cleaning and Finishing* **4**, 555–8, 603–6, 610, 647 50(1932).—The characteristics of the various types of nitrocellulose, cellulose acetate and ethylcellulose employed in lacquers are briefly described The use of alc. solvents in nitrocellulose lacquers, the distinction between solvents and diluents and the desirable properties of nitrocellulose solvents are discussed D. T.

**Alcohols as lacquer solvents.** RAY C. MARTIN. *Metal Cleaning and Finishing* **5**, 27–30(1933).—The properties and application of BuOH, AmOH (refined fusel oil), EtOH (denatured alc.), anhyd alcs., MeOH, synthetic AmOH, *tert*-AmOH, *sec*-BuOH, *sec*-PrOH, butylcarbinol, methylpropylcarbinol, benzyl alc., furfuryl alc. and cyclohexanol as solvents in nitrocellulose lacquers are discussed. D. THUESEN

---

Apparatus and safeguards to health in nitrocellulose lacquer plants (CALVI) **9**. Rosin-wax sizes (LADOO) **23**. Genetic formation of substances. ---

**Paints.** ELISE E. LE ROUZIC and MARC PAQUIER. Brit. 365,121, July 12, 1929 Void. A process for decorating surfaces consists in applying liquids, charged with materials in suspension and having a viscosity increasing with evapn., so that as the liquid evaporates the suspended particles move by convection and are finally deposited as the liquid becomes viscous. Cellulose varnishes, varnishes with gums and resins as the base, and colloidal solns., *e. g.*, gelatin or agar-agar, may be used as liquids and powd metal or "Orient essence" as suspension.

**Anticorrosive paint.** KASPAR WINKLER. Brit. 365,366, Feb. 14, 1930. An anti-rust paint is made by mixing the smoke dust which is a by-product in the roasting of S ores, without further treatment, with linseed-oil varnish or other binding medium, with or without other substances, *e. g.*, lithopone, red lead, ultramarine. The dust may be that obtained from S ores contg. Pb and As.

**Appliance for mixing paints, etc.** WILLIAM LANGSDORF. Brit. 366,824, May 6, 1931.

**Grinding mills for paints, inks, enamels, etc.** JOHN H. HOLMES and G. M. S. ENGINEERING CO., SOC. ANON. Brit. 363,456, Oct. 23, 1930.

**Chrome-yellow pigments.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,362, Sept. 15, 1930. See Fr. 714,447 (*C. A.* **26**, 1809).

**Barium sulfate.** SACHTLEBEN A.-G. FÜR BERGBAU UND CHEMISCHE INDUSTRIE.

Brit. 363,936, Apr. 28, 1930. To produce coarsely cryst. $BaSO_4$, *e. g.*, for use in paints, the chemically pptd. compd. is heated at 300–1000° or over in the presence of not more than 10% of a fusion agent, *e. g.*, alkali oxide, hydroxide, chloride, etc. Cf. *C. A.* **26**, 2021.

**Titanium oxide-calcium sulfate composite pigments.** Willis F. Washburn and Leif Aagaard (to Titanium Pigment Co., Inc.). Brit. 364,112, Sept. 24, 1929. In the prepn. of $TiO_2$-$CaSO_4$ pigments by heating and hydrolyzing a mineral acid soln. of Ti salts contg. a suspension of $CaSO_4$, whereby the $TiO_2$ is pptd., the $CaSO_4$ is made by adding CaO, $Ca(OH)_2$, $CaCO_3$ or other Ca compd. to concd. $H_2SO_4$ Thus an aq. slurry of CaO is added to 78% $H_2SO_4$ and the resulting pulp is mixed while still hot with an acid soln. of ilmenite contg. 6% $TiO_2$ The mixt. is boiled and the resulting ppt. filtered, washed with $H_2O$ and ignited at 700–1200°.

**Drying oxidizable fatty oil and paints, etc., derived therefrom.** Resinous Products & Chemical Co. Brit. 363,394, Sept. 3, 1930. The drying is accelerated by incorporating multivalent metal salts of ketomonobasic acids of formula, RC:OR'COOH, in which R' is an aromatic nucleus and R an alkyl, aryl, cycloaromatic, polynuclear or heterocyclic radical, a C atom of which is attached directly to the C atom of the ketonic group. Metals specified are Cd, Cr, Sn, Hg, Cu, Al, etc , and especially Co, Mn and Pb. Examples are given of the prepn of such acids by condensing phthalic anhydride with $C_{10}H_8$, tetrahydronaphthalene, *p*-dichlorobenzene, pinene, ethylbenzene, diphenylene oxide, diphenyl ether and butyric anhydride. The use of salts of *p*-cymoyl-*o*-benzoic acid is especially claimed.

**Driers for oils, etc.** The Resinous Products & Chemical Co., Inc. Brit. 365,084, Sept 9, 1930. See Fr. 711,199 (*C. A.* **26**, 1810)

**Printing ink.** H. Zimmer. Brit 357,150, July 27, 1929. An oil base is incorporated with an aq. soln. of a dye by use of alkali, oil-sol. dyes, ppts. and pigments can be included as ingredients.

**Coating compositions.** British Celanese, Ltd. Brit. 365,093, Oct. 15, 1929. Lacquers, varnishes and coating compns are prepd. by incorporating a phenolallyl resin with a cellulose deriv , with or without the addn of solvents, plasticizers, softeners, other resins, fire retardants, etc The resins are made by condensing a phenolic substance, *e. g* , PhOH, a cresol or xylenol, with allyl alc., its org. or inorg. esters, *e. g.*, acetate, bromide or its ethers, *e. g* , allyl Et ether and diallyl ether, preferably in the presence of a catalyst. The cellulose deriv. may be an ester, *e. g.*, nitrate, acetate, butyrate or an ether, *e. g* , Et-, Me- or benzyl ether.

**Coating compositions.** British Celanese, Ltd. Brit 365,094, Oct. 15, 1929. Lacquers, varnishes and coating compns. are prepd by incorporating a cellulose deriv. with a synthetic resin made by condensing a hydroxyaromatic alc. with the reaction product of an aldehyde and glycerol or polyglycerol Plasticizers, softeners, coloring matters, etc., may also be present The hydroxyaromatic alcs., *e. g.*, hydroxybenzyl, hydroxytolyl or hydroxyxylyl alc., are preferably condensed at elevated temp. in the presence of an acid or alkali with an equimol. quantity of the aldehyde-glycerol.

**Coating compositions.** Soc. pour l'ind chim. à Bâle. Fr. 737,818, May 30, 1932. Suspensions of powd. condensation products of carbamide and aldehyde in water or org. liquids are applied to surfaces to be coated and are then dried and hardened by heat and pressure.

**Nitrocellulose coating composition.** Charles E. Burke (to E. I. du Pont de Nemours & Co.). U. S. 1,890,769, Dec. 13. An ethyl ether of pentaerythritol is used as a solvent or plasticizer.

**Coating surfaces.** Aktieselskapet Fredriksstad Saapefabrik. Brit. 365,628, Oct. 19, 1930. The interior surfaces of tanks to contain benzine, oil or other liquids are coated with a compn. of Na or K water glass and chalk to which fillers such as kieselguhr, asbestos powder, clay, cork or wood powder, etc., may be added. The coating is heated to harden it and render it resistant to water as well as oil.

**Apparatus and method for coating metal-pipe surfaces with flowable coating material.** National Tube Co. Brit. 363,703, Sept. 16, 1930.

**Artificial materials.** I. G. Farbenind. A.-G. Fr. 738,075, June 2, 1932. Oxidized drying oils such as linoxyn or oxidized wood oil are treated with $SO_3$ or its salts. The products are sol. in water and are rendered insol. by heating. They are used in making *varnishes, lacquers, linoleum*, etc.

**Polymerization products.** I. G. Farbenind. A.-G. Fr. 737,744, May 27, 1932. New products are made by the reaction of products of mixed polymerization contg. free OH groups, particularly those obtained from vinyl compds., with compds. capable of reacting with OH groups, particularly aldehydes or ketones. Thus the product obtained by combined polymerization of vinyl acetate and maleic anhydride is sapond.

and then heated with $CH_2O$, giving a product suitable for making *resistant lacquers*. Several examples are given.

**Refining rosin.** IRVIN W. HUMPHREY (to Hercules Powder Co.). U. S. 1,890,086, Dec. 6 For removing coloring substances from rosin, the latter is subjected, in soln. in a suitable solvent such as gasoline, to treatment with an org. ester such as monoacetin immiscible with the rosin soln. and having a selective solvent action on the coloring substances. Cf. *C. A.* **27**, 1503.

**Rosin size.** WM. H. HARDING and SIDNEY V. BURROWS (to Kalbfleisch Corp.). U. S. 1,890,462, Dec. 13. For making a size low in free rosin, a rosin size contg. more than 22% free rosin (as detd. by titration) is agitated in the hot, with a strong alk. soln. such as caustic alkali. App. is described.

**Decorating leather, wood, linoleum or other surfaces.** O. MAROTZ. Brit. 358,229, Sept. 10, 1930. A negative of a desired design is printed on paper with a colorless soln. of wax or resin and this design is then transferred to a leather or other surface by use of a hot iron or roller, and a coloring material is applied to the entire surface of the leather or other material being decorated, and the wax with its superposed coloring matter is finally removed from the surface. The process may be repeated for multicolor decoration, and various details of operation are given.

**Polyhydric alcohol-"polybasic" acid resin.** THEODORE F. BRADLEY (to American Cyanamid Co.). U. S. 1,890,668, Dec. 13. A toluene-sol. resin free from "monobasic" acid is prepd. from phthalic anhydride and a polyhydric alc. such as propylene glycol, trimethylene glycol or 2,3-butylene glycol by heating to about 290° for 2.5 hrs.

**Resinous condensation product.** ROY H. KIENLE (to General Elec. Co.). U. S. 1,889,923, Dec 6. A mono-glyceride of an oxidizable, unsatd. fatty acid such as the acid derived from linseed oil is blended with a drying oil such as linseed oil, and to this mixt. there is added "polybasic" org. acid material such as phthalic anhydride to combine with the free OH groups of the mono-glyceride and form a product which is suitable for molding, coating or insulating.

**Artificial resinous material from urea and formaldehyde.** WILHELM PUNGS, KARL EISENMANN and JOHANN KUCHENBUCH (to I. G. Farbenind. A.-G.). U. S. 1,889,791, Dec. 6. In the condensation of a urea and formaldehyde in the presence of an org. OH-contg. solvent such as EtOH, BuOH or iso-BuOH, the dispersion of the condensation products obtained is treated with steam, the resulting product is dried, and is subjected to fractional extn. with an org. solvent such as $C_6H_6$ or ethyl ether which is free from OH groups and is a low-boiling member of its class, which serves to sep. products of different characteristics.

**Synthetic resinous products.** ERNEST J. PIEPER (to Armstrong Cork Co.). Brit. 363,345, June 17, 1929. See U. S. 1,845,330 (*C. A.* **26**, 2334).

**Synthetic resins.** WM. J. SCHEIBER and PAUL F. SCHLINGMAN (to The British Thomson-Houston Co., Ltd.). Brit. 363,688, June 20, 1929. Void. Synthetic resins are prepd. by pptg. an aromatic amine-aldehyde condensation product in the presence of a suitable pulp during beating, at an elevated temp., whereby large particles of resin are produced which adhere to the pulp fibers. Temps. of 40–100° are used.

**Synthetic resins.** BAKELITE CORP. Brit. 363,694, June 18, 1930. Phenol-hexamethylenetetramine condensation products are made by acting on a phenol with $(CH_2)_6N_4$ (or mixts. of $CH_2O$ and $NH_3$) to produce a reactive resin and adding to the partially reacted ingredients a retarding agent, *e. g.*, natural resin, xylidines, toluidines, benzidine and (or) diphenylamine, and thereafter completing the reaction. When incorporated with fillers, *e. g.*, mica, molding mixts. are obtained yielding objects of very low phase angle difference and elec. power factor. The condensation products may also be *used for varnishes* and *impregnating purposes*.

**Synthetic resins.** H. A. BRUSON. Brit. 363,859, July 8, 1930. Rubber-like condensation products are formed by heating together a polyhydric alc. contg. 3 or more OH groups, castor oil and adipic, pimelic, suberic, azelaic or sebacic acid. Dihydric alcs., *e. g.*, glycol, and drying oils, *e. g.*, linseed, may be added to the reaction mass. The products may be used as plasticizers in cellulose nitrate and other lacquers and as bonding materials for rubber, asbestos, clay pigments, wood flour, etc.

**Synthetic resins.** ELLIS-FOSTER CO. Brit. 363,997, June 13, 1930. Water-sol. or dispersible synthetic resins or aq. solns. or dispersions thereof are made by treating a water-insol. or indispersible polyhydric alc.-polybasic acid resin, modified or not with monobasic acids or other agents, with an org. or inorg., preferably water-sol., base in the presence of $H_2O$, the base being in amt. sufficient to neutralize the excess acidity but insufficient to cause substantial sapon. or deresinification.

**Synthetic resins.** HUGH J. CAMERON and EDWARD H. JACKSON (to The British Thomson-Houston Co., Ltd.). Brit. 364,304, Dec. 13, 1929. A phenol-aldehyde condensation product, which is permanently liquid at ordinary temp. but solidifies on

heating, is produced by condensing a phenol and an aldehyde in presence of an ethanolamine, *e. g.*, mono-, di- or tri-ethanolamine, a dispersing agent and urea, the reaction mixt. being rapidly heated and subsequently rapidly cooled. In an example cresol 30, paraformaldehyde 18, triethanolamine 2, KBr 1 (dispersing agent), urea 0.5 and guanidine carbonate 0.5 parts are rapidly heated to 95–100° and then rapidly chilled to room temp. The liquid product may be used to impregnate, *e. g.*, an elec. coil. Cf. *C. A.* **27**, 616.

**Synthetic resins.** E. I. DU PONT DE NEMOURS & Co. Brit. 364,400, Feb. 19, 1931. A polymerized vinyl chloroacetate is caused to react with an alkali compd. of an org. acid, phenol or alc. in the presence of a non-reactive solvent in which the polyvinyl chloroacetate is sol., preferably an acetic ester. The products are substantially free from Cl and are useful for the manuf of protective finishes or as constituents of molding compns. Among examples, polymerized vinyl chloroacetate is treated with (1) Na Bu phthalate, (2) NaOAc in the presence of Bu acetate, (3) K phenoxide.

**Synthetic resins.** IMPERIAL CHEMICAL INDUSTRIES, LTD., WM. BAIRD and ROWLAND HILL. Brit. 364,737, Nov. 4, 1930. A polyhydric alc.-polycarboxylic acid condensation product contg. free OH groups equiv. to at least $^1/_3$ those originally present in the alc. is made by treating a polycarboxylic acid with an excess of polyhydric alc. or by treating a mutually satisfied alc.-acid condensation product of this type with a polyhydric alc., with or without the addn. of known alcoholysis catalysts. Cf. *C. A.* **27**, 1531.

**Synthetic resins.** FRAZIER GROFF (to The Bakelite Corp.). Brit. 365,100, July 6, 1929. Void. Potentially reactive resinous compns. are made by (1) heating a phenol with a fatty oil in the presence of a "promoter," *e. g.*, $H_3PO_4$, (2) treating the products of (1) with a further quantity of phenol and a methylene-contg. agent, (3) heating a phenol, tung oil, restricted amts. of a methylene-contg. agent and a catalyst, *e. g.*, a sulfonic acid deriv. Processes (2) and (3) yield mixed phenol-oil and phenol-methylene resins. Molding mixts, readily workable and remoldable, are obtained by incorporating filler.

**Synthetic resins.** ROY H. KIENLE and HARRY C. ROHLFS (to The British Thomson-Houston Co., Ltd.). Brit. 365,140, Sept. 16, 1929. Alkyd resins are made more flexible by prepg. them in the presence of a dibasic aliphatic acid ester, *e. g.*, glycol succinate, as such or made *in situ*. A cellulose ester may also be incorporated. The product may be dissolved for use in lacquers.

**Synthetic resins.** ISRAËL ROSENBLUM. Fr. 738,444, May 17, 1932. A fusible resin sol. in drying or semi-drying oils is made by condensing a phenol (PhOH, cresol, resorcinol, naphthol, etc.) with a compd contg. $CH_2$ such as $CH_2O$ in the presence of a terpenic or alicyclic alc. such as α-terpineol, borneol or dipentene. A harder resin is obtained by carrying out the condensation in the presence of a salt of Zn, Ca, Pb, Co or Mn. The condensation may be carried out in the presence of natural resins and if these contain free acids they may be esterified afterward with a polyhydric alc.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

**The solubility of fats in ethylene glycol monoethyl ether and in mixtures of this with petrolatum.** E. JAFFE. *Ann. chim. applicata* **22**, 667–73(1932); cf. *C. A.* **26**, 6167.—Cellosolve, $CH_2OHCH_2OEt$, has been used as a solvent for a large no. of fats in detg. the temp. at which the fat seps. out. The temps. varied from 15.4° for cacao fat to 57.8° for hydrogenated sperm oil. As the temp. of sepn. of many common fats is so low that they sep. as solids, a mixt. of 2 cc. petrolatum, 3 cc. of cellosolve and 1 cc. of fat was used. The temps. of sepn. with this mixt. are higher, 50–54° for nondrying or semidrying vegetable oils, 45–47° for drying oils. Castor oil is quite distinct, sepg. at 66.3°, and fish oils sep. at 52 to 54°. A. W. CONTIERI

**The action of microörganisms on fats.** L. B. JENSEN AND D. P. GRETTIE. *Oil and Soap* **10**, 23–7(1933).—A no. of species of bacteria, yeasts and molds may complicate the preservation of edible fat; and the organisms encountered in fats are not pathogenic. Microbic activity may cause fat spoilage by lipoclastic action and by discolorations due to chromogenic substances diffusing into the substrate. Cottonseed oil emulsion agar media may inhibit certain types of reducing bacteria because of the high active O content of many samples of old cottonseed oil. Certain types of oxidative rancidity may be caused by bacteria elaborating lipase which are also oxidase-peroxidase forming. The microbic content of old and rancid leaf lard, hydrogenated vegetable oil shortening and butter fat is shown by the use of Eijkman's original,

Lieske's emulsion agar, palm oil emulsion agar, Turner's cottonseed oil Nile blue agar, coconut oil emulsion agar and Eijkman's tallow plate combined with oxidase detection. The counts show the total nos. of lipoclastic bacteria and molds together with lipase-forming and oxidase-producing bacteria and molds. The presence of strict lipophilic microörganisms in plants is the exception and not the rule. E. SCHERUBEL

**Determination of oxidized fatty acids.** J. GROSSER. *Seifensieder-Ztg.* **60**, 49–50 (1933).—In the detn. of oxidized fatty acids by Fahrion's method in which they cling to the walls of the separatory funnel when the acidified soap soln. is shaken out with petr. ether, G. washes this residue with $H_2O$ and ashes it in order to remove all mineral constituents. P. ESCHER

**Oil and fat analysis by the thiocyanogen method.** W. S. MARTIN AND R. C. STILLMAN. *Oil and Soap* **10**, 29–31(1933).—The method is that of Kaufmann including all the modifications which expts. have shown desirable. Weigh the sample into a 125 cc. stoppered Erlenmeyer flask, add 25 ml. of a 0.2 *N* soln. of $(SCN)_2$ and keep the flask dark 24 hrs. at 65–70°F. The excess of $(SCN)_2$ should be 50–60%. After 24 hrs. add 1 g. dry powdered KI, rotate the flask 1.5–2 min., add 30 ml. distd. $H_2O$ and titrate the freed I with 0.1 *N* $Na_2S_2O_3$ soln., using starch as indicator. Run 3 blanks. If the titration of a 25 ml. portion of soln. drops more than 0.2 ml. of 0.1 *N* $Na_2S_2O_3$ in 24 hrs. the results will not be accurate. Thiocyanogen value = (blank titration × 12.69)/wt. of sample. This is expressed as percentage of I in order to put it on the same basis as the I no. For fats which contain no acids more unsatd. than linoleic the method offers a rapid way of estg. the proportions of oleic, linoleic and satd. acids. The method is particularly valuable for the analysis of fat mixts. contg. coconut and palm oils. E. SCHERUBEL

**Neutralization of oils and fats.** J. LEIMDÖRFER. *Seifensieder-Ztg.* **60**, 15–16, 34–5, 50–1, 66–7(1933).—1. Alkali methods. Free fatty acids are neutralized by passing moist $NH_3$ gas into the crushed oil seeds until the pressure becomes const. (Ger. pat 525,946, *C. A.* **25**, 4728) or by treating the benzine ext. with $NH_3$, NaOH or $Ca(OH_2)$. Anhyd. soaps are sol. in oil; hydrated soaps are not, the "break" of the finely divided soap in the refining process with NaOH is due to the absorption of $H_2O$ by the anhyd pptd. soap, and this coagulation is analogous to the sepn. into soap and lye in the salting-out process, if the temp. has been too high and little $H_2O$ is present, the sepd oil may, on cooling, even gelatinize on account of the soap dissolved in it. The color of cottonseed oil is 4-fold: (1) the unsatd fatty acids give the oil a yellow tinge; (2) impurities give it a brownish color; (3) some color is due to chlorophyll (green) or iron-chlorophyll (brown); (4) a red color results from absorption of albuminoid impurities. The red color is partly removed by an excess of NaOH during refining, the color passing into the neutral oil held by the pptd soap. Neutralizing with an alc $NH_3$ soln. (Wilhelm method) decreases oil losses and yields light-colored oils but requires distn. to recover the solvents. Neutralization with substances that do not dissolve oils, a new secret method, yields edible oils of light color. P. ESCHER

**The effect of varying conditions in the catalytic hydrogenation of fatty oils on the nature of the reaction product. II.** H. I. WATERMAN AND C. VAN VLODROP. *Rec. trav. chim.* **52**, 9–17(in English)(1933); cf. *C. A.* **26**, 5441. The hydrogenation of Me and Et linolates again indicates the effect of temp. on the reaction, high temps. (180°) favoring the formation of Me oleate and low temps. (65°) favoring the formation of Me stearate. Pressure is relatively unimportant. Anomalies in thiocyanogen values are mentioned. Linolic acid does not react with stearic acid to form oleic acid. J. V. VAUGHEN

**Analysis of sulfonated oils.** EDWIN R. THEIS AND JOHN M. GRAHAM. *J. Am. Leather Chem. Assoc.* **28**, 52–63(1933).—The Schindler method for sepg. sulfonated oils into neutral oil, free fatty acids and sulfated compds. (*C. A.* **24**, 4412) was applied to sulfonated neatsfoot oil to which was added variable wts. of neutral rapeseed oil and various fatty acids. The trend of the results as more neutral oil is added indicates that the sepn. gives low results for neutral oil and high results for the sulfated fraction. The following modified method gave better results: Dissolve the sulfonated oil in EtOH; ext. neutral oil and free fatty acids from the EtOH soln. with petr. ether in a Soxhlet extractor; det. unsaponifiable matter and free fatty acids in portions of the residue obtained by evapg. the petr. ether ext. Dil. the EtOH soln. with $H_2O$ and ext. unneutralized sulfated compds. and oxy-acids by shaking with $CCl_4$. Acidify the EtOH soln. and ext. neutralized sulfated compds. and sapond. fatty acids with $CCl_4$. H. B. MERRILL

**Vegetable oils by extraction.** A. THIEME. *Z. Ver. deut. Ing.* **77**, 45–7(1933).—Illustrated. Solvents used are: extn. benzine, $C_6H_6$, $CS_2$, $CCl_4$ and $C_2H_2Cl_2$. App. consist of: diffusion batteries, Böhm's continuous extn. app. and the Hansa-Mühle Hamburg continuous extractor. The latter is a bucket-elevator and spray arrange-

ment within a closed tank and is used for soy beans with a benzene-alc. (4:1) solvent; the dried extd. meal is used as *animal feed.* P. ESCHER

**Report of olive-oil committee.** M. F. LAURO. *Oil and Soap* **10,** 36(1933); cf. *C. A.* **26,** 4971.—The Bolton and Williams method for the grouping of fatty oils with reference to the detection of tea-seed oil in olive oil was tried out. The method consists in the detn. of the I nos. of the unsaponifiable matter of oils; and the values thus obtained cause the oils to fall into 4 groups: group 1, I nos. 64–70, kernel oils and animal fats; group 2, I nos. 90–96, fish and marine animal oils with cacao butter; group 3, I nos. 117–124, the vegetable oils and fats; and group 4, I nos. 197–206, olive oil alone, which is thus distinguished from other oils. As the result of coöperative work the method is shown to be inaccurate and an improved procedure of extn and washing is necessary to obtain data of value in the field of olive-oil adulteration. F. SCHERUBEL

**Technic in the recovery of oil from olives.** GIULIO PARIS. *Olii minerali, olii grassi, colori vernici* **12,** 187–8(1932). R. SANSONE

**Fish oils.** A. H. MENDONCA. *Official Digest Fed. Paint Varnish Production Clubs* No. **122,** 22–6(1933).—The source and magnitude of fish-oil production are briefly indicated. In a new plant of the F. E. Booth Co., fish oil is sepd. by centrifuge instead of settling tanks, is destearinated by refrigeration and freed from antioxygen amino compds. by chem. treatment. G. G. SWARD

**Studies in fish oils. II. The decolorization of pilchard oil.** H. N. BROCKLESBY AND L. P. MOORE. *Contrib. Can. Biol. Fisheries* **7,** 413–24(1933).—The effect of temp. and quantity of earth on decolorizing efficiency was studied. By a simple acid treatment, bentonite clay can be converted into an efficient decolorizing material. Acid earths tend to cause appreciable amts of hydrolysis, but in these expts. the optimal temp. of the earths used is below 150° and the amt. of hydrolysis found was negligible. Spectroscopic examn. of the bleached oils showed little, if any, preferential adsorption of pigments by the various earths used. F. L. DUNLAP

**Quality improvement of soap powders.** H. LEHMANN. *Seifensieder-Ztg.* **60,** 33–4 (1933).—The addn. of 15% of "Permulgin" to perborate soap powders decreases fiber destruction and improves lathering and cleansing properties P. ESCHER

**Perfumes for use in soaps.** PAUL JELLINEK. *Am. Perfumer* **27,** 187–9, 241–2, 293–4, 347–9, 401–4(1932). E. H.

---

Soaps and their latest competitors in the field of rayon improvement (STADLINGER) **25.** Dielectric constants of fatty oils (KOVALEV, ILLARIONOV) **10.** Use of vegetable oils as fuel for internal-combustion engines (SCHMIDT) **21.** Antioxidants (Brit. pats. 364,092 and 364,243) **30.** Emulsifying agents (Brit. pat. 365,299) **18.** Centrifugal oil cleaner (Brit. pat. 367,657) **1.**

**Extracting animal fats.** AKTIENGESELLSCHAFT FÜR CHEMISCHE PRODUKTE VORM. H. SCHEIDEMANDEL. Brit. 363,888, Feb. 13, 1930. In a process for producing glue and grease from bones by lixiviation with boiling water, a portion only, *e. g.*, 20–50%, of the phosphate of Ca in the bones is first extd. with acids, *e. g.*, HCl, $H_2SO_4$ or $H_3PO_4$.

**Stabilizing fats and oils against rancidity.** ROY C. NEWTON and WM. D. RICHARDSON (to Swift & Co.). U. S. 1,890,585, Dec. 13. A fat or oil such as lard or corn oil is treated with about 5–10% of palm oil rich in carotenoid pigment, the mixt. is treated with caustic alkali to remove free fatty acids and is then heated above the b. p. of water but below the temp. of decompn. to effect bleaching.

**Purifying oils, fats and waxes.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,025, Oct. 27, 1930. Org. O compds. consisting mainly of aliphatic alcs., fatty acids, fatty acid esters and aliphatic ketones and aldehydes are sepd. from non-aromatic hydrocarbons contg. at least 8 C atoms by treating the mixts. with liquid $SO_2$ at below 75°. On

standing 2 layers form, the upper being mainly hydrocarbons and the lower a soln. of the O compds. in the $SO_2$ from which they may be sepd. by evapn. or freezing.

**Refining mixtures of neutral oils and free fatty acids.** WILHELM GENSECKE. U. S. 1,889,652, Nov. 29. Material such as soapstock from oil refining is treated with an oil solvent such as benzene which is a non-solvent for soaps and the soln. is treated with a neutralizing agent to convert free fatty acids present into soaps; the soaps are sepd. from the soln. of oil and are washed with the oil solvent until they are substantially free from neutral oil, and the residual oil solvent is removed from the soap by distn. after converting the soaps in the mixt. into free fatty acids. Cf. *C. A.* **27**, 619.

**Soap.** JEAN M. A. DAVID. Fr. 737,945, Sept. 25, 1931. A washing and toilet soap contains black soap 50, $Na_2CO_3$ 25, $Na_2SiO_3$ 24 and vinegar 1%.

**Bleaching soap stock.** ANTHONY M. LAGASSE (to Stockton G. Turnbull). U. S. 1,890,121, Dec. 6. Soap stock is treated with $H_2O_2$ in non-alk. condition and excess $H_2O_2$ is decompd. after the bleaching operation is completed.

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

**J. A. Krajenbrink. Sketch of a pioneer's life.** O. POSTHUMUS. *Arch. Suikerind.* **40**, 1009–22(1932).—Biography with portrait. F. W. ZERBAN

**Annual synopsis of [sugar] mill data, 1930-31.** E. T. WESTLY. Philippine Sugar Assoc., *Ann. Repts.* **1931**, 291–307(1932). K. D. JACOB

**The sugar experimental section of the Polytechnic of Venice.** D. MENEGHINI *Ind. saccar. ital.* **25**, 530–4(1932).—The organization and purpose of the section are given with a review of the physicochem. problems of beet-sugar technology referred to in a selected bibliography. L. CUSACHS

**Preharvest sampling on plantations with much lodged cane.** S. STORM. *Arch Suikerind.* **40**, 1025–33(1932).—The Zeiss hand refractometer, in connection with the saccharimeter, has been used successfully in detg. the state of maturity of the cane as well as the rendement to be expected. A more elaborate method than that usually employed for collecting the sampling material must be used in the fields where much cane has lodged, and this is described in detail. The correlation with the actual mill results was greatly improved by it. F. W. ZERBAN

**Experiments on top borer control, 1930–31 [Java].** P. C. HART. *Arch. Suikerind* **40**, III, *Mededeel. Proefsta. Java-Suikerind.* 527–87(1932); cf. *C. A.* **20**, 3585.—Systematic cutting of affected sprouts reduces the damage to 0.25–0.5, and increases the sugar yield as much as 10–12 quintals per hectare. F. W. ZERBAN

**Final report on milling control, 1930 [Java].** ANON. *Arch. Suikerind.* **39**, III, *Mededeel. Proefsta. Java-Suikerind.* 245–315(1931).—Complete control data on the operation of the milling plant of 173 factories are given in tabular form and critically discussed, in comparison with previous yrs. F. W. ZERBAN

**Final report on milling control, 1931 [Java].** ANON. *Arch. Suikerind.* **40**, III, *Mededeel. Proefsta. Java-Suikerind.* 33–101(1932); cf. preceding abstr.—Corresponding data for 1931 are given. F. W. ZERBAN

**Final report on fabrication control, 1930 [Java].** C. SIJLMANS. *Arch. Suikerind* **39**, III, *Mededeel. Proefsta. Java-Suikerind.* 11–106(1931); cf. *C. A.* **24**, 6050.—Data for 176 factories are given and discussed. F. W. ZERBAN

**Final report on fabrication control, 1931 [Java].** C. SIJLMANS. *Arch. Suikerind* **40**, III, *Mededeel. Proefsta. Java-Suikerind.* 319–448(1932); cf. preceding abstr.—The same data for 173 factories are given with discussion. F. W. ZERBAN

**Final report on fuel control, 1930 [Java].** ANON. *Arch. Suikerind.* **39**, III, *Mededeel. Proefsta. Java-Suikerind.* 633–682a(1931).—Data for 170 factories are given with crit. discussion. F. W. ZERBAN

**Final report on fuel control, 1931 [Java].** ANON. *Arch. Suikerind.* **40**, III, *Mededeel. Proefsta. Java-Suikerind.* 483–526(1932); cf. preceding abstr.—Similar information is given for 170 factories. F. W. ZERBAN

**"Lystonol" as an antiseptic.** K. SMOLEŃSKI AND W. JUREWICZ. *Gaz. Cukrownicza* **69**, 367–77(1931).—"Lystonol," a French prepn. contg. $H_2O$ 72.82, NaCl 17.07, $ZnCl_2$ 8.03, HCHO 0.79 and impurities 1.29%, is a weak antiseptic. A 40% soln. of formalin is 20 times and phenol is 10 times more toxic than lystonol. The latter does not prevent decompn. of sugars when 50 g. of the preservative per ton of beets is used. J. WIERTELAK

**Approximate calculation of dry substance in molasses from Brix and sulfate ash.** C. SYLMANS. *Arch. Suikerind.* **40**, 993–1007(1932).—By a statistical analysis of data

on the compn. of a large no. of Java molasses it was found that the dry substance can be calcd. with good approximation, by multiplying the sulfate ash (uncor.) by a factor, and subtracting the product from the Brix, detd. in a diln. of 1:10. For molasses from the defecation process the above factor is 0.72, sulfitation 0.86, carbonatation 0.74. For the 1st group the error ranges from —1.5 to +1.7, and does exceed 0.6 in 82.1% of all cases; in the 2nd these figures are —1.2, +2.4, 87.1%; in the 3rd —0.8, +1.2, 91.4%. No correlation could be found when refractometer Brix was substituted for hydrometer Brix F. W. ZERBAN

**Destruction of sucrose in "A" molasses by heat.** R. H. KING AND N. L. JISON. *Sugar News* **14**, 24–7(1933).—Portions of molasses of 80° Brix, 53.8 gravity purity. $p_H$ 6.00, were heated 36 hrs. under reduced pressure at different temps. and samples were analyzed at 4-hr. intervals. Distd. water was added to compensate for evapn. Graphs and tabulations show that: when the temp. difference between the salt bath and the molasses is increased from 10° to 20° greater decompn. occurs; below 70° little sucrose is lost; at 90° the loss is considerable; the increase in reducing sugars is accompanied by a loss in total sugars; higher boiling rates cause more volatile acid to go off, and more carbon dioxide is given off in the presence of air. The prolonged heating of molasses and the use of high-pressure steam in pan boiling are condemned. L. C.

**Plant colloids. XXXI. Determination of the mean particle size of some starches and starch derivatives.** M. SAMEC, L. KNOP, B. LAVRENČIČ AND S. PREMRL. *Kolloid-Beihefte* **37**, 91–118(1932); cf. *C. A.* **26**, 619, 4524.—From osmotic pressure and diffusion measurements on a starch completely sol. in water the mean particle size is equiv. to 28–38 hexose groups, agreeing with the figures of Haworth, *et al.* (*C. A.* **26**, 5922). For erythroamylose the particles were larger, contg. about 100 hexose groups; the blue color with I is therefore not dependent upon mol. size. The achroödextrin particles contained 8–16 hexose groups. F.-p. depression measurements on acetylamylose gave no reliable results, the figures depending on the method of prepn. In general, f.-p. depression measurements gave, for all the derivs. tried, mol. wts smaller than by other methods, probably on account of persistent traces of impurities. For the isotrihexosan of Pictet the mol wt. by diffusion or osmotic pressure methods was 1700–2400, by f.-p. depression or isothermal distn. 441–572. For isodihexosan the corresponding figures were 1250–1400 and 361, resp. In each case the values were lowered by drying and raised again on re-wetting and again drying. The tendency of the various starch derivs. to produce aggregates in soln. cannot be considered as true reversion to the original starch particles. Heating of acetyl derivs of amylose or amylopectin with $C_{16}H_8$ or $PhSO_3H$ gave varying degrees of disaggregation, the products having mol. wts. of 400–1600. K. V. THIMANN

**Absence of fatty acids associated with potato starch.** LEO LEHRMAN AND ELVIN KABAT *J. Am. Chem. Soc.* **55**, 850(1933).—Potato starch does not contain fatty acids assocd. with it and is the best whole starch to use as carbohydrate. C. J. WEST

Sugar-cane culture in Java (BOOBERG) **15.** Results of the plot tests on various [sugar-cane] problems, in 1931 (DEMANDT) **15.** Results of the fertilizer tests [on sugar cane] in 1931 (DEMANDT) **15.** Effect of plant-nutrient substances on the sugar content of sugar beets (ROSENDLČH) **15.** *Cercospora* control in Monzon (COSTA) **15.** Soil mapping on the basis of color and consistency (BRINK) **15.** Physiology of nutrition of the sugar cane (VAN DEN HONERT) **15.**

---

**Purifying sugar juices.** SUGAR BEET AND CROP DRIERS, LTD., and THOMAS J. MITCHELL. Brit. 364,635, Oct. 8, 1930. See Fr. 723,859 (*C. A.* **26**, 4978).

**Tank, agitators and air-draft connections of sugar-crystallizing apparatus.** DUDLEY A. WALSH. U. S. 1,890,632, Dec. 13. Structural and mech. details.

## 29—LEATHER AND GLUE

ALLEN ROGERS

**Salting hides with soda-salt.** MAX BERGMANN AND GERTRUD SCHUCK. *Ledertech. Rundschau* **24**, 41–2(1932).—Hide salt should contain 2% calcined or 5% cryst. soda. If $x$ % $CaSO_4$ is present it is necessary to add $(2 + 0.75x)$ % calcined soda. H. M. BERGMANN AND L. SELIGSBERGER. *Ibid* 73–6.—Motion similar to that in a railway car caused partial sepn. or settling out of calcined or effloresced but not of cryst. soda from a soda-salt mixt. I. D. CLARKE

**Report on practical salting experiments in 1931.** M. BERGMANN AND W. HAUSAM. *Ledertech. Rundschau* **24**, 121–5, 133–6(1932).—Calfskins salted flesh to flesh were more

stained than those salted hair to flesh. Addn. of 2% soda to the salt decreased salt stains and reddening but not the development of the violet stain. Addn. of 3% naphthalene to the soda-salt mixt. decreased red and violet stains but had only a slight effect on salt stains. I. D. CLARKE

**Effect of various additions to marine salt for use as a cure for hides and skins.** A. GUTHRIE AND M. SUBRAMANIYA SASTRY. *J. Intern. Soc. Leather Trades Chem.* **17**, 50–6(1933).—"Atlas preservative," $H_2C_2O_4$, $ZnCl_2$ and $NaSiF_6$ were increasingly effective in the order named in preventing "red heat" and putrefaction. "Perchloron," $NaHSO_3$, $NaHSO_4$ and $Na_2CO_3$ were ineffective. The acidic preservatives, especially $H_2C_2O_4$, induced the formation of black stains. H. B. MERRILL

**The reuse of used hide salt.** MAX BERGMANN AND WILLI HAUSAM. *Ledertech. Rundschau* **24**, 26–7(1932).—Old salt should not be reused, because it contains bacteria and eggs of flying insects. I. D. CLARKE

**Statistics on tanning materials and tanning extracts from the Deutschen Versuchsanstalt für Lederindustrie, Freiberg.** F. STATHER. *Ledertech. Rundschau* **24**, 111–13, 136–7(1932.)—Summary of tannin analyses made during 1927–31. I. D. C.

**Characteristics of vegetable tanning materials. I. The diffusion of chestnut and quebracho tannins into animal hide.** FRITZ STATHER *Collegium* **1933**, 9–22.—Depth of penetration of tannin into hide was detd. by examn. of frozen sections stained with $K_2Cr_2O_7$. Penetration increased and relative penetration decreased with increasing concn. (0.5 to 4%) of tannin. Penetration increased with increase in temp. (20° to 40°), increase in $p_H$ of the tannin soln. (2.1 to 6.1 for chestnut and 2.4 to 8.3 for quebracho), slightly with increase in $p_H$ of the hide (4.5 to 7.5) but was not changed by increasing the ratio of nontannin to tannin. I. D. CLARKE

**Mutual work of the commission on qualitative tannin analysis. Detection of sulfite cellulose extract by the aniline-hydrochloric acid, the cinchonine and the quartz-burner reactions.** O. GERNGROSS AND H. HERFELD. *Collegium* **1932**, 710–23; cf. *C. A.* **26**, 2343.—Eighteen exts. were examd. by 12 collaborators. The percentages of correct results were: aniline-HCl reaction 78.2%, modified aniline HCl 91.7%, cinchonine reaction, new, 87%, old 88.9% and the fluorescence test 69.7%. I. D. CLARKE

**Influence of the method of boiling and purification of sulfite cellulose extracts on their detection in vegetable tanning extracts.** O. GERNGROSS AND H. HERFELD. *Collegium* **1932**, 723–5; cf. *C. A.* **26**, 4501 and preceding abstr. Previous history of sulfite cellulose exts. had no influence on the min. amt. detectable by the Procter Hirst or cinchonine reactions. I. D. CLARKE

**Practical experiences with animalized cotton for testing tanning materials.** A. GANSSER. *Collegium* **1932**, 771–5.—See *C. A.* **27**, 1229. I. D. CLARKE

**Acid flocculation phenomena in vegetable tanning extracts.** O. GERNGROSS AND H. HERFELD. *Collegium* **1932**, 679–709. By cautious addn. of mineral acid to tech. tanning solns. of analytical concn. it was found that condensed tannins, except mimosa, had a characteristic flocculation or pptn. point somewhere between $p_H$ 7 and 1 (in 0.5 hr.). Hydrolyzable tannins did not ppt. The first pptn. fraction was dominately hydrophobic; later fractions were more hydrophilic. Acid flocculation is valuable for judging colloidal condition and in qual. and quant. tannin analysis. Since many tannin exts., clear at $p_H$ 7, begin to ppt. at $p_H$ 4.1–4.3, detn. of insolubles should be made at $p_H$ 4.5–5.0, and the time factor should be carefully controlled. Higher concns. of liquor ppt. more readily. Org. acids differ from inorg. acids in that at higher concns. of acid the org. anions have a peptizing action on the tannin. On aging condensed tannins there is a continual increase in sol. tannin coagulable by acid, but not in hydrolyzable tannins. Mechanically clarified and sulfited exts. are more difficult to ppt. than untreated exts. Sulfite cellulose ext. is quite stable and decreases the pptn. of vegetable tannins. I. D. CLARKE

**Nature of the combination of wattle-bark tannin with collagen.** R. W. PAGE. *J. Am. Leather Chem. Assoc.* **28**, 93–113(1933); cf. *C. A.* **23**, 541, **25**, 2326; **26**, 3404. Evidence is cited to show that the so-called "fixed tannin" of the hide substance-wattle tannin leather is combined with basic groups of collagen by primary valence, while the so-called "fixed $H_2O$-sol. matter" is combined with CO groups by secondary valence. H. B. MERRILL

**Wattle bark from South Africa.** ANON. *Bull. Imp. Inst.* **30**, 440–4(1932).—Mature black wattle bark from Natal contained slightly more tannin (35.6%) than immature (33.5%); mature green wattle bark contained appreciably more tannin (38.1%) than immature (29.5%). Leathers tanned with the green wattle barks were not quite so close-grained as those produced with the black wattle samples, and were of a decidedly pinker tint. A sample of black wattle bark from Southern Rhodesia was of satisfactory

compn. (tannin 33.2, non-tannin ext. 8.1, insol. 46.8%), but was of unattractive appearance on account of faulty drying. A. PAPINEAU-COUTURE

**Terminalia pallida as a tanning agent.** K. SESHACHALAM CHOUDARY. *J. Intern. Soc. Leather Trades Chem.* **17,** 68–70(1933).—The pods contain about 20% and the bark about 14% tannin. Tannin loss on fermentation is about the same as with *T. Chebula* (myrobalams), but less acid is produced. H. B. MERRILL

**Determination of the $p_H$ values of tanning extracts. Committee report.** D. BURTON, *et al. J. Intern. Soc. Leather Trades Chem.* **17,** 57–9(1933).—$p_H$ values of 5 exts. were detd. by 4 operators using different glass-electrode set-ups and by 1 operator with the H electrode. Satisfactory concordance was obtained except with a bleaching ext. contg. $SO_2$, in which the H electrode $p_H$ value was very low and the glass electrode values varied by 0.4 $p_H$ unit, probably because of variable loss of $SO_2$. H. B. M.

**Retanning.** TH. WIESCHEBRINK. *Ledertech Rundschau* **25,** 1–7(1933).—Discussion of the principles of retanning with barks and exts. I. D. C.

**Studies in the chemistry of liming. V. Action of calcium hydroxide suspensions on steer hair.** E. K. MOORE AND R. KOPPENHOEFER. *J Am. Leather Chem. Assoc.* **28,** 64–77(1933); cf. *C. A.* **26,** 2888. Hair was treated with satd. $Ca(OH)_2$ soln. contg. excess $Ca(OH)_2$ at about 20° for varying time periods (1) in air, and (2) in $N_2$. Used liquors were analyzed for total N, $NH_3$, total S ($S^{--} + SH^-$), polysulfide, $SO_3^{--}$ and $SO_4^{--}$. Tests for dissolved cystine or cysteine were neg. in all cases. Total N increased irregularly with time and was about the same in the presence or absence of $O_2$. $NH_3$ increases regularly with time, independently of the presence of $O_2$. Total S increases more rapidly in the presence of $O_2$, but $S^{--}$, $SH^-$ and polysulfides increase more rapidly in the absence of $O_2$. Only traces of $SO_3^{--}$ were found in any case. The different forms of S detd. account for only 20–40% of the total S in the used liquors. About 20% of the S content of the hair is dissolved. Mol. ratio of dissolved S to dissolved N is roughly 1:1. H. B. MERRILL

**The influence of the liming process on water penetrability.** MAX BERGMANN, WILHELM VOGEL, ARTHUR MIEKELEY, GERTRUD SCHUCK AND THEODOR WIESCHEBRINK. *Ledertech Rundschau* **24,** 13–18(1932). Resistance to penetration by $H_2O$ of experimentally limed and tanned sides was greater with a strong sulfide lime for a short time than with a straight lime. I. D. C.

**Liming of fellmongered sheep skins.** ROBERT H. MARRIOTT. *J. Intern. Soc. Leather Trades Chem.* **17,** 60–8(1933).—Microscopic study of fellmongered sheep skins dewooled (1) with sulfides and (2) with $Ca(OH)_2$, before and after reliming indicates some deterioration with both classes of stock. H. B. MERRILL

**Investigations on the fat-liquoring process. II. The behavior of sulfonated castor oil in fat-liquoring chrome leather.** F. STATHER AND R. LAUFFMANN. *Collegium* **1932,** 672–9; cf. *C. A.* **26,** 6178.—Dilu. of the fat liquor caused no change in total fat absorbed by the hide powder tanned with Cr but caused an increase in combined fat, a decrease in alc. ext. and no change in petr. ether ext. Aging or an increase in temp. during aging of the tanned hide powder did not change total fat or alc. ext. but increased combined fat and decreased petr. ether ext. With increasing degree of neutralization of the tanned hide powder there was first a slight increase in combined and total fat then a sharp decrease. **III. Fat-liquoring chrome leather with mixtures of sulfonated castor oil and unsulfonated oils.** *Ibid* 940–6.—Hide powder tanned with Cr was fat-liquored with mixts. of sulfonated castor oil (degree of sulfonation 34 and 62) and unsulfonated castor, train, neatsfoot or mineral oils. The amt. of sulfonated oil in the mixt. was 100, 75, 50 or 25%. The amt. of total fat absorbed was approx. const. The degree of sulfonation was without influence on the results. Combined fat decreased as the proportion of sulfonated oil decreased and apparently would become 0 with no sulfonated oil. As the proportion of sulfonated oil in the mixt. decreased, the petr. ether ext. of the leather increased rapidly and the alc. ext. decreased slightly. There was no appreciable difference in results with the 4 unsulfonated oils. I. D. C.

**Anarol and Ovarol.** M. AUERBACH. *Ledertech Rundschau* **24,** 103–5(1932).—Analyses and description of 2 leather oils. I. D. C.

**Preparation of leather for chemical analysis.** FRITZ STATHER. *Ledertech. Rundschau* **24,** 63–4(1932).—Description of a machine similar to that of Balderston (*C. A.* **17,** 1901). I. D. C.

**Evaluation of vegetable-tanned leather on the basis of its chemical and physical analysis.** FRITZ STATHER. *Ledertech. Rundschau* **24,** 85–90, 97–101(1932).—Discussion of normal values and the significance of abnormal values for the various detns. in leather analysis. I. D. CLARKE

**Dyeing chrome-tanned velvet calf leather black.** GUSTAV WEISZ. *Ledertech. Rundschau* **24,** 27–9(1932).—Directions are given. I. D. C.

**New ways of stuffing leather. II.** HEINTZ KROCH. *Ledertech. Rundschau* **24,**

113–16(1932).—The softening effect of oil on leather depends on esters of the oleic acid series. I. D. CLARKE

**Influence of milling soaked sheep skins on the properties of the leather.** A. E. SHAPIRO. *Collegium* **1933**, 22–3.—Very soft, flexible leather was not made by milling but by long soaking and strong sulfide limes. I. D. CLARKE

**Development of brittleness and hardness in shoe-upper leather during wear.** FRITZ STATHER AND HERMANN SLUYTER. *Ledertech. Rundschau* **24**, 49–55(1932).—Typical substances which might be introduced into upper leather during wear, dil. NaOH, $MgSO_4$, dextrin and $FeSO_4$, lowered tensile strength and stretch somewhat but principally caused a great decrease in stretchiness of the grain. Cr leather was less affected than vegetable leather. I. D. CLARKE

**Some results with a new folding endurance tester for light leathers.** I. D. CLARKE AND R. W. FREY. *J. Am. Leather Chem. Assoc.* **28**, 77–92(1933). H. B. M.

**The swelling of collagen fibers. Determination of the value of bates.** J. A. JOVANOVITS. *Collegium* **1932**, 761–71; cf. *C. A.* **26**, 6178.—A collagen fiber, either fresh or soaked if salted, 0.04–0.06 mm. thick, from the forepart of a bull hide, is fastened between clamps. The lower clamp, weighing 0.3 g., is free. The fiber is put in $H_2O$ at 40° for 5 min., shrunk in $H_2O$ at 80° for 1 min. and, after adjusting the distance between the clamps to 2 cm., is immersed in unfiltered, stirred bate soln. at 40° and the time noted until the lower clamp falls. The "fiber test value" is that concn. of bate which digests the fiber in 10 min. I. D. C.

**The isoelectric point of collagen.** M. SHIMIDZU. *Collegium* **1932**, 794–8.—Fresh collagen powder, powdered after freezing in liquid air, had a $p_H$ of 4.69. This was detd. by pptn. tests with colloidal Fe (+ charge) and Au (−) sols and collagen buffered with acetate at different $p_H$ values. I. D. CLARKE

**The so-called rope damage and the present state of the stain question.** M. BERGMANN, W. HAUSAM AND E. LIEBSCHER. *Collegium* **1933**, 2–5.—Hair-mold stains, a term preferable to salt stains, may be formed either on the living skin or after flaying. Used salt caused typical stains in one case. I. D. CLARKE

**New methods in defatting bones.** J. WETZLER. *Kunstdünger u. Leim* **29**, 398–405(1932).—Recent developments are outlined in low-temp. drying and grease extn. by solvents in prepn. for gelatin and glue manuf. C. J. SCHOLLENBERGER

**The quality of fish glues—notes on their physical examination.** D. JENNINGS. *Chem. Trade J.* **92**, 105(1933).—The permanence of liquid glue depends chiefly upon its chem. compn. The liquid should be slightly acid to phenolphthalein but neutral to litmus. Color and odor, "gel point" and joint strength, viscosity and rate of drying are detg. factors in the selection of a glue. Liquid fish glues should never contain more than 0.2% NaCl. The greater hygroscopic nature of chlorides of Ca, Mg and Zn renders them even more detrimental than NaCl. W. H. BOYNTON

Conductomeric analysis. Tan liquors and leather extracts (RIGHELLATO, DAVIES) **7.** Cr-containing dyes [for leather] (Brit. pat. 364,147) **25.** Sulfurized phenols [with tanning properties] (Brit. pat. 365,534) **10.** Wetting, etc., agents (Brit. pat. 364,660) **18.** Treatment of leather (Brit. pat. 364,327) **25.**

RADIC, IVAN: **Über die nach verschiedenen Methoden erhaltenen Werte der Oberflächenspannung mehrerer pflanzlicher Gerbstofflösungen und über die Beziehung der Oberflächenspannung zur Adstringenz der Gerbstoffe.** Thesis, Darmstadt, 1930. 83 pp.

---

**Degreasing skins and leather.** OSCAR L. BEER. Fr. 738,167, June 4, 1932. Skins and leather of all kinds are degreased by salts of synthetic tanning materials obtained from aromatic, hydroaromatic or aliphatic compds. contg. in their mols. groups capable of forming salts. Examples are given of the use of a Na salt of a compd. prepd. from aromatic hydroxysulfonic acids and $CH_2O$, $S_2Cl_2$ or $POCl_3$, Na salts of PhOH-$CH_2O$ condensation products, salts of sulfonated chloronaphthalene which have been converted into sol. condensation products by treatment with $CH_2O$, Na salt of the condensation product of 2,5,7-aminonaphtholsulfonic acid and toluenesulfochloride, etc.

**Enameling vegetable or animal fiber.** JACQUES GALIMBERTI AND JOSEPH PIVERELLI. Fr. 737,412, May 21, 1932. The material to be enameled, *e. g.*, leather, is covered with a layer of a paste of ground rubber and rubber latex mixed with coloring materials, on which layer is deposited an emulsion contg. latex, a drying oil, resin, casein dissolved in aq. $NH_3$ and formalin, and the whole is vulcanized in the cold in the presence of $S_2Cl_2$.

**Uniting rubber with leather.** ARTHUR V. THOMAS (to E. H. Clapp Rubber Co.) U. S. 1,890,345, Dec. 6. After the leather is dried at a moderate temp., one of its surfaces

is coated with a vulcanizable cement; a rubber compn. is applied to the coated surface while the leather is relatively cool, a pad of textile material is placed against the opposite side of the leather and the assembled materials are inserted in a vulcanizing press.

## 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

**Slate flour as a filler in the rubber industry.** JUL. F. SACHER. *Gummi-Ztg.* **47**, 439(1933).—Slate flour from the Rhineland is recommended as a filler. It consists chiefly of a mixt. of clay, mica, quartz and org. and inorg. impurities. C. C. D.

**The preparation and properties of a natural mineral black.** M. W. PHILPOTT. *Trans. Inst. Rubber Ind.* **8**, 270–8(1932).—Since the tests of No. Devon mineral black originally described by Schidrowitz and P. (cf. *C. A.* **25**, 232, 3870), periodical tests have shown that the superior reënforcing power of refined black is not due to the higher C content. Higher tests than previously have been obtained with a new black prepd. by grinding and screening the product from drying a strained thick aq. cream of the black made alk. with NaOH. The rate of vulcanization is also greater with this type of black than with those blacks which are not alk. Within fairly wide limits, variations in the alky. of the black before drying do not affect the uniformity of the final product. The com. method of prepn. and the properties of the new product, called "Bettablack," are described. C. C. DAVIS

**Sulfur-free ureas and guanidines as vulcanization accelerators and theories.** RUDOLF DITMAR. *Kolloid Z.* **62**, 117–21(1933).—A patent review. A. FLEISCHER

---

The use of rubber resins in nitrocellulose lacquers (KRAUS) **26.** Protection against corrosion by coatings with a base of rubber (SACHS) **9.** Structural viscosity [in rubber sols] (GALLAY) **2.** Polymerization processes and apparatus (Brit. pat. 365,102) **10.** Uniting rubber with leather (U. S. pat. 1,890,345) **29.**

STEVENS, H. P., AND STEVENS, W. H.: **Rubber Latex.** 2nd ed. London: Rubber Growers' Assoc. 158 pp. Free. Reviewed in *Rubber Age* (London) **13**, 342 (1933).

---

**Jelling rubber latex.** CECIL HAYES, EVELYN W. MADGE and FREDERICK C. JENNINGS (to Dunlop Rubber Co., Ltd.). U. S. 1,890,578, Dec. 13. Latex is treated with phenol, and sufficient formaldehyde is then added to reduce the alky. of the latex without coagulating it.

**Rubberized fibers.** THE NAUGATUCK CHEMICAL CO. Fr. 738,087, June 2, 1932. Fibrous or filamentous material is dipped into a dil. aq. dispersion of rubber, which is then coagulated in the material, giving a discontinuous deposit of particles invisible to the eye.

**Conditioning rubber.** GUMAL FESSEL (to Technische Chemikalien-Compagnie G. m. b. H.). U. S. 1,889,825, Dec. 6. Rubber is conditioned for the manuf. of vulcanized products by mixing the rubber with an ext. obtained by extg. tars, originating in the distn. of bituminous minerals, with solvents such as EtOH, MeOH, EtOAc or acetone and then removing the solvent from the ext. The added ext. serves as a softener and anti-aging ingredient.

**Chlorinated rubber.** I. G. FARBENIND. A.-G. Fr. 738,434, Mar. 29, 1932. A sol product is obtained by treating with Cl or substances liberating it, rubber dissolved in $CCl_4$, $C_2H_2Cl_4$, $C_2Cl_6$, $CHCl_3$, etc., in the presence of a substance indifferent to Cl such as $Na_2CO_3$, $NaHCO_3$, $CaCO_3$, CaO, MgO, AcONa, etc. The products are used in making *varnishes, paints, plastic materials, films, etc.*

**Articles from rubber emulsions.** SOCIETÀ ITALIANA PIRELLI. Brit. 365,037, Sept. 13, 1929. See Fr. 701,406 (*C. A.* **25**, 4149).

**Molding organic substances.** DUNLOP RUBBER CO., LTD., ANODE RUBBER CO., LTD., DOUGLAS F. TWISS and EDWARD A. MURPHY. Brit. 363,660, Sept. 22, 1930. Master molds and articles produced therefrom are made from natural or artificial dispersions of rubber or other natural resins in non-vulcanized or vulcanized condition, synthetic rubbers and rubber-like substances in non-compounded or compounded condition, or solns. of these substances in org. solvents. The molds are first coated with the substance, which is then treated, *e. g.*, by the process of Brit. 324,988 (*C. A.* **24**, 3925), to cause localized irregularities or wrinkling in the surface layer, the marking being rendered permanent by subsequent or concurrent solidification.

**Preserving rubber.** MISHAWAKA RUBBER & WOOLEN MANUFACTURING CO.

Brit. 365,374, Mar. 17, 1930. Unvulcanized strips of sheet rubber are manipulated by winding them with a strip of supporting material in such manner that each convolution of the rubber is held out of contact with the support on its outer side. App. is described.

**Antioxidants.** Goodyear Tire & Rubber Co. Brit. 364,092, Oct. 12, 1929. Antioxidants for rubber, oils, soaps, aldehydes and other oxidizable org. compds. have the formula $RCH_2R'NH_2$ (where R is either an anilino, an amino-substituted anilino, an alkyl-substituted anilino, an aminoalkyl-substituted anilino, an alkylamino-substituted benzene or an amino-substituted benzene group and R′ is an alkyl-substituted benzene, an amino-substituted benzene or an alkylamino-substituted benzene group) and are prepd. by treating the reaction product of arylamines and aldehydes with amine hydrochlorides. Examples are *p*-aminobenzylaniline (I) and 6,4,4′-triamino-3,3′-dimethyldiphenylmethane. I is prepd. by the reaction of $PhNH_2$ with $CH_2O$, the oily product formed (*N*,*N*′-diphenylmethylenediamine) being then treated with $PhNH_2$·HCl.

**Antioxidants.** Werner M. Lauter (to Goodyear Tire & Rubber Co.). Brit. 364,243, Jan. 13, 1930. Antioxidants for rubber or other oxidizable org. compds., *e. g.*, transformer oils, soaps, are made by reaction of an aminoacenaphthene with an aldehyde or formic acid in soln. in alc., petroleum ether or other solvent, if necessary with refluxing of the mixt.

**Antioxidants for rubber.** Joseph R. Ingram (to Rubber Service Laboratories Co.). U. S. 1,890,154, Dec. 6. Vulcanization of rubber compns. with S by heating is effected in the presence of a reaction product (suitably about 1%) of an amino-substituted triphenylmethane and an aromatic hydrocarbon, in which one or more H atoms are substituted by OH groups only, such as a reaction product of *p*,*p*-diaminotriphenylmethane and β-naphthol.

**Synthetic rubber.** I. G. Farbenindustrie A.-G. Brit. 363,810, Dec. 11, 1930. The polymerization of diolefins by alkali or alk. earth metals or their alloys with one another in presence of H is effected in the absence of org. compds. contg. O. Indifferent gases, *e. g.*, N, $CO_2$, may be present.

**Synthetic rubber.** I. G. Farbenindustrie A.-G. Brit. 364,089, Aug. 21, 1930. In the polymerization, *e. g.*, at 10–20°, of diolefins in emulsion in the absence of hydrazine derivs. or salts thereof the process is arrested when the amt. of polymerizate sol. in $C_6H_6$ attains a max., which usually occurs when 20–30% of the diolefin remains unpolymerized. Other polymerizable compds. may be present, also hydrocarbons other than diolefins. Catalysts, *e. g.*, O, $H_2O_2$ and also colloidal substances, *e. g.*, albuminous substances, resins, rubber, may be employed, and the process may be terminated by coagulation with acids.

**Vulcanization accelerators.** Robert L. Sibley (to The Rubber Service Laboratories Co.). Brit. 363,644, Oct. 2, 1929. A mixed accelerator consists of a reaction product of a dinitrohalo-substituted aryl hydrocarbon and a mercaptoarylthiazole or metallic salt thereof together with a Schiff's base or an aliphatic aldehyde deriv. thereof. Among examples 2,4-dinitrochlorobenzene is caused to react with the Na salt of mercaptobenzothiazole and used in conjunction with the compd. formed by the reaction between 3 mols. of AcH and 2 mols. $PhNH_2$. Cf. *C. A.* **27**, 1547.

**Preserving and accelerating vulcanization of rubber.** Imperial Chemical Industries, Ltd. Brit. 365,493, July 24, 1930. To retard aging and accelerate vulcanization a salt of a primary aromatic amine of an aromatic carboxylic acid or aliphatic di- or tri-carboxylic acid is added. As amines diphenylenediamine, naphthylenediamine, benzidine, toluidine and dianisidine, and as acids benzoic, phthalic, naphthalic, oxalic, malonic, tartaric and citric may be used.

**Rubber vulcanization.** Winfield Scott (to Rubber Service Laboratories Co.) U. S. 1,890,165, Dec. 6. The sulfurized butyraldehyde deriv. of butylideneaniline is used as an accelerator in vulcanizing with S by heating. Cf. *C. A.* **27**, 1238.

**Vulcanizable composition resembling rubber.** Joseph C. Patrick and Nathan M. Mnookin. U. S. 1,890,231, Dec. 6. A high-S plastic contains additive polysulfides of olefins together with rubber and S, the total proportion of S uncombined and combined with the rubber and in the olefin plastic being not substantially less than 50%.

**Rubber vulcanization.** Wm. E. Messer (to The Naugatuck Chemical Co.) Brit. 363,862, Mar. 18, 1930. Rubber is vulcanized in the presence of a vulcanizing agent, a metallic oxide and a material comprising the group RC(:S)SM, wherein M is a metal, a dinitroaryl or arylmethylene group or the group SC(:S)R or C(:S)R, and R represents an alkylated nitrogenous heterocyclic satd. radical. Prepns. of dipipecolylthiuram disulfide, Zn pipecolyldithiocarbamate, dinitrophenyl ester of pipecolyldithiocarbamic acid, phenylmethylenebispipecolyldithiocarbamic acid and pipecolinium pipecolyldithiocarbamate are described.

# CHEMICAL ABSTRACTS

Vol. 27 APRIL 20, 1933 No. 8

## 1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

**A stirrer drive for laboratory use.** MAX H. HUBACHER. *Ind. Eng. Chem., Anal. Ed.* **5**, 149(1933).—Constructional details are given. B. A. SOULE

**A laboratory cooling unit.** D. H. COOK. *Ind. Eng. Chem., Anal. Ed.* **5**, 147–8 (1933).—A model S Frigidaire unit has been modified to furnish cold water for labs. in tropical climates. B. A. SOULE

**An inexpensive Muencke blower.** RICHARD F. ROBEY. *Ind. Eng. Chem., Anal. Ed.* **5**, 143(1933).—A metal can *I* is fitted with a water exhaust pipe *EGH*, an aspirator *D*, the diam. of which is $< {}^1/_2$ that of *EGH*, and an outlet *B* for the compressed air. B. A. SOULE

**Surface-tension balance.** RICHARD J. DEGRAY. *Ind. Eng. Chem., Anal. Ed.* **5**, 70–3(1933).—Details and manipulation of a balance giving surface-tension readings correct to 0.5 percent are given, together with a discussion of the errors involved and a bibliography. ANN NICHOLSON HIRD

**Automatic microcompensation calorimeter.** L. ALGERA. *Proc. Acad. Sci. Amsterdam* **34**, 906–17(1931).—A calorimeter for botanical use is described and the accuracy of measurement discussed. B. C. A.

**Micro melting-point determinations with the Thiele tube.** EUGENE W. BLANK. *Ind. Eng. Chem., Anal. Ed.* **5**, 74–5(1933).—Two glass rods are fused to the outer side wall of the tube contg. the sample and thermometer and support it when in the Thiele tube. The sample is placed between two small squares, cut from cover glass; this gives a sharper m. p. and is superior for rapid work. ANN NICHOLSON HIRD

**Titration apparatus.** A. P. SCHULZ. *Z. Spiritusind.* **55**, 128(1932).—The buret can be filled repeatedly through a connecting side tube from a cylindrical reservoir by merely tilting the app. B. C. A.

**Automatic titrating devices.** K. C. D. HICKMAN AND C. R. SANFORD. *Ind. Eng. Chem., Anal. Ed.* **5**, 65–8(1933).—A description is given with photographs and drawings of a recording titrator which by optical means controls and records the titration. An indirect visual titrator is described which depends on the gradual mixing of two soln. streams to produce a color change at some point on the scale. A. N. H.

**Portable titration apparatus.** KÁROLY VAS. *Kisérletügyi Közlemények* **35**, 156–60 (1932).—The container for the titrating soln. is connected to the buret; the buret can be filled by tipping the app. The air is filtered through drying tubes. The case of the app. may even be used as a titrating table in the field. Structural details are given. S. S. DE FINÁLY

**An automatic apparatus for the determination of small quantities of sulfur dioxide in air.** P. C. CAPRON. *Bull. soc. chim. Belg.* **41**, 588–96(1932).—A modification of Thomas and Cross' app.; a soln. of $HIO_3$ is used as absorbent for $SO_2$; correct results are obtained from 65 to 0.5 p. p. m. ALBERT L. HENNE

**A modified electro ultrafilter.** D. V. KLOBUSITZKY. *J. Phys. Chem.* **36**, 3189–90 (1932).—Details are given for rigging up a substitute for the Bechhold-König app., from parts commonly found in the lab. JEROME ALEXANDER

**Extractor for large quantities of organic material.** J. J. T. GRAHAM. *J. Assoc. Official Agr. Chem.* **16**, 148–9(1933).—The body of the extractor is an inverted bell jar closed with a desiccator top. The charge is supported by porcelain plate on which rests a layer of absorbent cotton; a vent tube is essential to obtain intermittent siphoning, otherwise the solvent will drop continuously. A. PAPINEAU-COUTURE

**Combustion train for the determination of total carbon in soils.** T. H. HOPPER. *Ind. Eng. Chem., Anal. Ed.* **5**, 142–3(1933).—A modification of the Fleming train used in the steel industry. The absorption tube is made from a test tube. B. A. SOULE

**A differential thermogalvanometer.** JUAN MÁ. TORROJA. *Anales soc. espaň. fís. quím.* **31**, 144–8(1933).—A differential thermogalvanometer is necessary to measure weak currents of high frequency when they are superimposed on a strong d. c. This

is accomplished by an ordinary thermogalvanometer having 2 heating resistances instead of the usual single resistance. The moving coil is *in vacuo*. E. M. SYMMES

**An automatic pressure-regulating unit for vacuum distillation.** E. H. HUNTRESS AND E. B. HERSHBERG. *Ind. Eng. Chem., Anal. Ed.* 5, 144–6(1933).—Constructional details are given for a regulator capable of maintaining within ± 0.15 mm. any pressure in the range 2–30 mm. A bibliography of 40 references is included. B. A. S.

**Scrubbing towers for recovery of volatile liquids.** C. H. BUTCHER. *Ind. Chemist* 8, 131–3(1932).—A tower packing, preferably of simple design, should have a rough surface to reduce the rate of flow of the absorbent. Raschig or Lessing rings or other specially designed packings are much more efficient in practice than coke filling. The choice of absorbent is dependent on the process. Cresol is suitable for vapors of liquids which are miscible with $H_2O$, or tetralin for hydrocarbons nonmiscible with $H_2O$; both serve indefinitely and are not corrosive. Coal-tar oils are less stable and may contain S impurities. $H_2SO_4$ and solns. of bisulfites have been discarded as absorbents on account of inconvenience and inefficiency. B. C. A.

**The interfacial tensions of mineral oil against various aqueous solutions at 40°.** W. G. EVERSOLE AND DALLAS S. DEDRICK. *Proc. Iowa Acad. Sci.* 38, 163(1931).—Abstract. A new and highly improved app. for the direct measurement of interfacial tensions by the drop-wt. method has been devised. By means of an automatic recording device, measurements may be conveniently made on larger vols. and at slower dropping speeds than were heretofore possible. This is particularly valuable in measuring interfacial tensions between liquids contg. surface-active solutes. Preliminary measurements with purified paraffin oil and aq. solns. of H.COONa, Na acetate and Na propionate give very promising results from the standpoint of accuracy and reproducibility The lowering of interfacial tension increases with the length of the C chain. In Na acetate and Na propionate, the interfacial tension decreases hyperbolically up to satn., but with H.COONa the interfacial tension passes through a min. at about 2.5 molal concn. W. G. GAESSLER

**Glass autoclave for the observation of the progress of a reaction under heat and pressure.** O. GERNGROSS, K. M. HOFFMANN AND G. KLEIN. *Chem. Fabrik* 1933, 93.—A description with 2 cuts. J. H. MOORE

**A muffle kiln of high efficiency.** F. H. NORTON AND J. V. DUPLIN, JR. *J. Am. Ceram. Soc.* 16, 152–3(1933).—A gas-fired lab. kiln. C. H. KERR

**An apparatus for automatic registration of dehydration with increasing temperature.** S. ŠKRAMOVSKÝ. *Collection Czechoslov. Chem. Communications* 5, 6–9(1933).—See *C. A.* 27, 452. G. G.

**A thermostat of great precision.** I. D. MENDELEEV. *Trav. inst. métrol. standardisation* (U. S. S. R.) No. 2, 20–32(in French 32–5)(1932).—See *C. A.* 25, 2. G. G.

**A cooling device for operating a water thermostat a few degrees below room temperature.** ALFRED B. GARRETT. *Ind. Eng. Chem.* 25, 355(1933).—A 4-in. fan shunted across the thermostat heater terminals of the relay gives sufficient cooling to keep the bath as much as 10° below room temp. H. E. MESSMORE

**Battery of thermostats for rising temperatures below room temperature** [5–20°]. C. J. DIPPEL. *Chem. Weekblad* 30, 193–6(1933).—A system of 9 thermostats for temps. from 5° to 20° is described. Cooling is effected by cold water flowing through Cu tubes, the length of which has been detd. according to the cooling required. E. S

**Filter for air.** JOHN A. GORDON. U. S. 1,892,210, Dec. 27. Structural features.

**Apparatus for filtering air and other gases.** HENRI LALLEMANT AND AUGUSTE J. M. DE VILLERS. Fr. 739,212, June 28, 1932.

**Tubular suction and pressure filter.** SOC. ANON. DES FILTRES PHILIPPE AND EDOUARD HEIBIG. Ger. 568,237, Oct. 13, 1928.

**Continuous drum or disk type filters suitable for separating liquids from solids.** GERALD O. HILLIER (to Oliver United Filters Inc.). U. S. 1,892,306, Dec. 27. Structural details.

**Filter press.** PAUL W. PRUTZMAN. U. S. 1,891,396, Dec. 20. Structural and mech. details.

**Filter press.** LOUIS A. J. REVEL. Ger. 568,121, June 14, 1928.

**Apparatus for separating oil and water, etc.** CARL BILLAND. Ger. 568,001, Nov. 21, 1928.

PAUL E. KLOPSTEG (to Central Scientific Co.). U. S. 1,891,049, Dec. 13. Details of construction and scale [illegible] are described.

**Temperature indicator of the distance type [suitable for use on airplanes to indicate ice formation].** MOTOMETER GAUGE & EQUIPMENT CORP. Brit. 352,437, Jan. 3, 1929. Structural and mech. features.

**Temperature indicator suitable for use with cooling systems of internal-combustion engines.** H. SCHLAICH. Brit. 350,975, Dec. 20, 1928. Structural details.

**Compensating hydrometer float.** HOWARD E. CHRISTIE and KIBBEY W. COUSE. U. S. 1,890,901, Dec. 13. Structural features.

**Bolometer for use as a radiation pyrometer.** M. BUCHHOLZ. Brit. 355,196, Feb. 13, 1929. A plurality of metal ribbons are positioned so as to present a large surface to the radiation.

**Evaporator of the fin and tube type.** FREDERICK W. HICKS (to McCord Radiator & Mfg. Co.). U. S. 1,891,538, Dec. 20.

**Multistage apparatus for evaporating solutions.** ALFRED HERRLICH. Ger 568,236, July 29, 1931. Addn. to 545,262 (*C. A.* **26**, 2899).

**Apparatus for evaporating liquids or crystallizing salts.** E. M. S. INDUSTRIAL PROCESSES, LTD. Fr. 738,577, June 13, 1932.

**Drying shaft.** ERNST ZANDER. Ger. 568,294, Sept. 2, 1930.

**Surface condensers.** ALBERT DE SMAELE. Brit. 366,659, Dec. 17, 1930.

**Surface condenser.** SIEMENS-SCHUCKERTWERKE A.-G. (Gustav Köhler, inventor). Ger. 568,435, Mar. 20, 1930.

**Condenser suitable for steam or power plants.** CLEMENT A. RAINEY. U. S. 1,891,607, Dec. 20.

**Microscope condensers.** FIRM OF E. LEITZ. Brit. 348,202, Jan. 31, 1929. Structural and optical features.

**Catoptric microscope condenser.** A. F. C. POLLARD. Brit. 348,411, May 29, 1930. Structural and optical features.

**Diffusion apparatus for gases.** EGYESÜLT IZZÓLAMPA ÉS VILLAMOSSÁGI R. T. Brit. 367,313, Oct. 22, 1930. Gas mixts. contg. K and Xe are enriched in these constituents by thermal diffusion.

**Apparatus for the adsorption of gases.** METALLGESELLSCHAFT A.-G. and GEORG MÜLLER. Brit. 366,885, Sept. 19, 1931.

**Apparatus for treating gases with liquids.** E. HAVEAUX. Brit. 382,962, Aug. 4, 1931. App. for separating dust from gases by impact on a liquid surface.

**Apparatus for washing gases.** CARRIER ENGINEERING CO. LTD. and KENNETH J. R. ROBERTSON. Brit. 364,239, Nov. 5, 1930.

**Vertical rotary gas washer.** HERMANN WOLFRAM. Ger. 568,165, Jan. 7, 1931.

**Gas scrubbers.** ALBERT F. KUNBERGER (to Humphreys & Glasgow, Ltd.). Brit. 363,683, Sept. 3, 1929. Void.

**Equipment for testing or controlling the calorific value of gases.** C. B. WALKER and H. O. WRAITH. Brit. 383,654, July 9, 1931.

**Expansion-chamber-type gas gun suitable for discharge of irritating gases or smoke, etc.** BYRON C. GOSS. U. S. 1,892,050, Dec. 27. Structural features are described of guns having an elec. system that serves to operate the guns, which may be used in series in banks, etc., for repelling bandits.

**Device for indicating the presence of firedamp in the atmosphere.** HENRY DE B. KNIGHT (to The British Thomson-Houston Co. Ltd.). Brit. 366,020, Oct. 25, 1930.

**Apparatus for the concentration of liquids in evacuated chambers by sulfuric acid.** PETER SCHLUMBOHM. Brit. 367,341, Oct. 8, 1930.

**Sampling device for liquids.** I. A. GORSHKOV. Russ. 24,990, Nov. 9, 1930.

**Sampling device for liquids.** I. A. GORSHKOV. Russ. 26,834, Oct. 8, 1930.

**Salt-dissolving apparatus suitable for dissolving rock salt in water.** THOMAS F. COURTHOPE and WM. H. MCGUIRE (to Retsof Mining Co.). U. S. 1,892,331, Dec. 27. Structural features.

**Apparatus for directly indicating the specific gravity of solids.** C. MAHIEU (to Soc. anon. des anciens établissements P. Morival). Brit. 354,774, Feb. 14, 1929.

**Supporting centrifugal and like apparatus.** SIEMENS-SCHUCKERTWERKE A.-G. Brit. 364,478, May 3, 1930. Addn. to 342,105.

**Apparatus for electrometric volumetric analysis.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,939, Mar. 31, 1930. Addn. to 309,038 (*C. A.* **24**, 272).

**Catalytic apparatus.** FRITZ DEMMEL (to A. P. P. A. (Accessories pratiques pour automobiles)). Brit. 364,342, Jan. 9, 1930. A catalytic burner comprises an upper layer of platinized asbestos fabric or millboard and a pad of asbestos fiber, glass wool or other fibrous incombustible material supported by a perforated disk in a casing adapted to be screwed on a container provided with a wick for supplying benzine or other vapor.

**Apparatus for testing the hardness of materials.** CHARLES H. WILSON (to Wilson Mechanical Instrument Co.). U. S. 1,890,923, Dec. 13. Mech. features.

**Endless-chain molding machines.** Établissements Julien Damoy. Brit. 365,382, Mar. 5, 1930.

**Dry kiln suitable for drying lumber, etc.** James F. Cobb. U. S. 1,891,060, Dec. 13.

**Smoke-detector apparatus.** J. Lyons and Co. Ltd., Charles R. Passmore and Thomas W. Chiplin. Brit. 364,661, Oct. 1, 1930.

**Spraying nozzle associated with a mixing or reaction vessel.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler (Karl Werner, inventor). Ger. 568,122, Dec. 12, 1930.

**X-ray apparatus.** C. H. F. Müller A.-G. Brit. 353,353, Nov. 19, 1929. Structural and elec. features.

**Portable x-ray apparatus.** N. V. Philips' Gloeilampenfabrieken. Brit. 351,534, April 5, 1929. Structural and mech. features.

**X-ray tube and associated electrical apparatus.** W. E. Schall and Schall & Son, Ltd. Brit. 351,710, May 31, 1930. Various details are described of an elec. system for supplying unidirectional high-tension current from a source of 3-phase a. c.

**Apparatus for x-ray examination of crystalline bodies such as pearls.** N.-V. Gloeilampenfabrieken. Brit. 351,744, July 15, 1929. Structural and optical features.

**Apparatus for observing x-ray projections in different planes simultaneously with the surface of an object.** J. M. Hernandez. Brit. 350,911, March 16, 1929.

**Röntgen-ray apparatus.** Julius B. Wantz (to The British Thomson-Houston Co. Ltd.). Brit. 362,882, June 6, 1929. Void.

**Röntgen-ray apparatus.** C. H. F. Müller A.-G. Brit. 363,194, Apr. 24, 1930 Addn. to 339,215 (*C. A.* **25**, 2336).

**Monochromators and spectroscopic apparatus.** Carl Müller. Brit. 363,264, Apr. 15, 1930. Addn. to 344,722.

**Electron-discharge device.** Telefunken Gesellschaft für drahtlose Telegraphie m. b. H. Brit. 363,755, Nov. 13, 1929.

**Electric discharge tubes for the emission of rays.** N. V. Philips' Gloeilampenfabrieken. Brit. 363,914, Apr. 4, 1930.

**Luminous electric discharge tube.** Patent-Treuhand-Gesellschaft für elektrische Glühlampen m. b. H. (to The General Electric Co. Ltd.). Brit. 363,092, Jan. 11, 1930.

**Cathode for electric discharge devices.** Wm. F. Winter, Jr. (to General Elec. Co.). U. S. 1,891,074, Dec. 13. A cathode is formed of a plurality of superposed disks of metal such as Ni coated on both sides with electron-emitting material such as $BaCO_3$, with the coatings in contact with each other. Cf. *C. A.* **27**, 872.

**Photoelectric cells.** The General Electric Co., Ltd. and Norman R. Campbell. Brit. 363,877, Feb. 4, 1931. Deteriorated cells, *e. g.*, those in which the cathode has been produced by heating oxidized Ag in the presence of Cs vapor to about 200°, are restored wholly or in part to their original condition by heating to a temp. near that used in their manuf. Thus for the above example the cell is heated to 180° for 15 min.

**Photoelectric tubes.** Kenneth T. Bainbridge (to The British Thomson-Houston Co., Ltd.). Brit. 364,006, Aug. 28, 1929.

**Comparison photometer with a light-sensitive cell.** F. C. Whalen and Radiovisor Parent, Ltd. Brit. 350,703, May 24, 1930. Optical, elec. and mech. features.

**Color-analyzing apparatus with a photoelectric cell.** J. Razek and P. J. Mulder Brit. 349,565, Dec. 28, 1929. Structural, optical and electrical details.

**Cathodes for thermionic discharge vessels.** Paul Schwarzkopf and Deutsche Glühfadenfabrik Rich. Kurtz und Paul Schwarzkopf G. m. b. H. Ger. 568,033, Mar. 14, 1925. The cathodes are made from a solid soln. in Mo of 2.5–4% of an alk earth metal or Mg or a mixt. of any of these.

**Regenerative furnaces.** Compagnie générale de constructions de fours. Fr. 738,535, June 11, 1932.

**Regenerative furnaces.** Wm. B. Mitchell. Fr. 738,783, June 17, 1932. Construction and piling of the bricks is described.

**Means for heating evaporators, autoclaves, etc., with circulated superheated steam.** Eugen Hadamovsky. Ger. 568,004, June 8, 1930, and 568,234, Feb. 5, 1931.

**Furnace, especially for coal distillation at 400–600°.** Jenö Schlattner. Hung. 104,659, July 16, 1928. Mech. details.

**Furnace linings.** Plibrico Jointless Firebrick Co. Brit. 382,270, Aug. 14, 1930. Device for anchoring furnace linings to a wall, and allowing for expansion and contraction.

**Cooling tuyères for underfeed stokers.** American Engineering Co. Brit. 363,725, June 7, 1930.

**Arched furnace roofs.** The Gas Light & Coke Co., Wm. G. Adam and Percy Gray. Brit. 364,123, Oct. 1, 1930. Means are provided for forming longitudinal passages for the admission of air to the space below the roof.

**Regulating valves for liquid-fuel-burning plant.** John G. McKean. Brit. 363,796, Nov. 28, 1930.

**Heat-exchange apparatus suitable for use as a surface evaporator.** François X. J. A. Delas. U. S. 1,891,705, Dec. 20. Structural features.

**Heat-exchange apparatus suitable for pasteurizing or cooling liquids.** Kirk K. Wright (to R. G. Wright & Co.). U. S. 1,891,518, Dec. 20. Structural features.

**Means for heating, cooling and ventilating enclosures.** Carrier Engineering Co., Ltd. and Stanley L. Groom. Brit. 363,370, Sept. 10, 1930. Divided out of 351,025.

**Oven suitable for heat-treating cold-molded products.** Clarence A. Herbst (to Economy Fuse and Mfg. Co.). U. S. 1,891,981, Dec. 27. Structural and mech. features of an air-circulating system, etc.

**Apparatus for sintering materials.** Herbert Wittenberg (to American Lurgi Corp.). U. S. 1,891,298, Dec. 20. Mech. and structural features.

**Acetylene generator [water to carbide type].** Josef Marik. Ger. 568,317, May 10, 1931.

## 2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

**Life and work of L. L. Grimbert, 1860–1931.** H. Hérissey and P. Fleury. *J. pharm. chim.* **16**, 275–320(1932).—Biography, with portrait and review of the scientific work of G. S. Waldbott

**Marko T. Leko [Lecco].** S. Mikholić. *Bull. soc. chim. roy. Yougoslav.* **3**, 127–40 (1932).—Obituary with résumé of Leko's work, accompanied by a portrait. E. J. C.

**Inventor of methods. Friedrich Wilhelm Ostwald, a chemist whose chief interest was scientific method.** A. P. Sachs. *Chemist* **10**, 11–21(1933). E. H.

**Chemistry at Vassar.** Mary Landon Sague. *Chemist* **9**, 818–24(1932). E. H.

**Reference tables for platinum to platinum-rhodium thermocouples.** Wm. F. Roeser and H. T. Wensel. *Bur. Standards J. Research* **10**, 275–87(1933). E. H.

**Interferometric measurement of atomic distances in molecules.** P. Debye. *Chemistry at the Centenary (1931) Meeting of the British Association for the Advancement of Science*, **1932**, 204–9. **Evidence from molecular spectra.** J. E. Lennard-Jones. *Ibid* 210–25. **A report on homeopolar valency and its quantum-mechanical interpretation.** R. H. Fowler. *Ibid* 226–46. **Discussion on the structure of simple molecules.** W. Heisenberg. *Ibid* 247–8.—Crit. In cases where the valence scheme of Hund and Lennard-Jones disagrees with that of London and Heitler, the quantum theory does not as yet allow a conclusive explanation of the exptl. facts. **The application of the theory of homeopolar valency to polyatomic molecules.** M. Born. *Ibid* 249–54.—See *C. A.* **26**, 3152. **The structure of molecules. The solid state.** W. L. Bragg. *Ibid* 255–6. **Anomalous dispersion in solids.** P. Debye. *Ibid* 257. L. Onsager

**Geographic and oceanographic research in Indian waters. VI. Temperature and salinity of the deeper waters of the Bay of Bengal and Andaman Sea.** R. B. Seymour Sewell. *Mem. Asiatic Soc. Bengal* **9**, 357–423(1932). E. H.

**$p_H$ and the rhythm of the tides.** Alphonse Labbé. *Compt. rend.* **195**, 1297–9 (1932).—With ebbing tide the $p_H$ follows a descending curve and returns with a rising tide. Diurnal variations are greater than nocturnal. The effects caused by photosynthesis and marine animal life are considered factors. R. P. Walton

**Quantitative analysis of elements in a demonstration experiment.** W. Florke and W. Vogt. *Z. physik. chem. Unterricht* **45**, 266–7(1932).—A simplified combustion tube and absorption train gave satisfactory results on EtOH in a demonstration expt. A. Lloyd Taylor

**The thermoelectric production of phosphorus in lecture demonstration.** Heinrich Rheinbolt. *Z. physik. chem. Unterricht* **45**, 257–61(1932).—P in small amts. can be prepd. on the lecture table in a 2-l. hard-glass bulb. In the center of the bulb a graphite crucible is supported on one electrode, which enters the bulb through a tubulature in

the bottom. The second electrode enters through an opposite tubulature and extends into the $Ca_3(PO_4)$ and $SiO_2$ contained in the crucible. An inert atm. is necessary.
A. LLOYD TAYLOR

**The measurement of high temperature.** T. MORI. *J. Fuel Soc. Japan* **11**, 1748–61(in English 130)(1932).—Methods and app. for high-temp. measurement are described. F. I. NAKAMURA

**Chemical control of relative humidity in closed spaces.** HARVEY L. SWEETMAN. *Ecology* **14**, 40–5(1933).—In an investigation of the use of supersatd. chem. solns. for the control of relative humidity in small closed containers, humidities obtained with chem. compds. did not change during a period of 6 mos. The dewpoint method was better than the cog psychrometer for these measurements. ALLEN S. SMITH

**Types of chemical reactions.** WM. A. NOYES. *J. Am. Chem. Soc.* **55**, 656–61 (1933).—Reactions are classified as: (*1*) formation of ions, (*2*) ionic reactions and (*3*) dissocn. and reaction of electrically neutral atoms and mols. Six electron ions are discussed and the principles governing the formation of inorg. complexes are mentioned.
E. J. ROSENBAUM

**Third report of the committee on atomic weights of the International Union of Chemistry.** G. P. BAXTER, MME. M. CURIE, O. HÖNIGSCHMID, P. LE BEAU AND R. J. MEYER. *J. Am. Chem. Soc.* **55**, 441–52; *Ber.* **A66**, 21–30(1933). —The at. wt. of I is changed from 126.932 to 126.92 and that of La from 138.90 to 138.92. Résumés are given of recent work on C, N, F, K, Se, I, Te, Kr, Xe, La, Th, H, B, Li, Na, K, Cs and Zn. Cf. *C. A.* **26**, 2901. L. P. HALL

**The neutron and neuton, the new element of atomic number zero.** WM. D. HARKINS. *Nature* **131**, 23(1933).—The aggregate of neutrons of unit mass and neutrons of mass 2, if they exist, may be considered collectively as an element. It is suggested that the name neuton be applied to this element in conformity with the final ending of chemically indifferent elements. Neuton is classified according to the nuclear formula $(p_2e)$, $(pe)_4$ proposed by H. in 1921. WILLIAM J. KROEGER

**Formation of a molecule from atoms in one elementary act.** B. KONDRAT'EV *J. Phys. Chem.* (U. S. S R.) **3**, 383–89(1932).—Above 1500 A. U. and at 0.7 mm. Hg, the process $Br + Br^- \longrightarrow Br_2 + h\nu$ competes with the process $Br + Br + Br_2 \longrightarrow Br_2 + Br_2$. F. H. RATHMANN

**Symmetry of the benzene molecule.** V. R. DEITZ AND D. H. ANDREWS. *J. Chem. Physics* **1**, 62–7(1933).—The symmetry no. as calcd. from an equation involving the vapor pressure, the heat capacity of the crystal, the heat capacity of the vapor as calcd. from Raman spectra, the heat of sublimation and the moments of inertia, is $6 \pm 0.5$ for $C_6H_6$ and $2 \pm 0.2$ for $C_6H_{10}$ indicating that the mol. is not plane. The abs. vapor pressure can be calcd. from the thermal and statistical properties of the mol. by this method. JANET E. AUSTIN

**Graphic study of the relation of organic compounds to the percentages of elements. III.** TSUNETO HIGASHI. *Bull. Inst. Phys.-Chem. Research* (Tokyo) **11**, 1062–71 1932); (*Abstracts* (in English) published with *Sci. Papers Inst. Phys.-Chem. Research* Tokyo) **19**, Nos 380–2, 111–15).—For a chem. reaction such as $A + B = (AB)$, $A + nB = AB_n$), $A + (B + D) = K$, $A + (mB + m'D) = K_1$, the position on a triangular diagram previously described), of the point for the original substance $A$, relative to that for the reaction product $(AB)$ or $K$ was studied. When this graphical method was applied to *coal* (the analytical data used for the percentages of C, H and O were those reported by Ralston (*C. A.* **10**, 1421), to work out the chem. changes accompanying the conversion of lignite to anthracite, the results agreed well with the exptl. facts. **IV.** *Ibid* 1254–65 (*Abstracts*)(in English) published with *Sci. Papers Inst. Phys.-Chem. Research* (Tokyo) **19**, Nos. 394–7(1932)).—In a triangular diagram, indicating the compn. of org. compds., the formation point for $(C_nH_mO_k)$ coincides with that of $(C_nH_mO_k)$ $l/k$ or $(C_{n/k}H_{m/k}O)$, because they have the same at. ratio. When the compds. have the same no. of O atoms, their formation points lie on a line horizontal to the base CH line; if the no. of O atoms is different, the heights of these points from the base line are proportional to the no. of O atoms. Conversely, the compd. represented by the points found at the same height from the base line have the same normal mol. wt., and consequently their true mol. wts. are either the same or in a simple integral ratio. The point for an addn. compd. $AB$ can be detd. by intercepting the horizontal line corresponding to the normal mol. wt. of the addn. compd. and the line connecting the points $A$ and $B$. Based on these facts, the method for detg. the point representing the compn., percentages of elements, and mol. formula of a certain compd. from its mol. wt. and the kind of homolog, and that for detg. the combining ratio of 2 substances by analytical data are demonstrated. K. KONDA

**Dependence of dielectric constants of gases on temperature and density.** H. H. UHLIG, J. G. KIRKWOOD AND F. G. KEYES. *J. Chem. Physics* **1**, 155–9(1933).—The

dielec. consts. of $CO_2$, $NH_3$, $CH_4$, N and H were measured at high pressures (20–250 atm.) and various temps. by the heterodyne beat method. The molar polarization increases slowly with d. for $NH_3$ and $CO_2$ and is entirely independent of d. for $CH_4$, N and H. It is independent of temp. for $CO_2$, $CH_4$, N and H but varies greatly with temp. for $NH_3$. From this variation the dipole moment of $NH_3$ is calcd. to be $1.48 \times 10^{-18}$ e. s. u. The part of the polarization due to optical and non-rotational terms is 6.2 cc. per mol. E. J. ROSENBAUM

**The applicability of the resonance method for measuring dielectric constants of aqueous electrolytic solutions.** M. JEZEWSKI. *Physik. Z.* **34**, 88–94(1933); cf. *C. A.* **26**, 3415.—The sources of error that enter into measurements of dielec. consts. of conducting liquids by the resonance method are discussed. Expts. prove that satisfactory results are obtained with this method if the following conditions are fulfilled: the effect of the exciting circuit on the detector circuit and the linear change of the emitted wave in consequence of the reaction of the resonance circuit must be removed; the capacity of the resonance circuit must be standardized against the capacity on both sides of the resonance point; the measuring condenser must be electrostatically protected; the displacements of the inserted wire must be exactly the same during the measurements. ALLEN S. SMITH

**The dipole moment of nitric oxide.** C. P. SMYTH AND K. B. MCALPINE. *J. Chem. Physics* **1**, 60–1(1933).—The dielec. const. of NO was measured from 235° to 477°K. at detd. pressures. The polarization calcd. from these data varied from 4.81 to 4.90, a max. at 335°. The dipole moment of NO was almost zero, $0.1 \times 10^{-18}$. L. P. HALL

**Electric moments of hydrazine and its derivatives.** L. F. AUDRIETH, W. NESPITAL AND H. ULICH. *J. Am. Chem. Soc.* **55**, 673–8(1933).—The dielec. consts. of dil. $C_6H_6$ solns. of $N_2H_4$ and several of its derivs. were measured and these data used in calcg. their dipole moments (given in Debye units = $\mu = 10^{-18}$ e. s. u.): $N_2H_4$, 1.83–1.85; phenylhydrazine, 1.65–1.79; $\alpha,\alpha$-phenylmethylhydrazine, 1.79; $\alpha,\alpha$-diphenylhydrazine, 1.87; hydrazobenzene, 1.53; benzaldehyde phenylhydrazone, 1.97; benzalazine, 1.00. L. F. AUDRIETH

**Criticism of the electrical differential method for measuring the $C_v$ of gases. V. New measurements; $C_v$ of carbon dioxide.** MAX TRAUTZ AND HERBERT BLUM. *Ann. Physik* **16**, 362–76(1933); cf. *C. A.* **25**, 10.—For $CO_2$ at 1 atm. the following data for $C_v$, in cal. $mol^{-1}$ $deg.^{-1}$ were obtained: 15.3°, 6.77 ± 0.02; 18.0°, 6.79 ± 0.02; 19.0°, 6.80 ± 0.02. F. D. ROSSINI

**Determination and calculation of viscosity of gas mixtures.** L. ZIPPERER AND G. MÜLLER. *Gas u. Wasserfach* **75**, 623–7, 641–4, 660–4(1932).—The viscosities of individual gases and formulas for calcg. the viscosity of com. fuel gases are discussed. Viscosities of individual gases and mixed gases were detd. with an app. using a V2A steel capillary tube. The best agreement between exptl. and calcd. values was found by using Mann's and Zipperer's formulas, the latter formula being the simplest: kinematic viscosity at 20° (sq. cm. $sec^{-1}$) = $1540/[(O_2 + CO + CH_4 + N_2) + 2(CO_2 + C_mH_n) + (H_2/7)]$, in which $O_2$, etc., represents the percentage of the given gas constituent. Bibliography of 56 references appended. **Viscosity of mixed gases.** H. RICHTER. *Ibid* 989(1932).—Polemical with Zipperer and Müller (preceding abstr.) The Biel formula for calcg. viscosity from sp. gr. is simpler than the Mann or Zipperer-Müller formulas and gives satisfactory results. **Reply.** L. ZIPPERER AND G. MÜLLER. *Ibid* 989–90.—The formula suggested by Richter does not give good results with gases high in percentages of methane or higher hydrocarbons. R. W. RYAN

**Vapor viscosities and the Sutherland equation.** J. HOWARD ARNOLD. *J. Chem. Physics* **1**, 170–6(1933).—Sutherland consts. can be found by using mol. diams. calcd. from b.-p. vols. They can serve as criteria of the accuracy of exptl. data on vapor viscosities. By use of this method, recent data are critically reviewed. Deviations from the Sutherland equation are discussed. E. J. ROSENBAUM

**Experimental determination of the flame temperatures of complex mixtures of combustible gases and a method for calculating them.** BERNARD LEWIS, HENRY SEAMAN AND G. W. JONES. *J. Franklin Inst.* **215**, 149–67(1933); cf. *C. A.* **26**, 3970.—The flame temp. of H, $CH_4$ and CO contg. various amts. of N and $CO_2$ and burned in air were detd. From these data and the mixt. law, the flame temp. of complete mixts. and industrial gases were calcd. Calcd. values agreed well with detd. values. C. L. WILSON

**Dispersion of sound in nitrogen tetroxide and its interpretation in terms of dissociation rate.** WM. T. RICHARDS AND JAMES A. REID. *J. Chem. Physics* **1**, 114–28 (1933); cf. *C. A.* **26**, 4231.—Several types of dispersion of sound that may be observed in a dissocg. gas are discussed and of these only heat-capacity dispersion and dissocn. dispersion need be considered under exptl. conditions. A modification of Einstein's

equation for the velocity of sound in a dissocg. gas was derived to include heat-capacity dispersion. Measurements of the velocity of sound in $N_2O_4$ in a special app. (described in detail) are reported; the temp. range is 0° to 30°, the pressure range 132 to 670 mm., and the frequency variation from 9 to 451 kc. The estd. precision is ±0.1 m./sec. The max. dispersion is approx. 5 m./sec. The rate const. for the dissocn. reaction is $4.8 \times 10^4 \pm 0.5 \times 10^4$ at 25° and 260 mm. and the activation energy is 13.9 ± 0.9 Cals. The rate const. seems to diminish as the pressure is reduced. The effective mol. diams. for the activational process are at least 3 times those for ordinary kinetic collisions. WILLIAM E. VAUGHAN

**The process of vapor evolution.** K. SCHREBER. *Z. tech. Physik* **14**, 81–5(1933).—In the process of vaporization there is always a finite temp. difference between the liquid and the vapor at the surface. This difference depends on the vaporization velocity for pure liquids, and on the osmotic pressure and surface curvature for solns. A. F.

**Relationship between boiling point and chemical constitution.** K. BILLIG. *Svensk Kem. Tids.* **44**, 169–72(1932)(in German).—A continuation of assocn. studies (*C. A.* **26**, 3158); the paraffin series, $CH_4$-$C_8H_{18}$, is used. A. R. ROSE

**The pressure of saturated water vapor in the range 100° to 374°.** N. S. OSBORNE, H. F. STIMSON, E. F. FIOCK AND D. C. GINNINGS. *Bur. Standards J. Research* **10**, 155–88(1933). E. H.

**Vapor-pressure measurements on isobutane.** WALTER HÜCKEL AND WALTER RASSMANN. *J. prakt. Chem.* **136**, 30–40(1933).—The vapor pressures of different samples of isobutane were detd. from —10° to —60°. The variations in the results of different investigators are discussed in relation to the purity of the isobutane used. P. T. NEWSOME

**Surface tension and its measurement.** ALLAN FERGUSON. *J. Sci. Instruments* **10**, 34–7(1933); cf. *C. A.* **26**, 4988. E. H.

**The surface tension of liquids.** MARCELLO SETA. *Industria chimica* **7**, 1488–96 (1932).—A review. A. W. CONTIERI

**The surface tension of mercury in a silica apparatus.** R. S. BURDON. *Trans Faraday Soc.* **28**, 866–76(1932).—The surface tension of Hg in a vacuum is 488 dynes/cm and is the same for a drop freshly formed in air. The temp. coeff. is —0.23 dyne per cm. per degree (up to 230°). Work up to the present does not admit of a pos. conclusion as to the action of gases on a Hg surface. WILLIAM J. KROEGER

**The surface tension of binary mixtures. II.** YONEZO MORINO. *Bull. Inst. Phys.-Chem. Research* (Tokyo) **11**, 1296–322(*Abstracts*(in English) published with *Sci. Papers Inst. Phys.-Chem. Research* (Tokyo) **20**, Nos. 398–401(1932)); cf. *C. A.* **27**, 6. A new formula for the relation between crit. temp. and compn. previously used without explanation is derived from the assumptions that the van der Waals equation of state can be extended to the region of binary mixts., and consts. $a$ and $b$ can be expressed as follows: $\sqrt{a} = x\sqrt{a_A} + (1-x)\sqrt{a_B}$, $b = xb_A + (1-x)b_B$. The resulting formula, $T_k = xT_{kA} + (1-x)T_{kB} - (x(1-x)(\sqrt{nT_{kA}} - \sqrt{T_{kB}})^2)/(n-(n-1)x)$ ($T_k$, $T_{kA}$ and $T_{kB}$ denote the crit. temp. of the quasi-pure mixt. of the components $A$ and $B$, and $n = b_B/b_A$) is found to express with fair accuracy the crit. temp. of the mixt of org. liquids observed by other authors. The relation between mol. surface energy and compn. at a given temp. is derived from the relation given above, and is found to agree well with numerous expts. of other authors. K. KONDA

**The flow of mercury through contracted capillaries.** H. EBERT AND W. ENDE. *Z. tech. Physik* **14**, 64–6(1933).—Moving pictures at the rate of 500 pictures per second of the flow of Hg through the constricted portion of max. thermometers revealed a stepwise flow, which causes the jump and error of these thermometers. The phenomenon is related to the cleanliness of the Hg. ARTHUR FLEISCHER

**The vapor pressure of crystalline benzene and cyclohexene.** V. R. DEITZ. *J. Am. Chem. Soc.* **55**, 472–5(1933).—The vapor pressures of cryst. $C_6H_6$ and cyclohexene were detd. over the temp. range 165° to 200°K. by the Knudsen method. When log $P$ is plotted against $1/T$ the data for $C_6H_6$ fall on a straight line with those of previous investigators at higher temps. P. T. NEWSOME

**Permeability of quartz and Pyrex and other glass to helium.** J. C. MCLENNAN AND J. O. WILHELM. *Trans. Roy. Soc. Can.* III, **26**, 119–22(1932); cf. *C. A.* **25**, 4158.—Expts. showed that He penetrates quartz and Pyrex glass, the rate of penetration increasing with the temp. Evacuated, outgassed and sealed quartz tubes were placed in an atm. of He until the desired pressure of He inside the tubes was reached when they were removed from the He bath and used as He discharge tubes. J. W. S.

**Binding energies in the growth of crystal nuclei from metallic atoms.** HUGH S. TAYLOR, HENRY EYRING AND ALBERT SHERMAN. *J. Chem. Physics* **1**, 68–76(1933).—On the assumption that the binding in the metal lattice is essentially homeopolar the bind-

ing energies of various geometrical configurations of 3–8 atoms of Na are computed by the use of first-order perturbation theory. The growth of a unit cell probably proceeds from the diatomic mol. to a square, then the fifth atom adds along a cube edge, the sixth at the body center, and the configuration is completed by atoms at the remaining corners of the cube. This leads to a highly unstable configuration, which is in keeping with characteristics of finely divided particles. The treatment is extended to Cu, giving higher energies of activation for nuclei formation. The percentage of the total energy assigned to interchange is an important factor. When applied to H (90% interchange energy) a metallic structure is shown to be completely unstable. W. E. V.

**Recrystallization of tin-rich mixed crystals.** A. A. Bochvar and N. E. Merkurvev. *Z. anorg. allgem. Chem.* **210**, 161–2(1933).—In the recrystn. of Sn, the size of the crystals depends upon the purity. The effect of Sb, Pb, Bi, Cu and Al was studied. In general, mixed-crystal-forming metals have about the same effect upon recrystn. as upon hardness or elec. cond. Sb is least sol. but has the greatest effect. H. Stoertz

**Solid solutions by precipitation and isomorphism of complexes of quadrivalent platinum and tellurium. II. The chlorotellurite of cesium and the systems: $Cs_2PtCl_6$–$Cs_2TeCl_6$, $Rb_2PtCl_6$–$Cs_2PtCl_6$.** G. Natta and R. Pirani. *Atti accad. Lincei* **16**, 265–70(1932); cf. *C. A.* **26**, 5239–40.—$Cs_2TeCl_6$ was prepd. by pptn. as with the previous compds. studied, $TeO_2$ and CsCl in concd. HCl soln. being used. The photogram, obtained by the powder method, with an Fe anticathode, shows $Cs_2TeCl_6$ belongs to the cubic system, with $a = 10.45 \pm 0.01$ A. U.; vol. $1141.2 \times 10^{-24}$ cc., d., if 4 mols. are assumed in the unit cell, 3.51. $Cs_2PtCl_6$ and $Cs_2TeCl_6$ have lattices whose sides differ by only 0.30 A. U., so that complete miscibility is expected, and actually obtained. Similarly, the compds., $Rb_2PtCl_6$ and $Cs_2PtCl_6$, having sides within 0.32 A. U., are also completely miscible. A. W. Contieri

**X-ray studies of the diffusion of copper into nickel.** Chujiro Matano. *Mem. Coll. Sci. Kyoto Imp. Univ.*, Ser. A, **15**, 351–3(1932); cf. *C. A.* **26**, 350, 5264.—The coeff. of diffusion of Cu into Ni was detd. from the changes of radii of Debye rings, as $3.5 \times 10^{-7}$ sq. cm./day at 650°, and $1.9 \times 10^{-5}$ sq. cm./day at 890°. The samples were prepd. by electroplating Ni on Cu plates (about 0.5 mm. thick). X-ray photographs were taken with the Cu $K_\alpha$ line ($\lambda = 1537$ x. u.). C. E. P. Jeffreys

**The existence of resistance limits for mixed crystals with irregular atom distribution. II.** U. Dehlinger and R. Glocker. *Ann. Physik* **16**, 100–10(1933); cf. *C. A.* **26**, 4990. –Simple chains of the more reactive atoms in mixed crystals with irregular distribution react at 50 atoms %; double chains at 29 atoms % and triple chains at 21 atoms %. Hence the soly. changes rapidly at these concns. If one assumes a mobility of the nobler atoms remaining after soln. of the more reactive atoms, the former forms an unattackable layer when the concn. of the reactive atoms is not greater than 50, 29, or 21 atoms %, resp. Louis Waldbauer

**Fusion of carbon.** A. Egerton and M. Milford. *Nature* **131**, 169(1933).—Spherules of graphite 0.02 mm. in diam. or smaller, d. 2.25, are formed by a C arc in $H_2$ at 90 atm., dissipating 20 kw. They must be formed by the action of surface tension on molten C. The temp. of the arc was not detd. Janet E. Austin

**The graphitization of diamond.** Béla Lányi and Imre Szarvasy. *Math. naturw. Anz. ungar. Akad. Wiss.* **48**, 137–45(1931).—Graphitization of diamond powder kept at 1600° for 7 hrs. was demonstrated by Röntgen examn. No change was found in powder kept at 1370°. The effect is stronger at 1760°, but unchanged diamond is still present. The relative intensities of the stronger graphite lines are the same as those of natural or artificial Acheson graphite or as those of graphite formed from diamond by graphitization. The presence of amorphous C could not be demonstrated. The size of grains of submicroscopic crystals of graphite formed from diamond at 2000° was about the same as that of silver graphite produced from $CH_4$ at 1200°. S. S. de Finály

**Rotation of molecular groups in crystalline solids.** C. S. Hitchcock and C. P. Smyth. *J. Am. Chem. Soc.* **55**, 1926–7(1933).—In solid $H_2S$ 2 sharp transitions are shown by the dielec. const. at —146.7° and —170°; it shows almost free mol. rotation above the lower transition; below it, there appears to be practically no dipole rotation. The low dielec. const. of solid $NH_3$ and its small decrease with decreasing temp. show that the mol. behaves like large mols. in possessing little or no rotation in the solid. The dielec. const. of solid MeOH near the m. p. is much lower than that of the liquid but high enough to give evidence of some dipole rotation, which decreases sharply at a transition pt. —114°. C. J. West

**The translation of surface changes into the interior of crystals.** D. Balareff and B. Srebrow. *Kolloid-Z.* **61**, 344–6(1932); cf. *C. A.* **24**, 5562.—The Tammann reaction temp. was detd. in the systems of BaO with $MnO_2$, $PbO_2$, $SnO_2$, $CaCO_3$ and Cu, Zn, Mg, Co, Ca and Sr sulfates, and in the system: CaO–$MoO_3$. The results support the previous conclusion. A. Fleischer

**Magnetic properties of thin nickel films.** H. E. MALMSTROM. *Proc. Iowa Acad. Sci.* **38**, 214(1931); cf. *C. A.* **25**, 4452.—An abstract. Ni films deposited from a Ni $NH_4$ sulfate soln. contg. $H_3BO_3$ showed decreasing coercive force with decreasing thickness in the range from 140 to 60 mμ. The films were similar to films deposited from the same soln. but without $H_3BO_3$, but were magnetically harder. Ni films show an aging effect not found in Fe and Co. Heating to 100° accelerates this effect. The effect of tension on the films was studied by measuring at 100°, in which case the differential expansion of the brass base and film supplied the tension. The effect was zero for thickness of about 100 mμ and was opposite in sense for thicker and thinner films. This result cannot be explained in terms of the usual effect of tension on bulk Ni. W. G. G.

**The recovery of electrical resistance and of hardness after cold working of copper, silver and gold, as well as of platinum and palladium.** G. TAMMANN AND K. L. DREYER. *Ann. Physik.* **16**, 111–19(1933).—Cu, Ag and Au, belonging to a natural group in the periodic system, are very similar in their recovery from the affects of cold working. Pt and Pd, belonging to another group, behave differently, although they have the same type of crystal lattice. LOUIS WALDBAUER

**The change of thermal electromotive force on the recovery of metals from cold working.** G. TAMMANN AND G. BANDEL. *Ann. Physik* **16**, 120–8(1933).—Curves and tables are given for the thermal e. m. f. for temps. below the beginning of recovery as well as the temps. of the beginning and of the end of recovery for Ag, Cu, Au, Mg, Fe, Ni, Pt and Pd. Cold working affects Ag more than it does Cu and Au. The recovery interval is smallest for Ag, increasing for Au and Mg, then Cu, and for Fe, Ni, Pd and Pt is about 200° and over. The effect of torsion also was investigated. L. W.

**Change in qualities of nonmetallic substances on cold working.** G. TAMMANN *Naturwissenschaften* **20**, 958–60(1932); cf. *C. A.* **27**, 689.—Changes in properties analogous to those of metals during rolling, annealing, etc., can be found for some nonmetallic substances. AgCl in hardness and d. during rolling resembles metals; changes in color of Cu-Ag-Au alloys are reproduced in colors of PbO or ZnO produced by rubbing and removable by annealing at 550° (Rüh, *Z. anorg. Chem.* **50**, 265(1906); Tafel, *Ann Physik* **11**, 613(1903)). Other examples are radiation effects on deformed NaCl (Przibram, *C. A.* **26**, 1842), pressure effects on phosphorescence of sulfides (P. Waentig, *Z. physik. Chem.* **51**, 435(1905), H. Kuggenheim, *Ann. Physik* **70**, 116(1923), Beutel and Kutzelnigg, *Sitzber. Akad. Wiss. Wien.*, IIb, **141**, 447(1932)), lowering of initial temp of gray radiation of salts by rubbing (Tammann, *C. A.* **27**, 893), increase in soly. of rubbed materials (salicylic acid)(Cohen, *C A.* **27**, 459). B. J. C. VAN DER HOEVEN

**Plastic elongation of α-iron crystals.** W. FAHRENHORST AND E. SCHMID. *Mitt. deut. Materialprüfungsamt Sonderheft* **21**, 52–7(1933).—The mechanism of deformation of α-crystals was investigated by tensile tests at room temp. and at —185°. The crystallographic translation is detd. as $T = \{123\}$ and $t = [111]$ at room temp. while at the lower temp. hardly any translation can be observed. The tests are illustrated by diagrams and x-ray patterns. 10 references. Also in *Z. Physik* **78**, 383–94(1932). M. HARTENHEIM

**Measurement of mechanical properties of binary inorganic salt mixtures.** K LAYBOURN AND W. M. MADGIN. *Trans. Faraday Soc.* **28**, 857–66(1932).—Transverse breaking strength, compression strength, and Brinell hardness were measured for the binary salt mixts. $NaNO_3/KNO_3$, $Pb(NO_3)_2/NaNO_3$ and $Pb(NO_3)_2/KNO_3$. Property *vs.* compn. diagrams are of the same general forms in all 3 systems. The special conditions of casting, annealing and surface treatment necessary to obtain consistent results are stated. WILLIAM J. KROEGER

**Remark on the papers by F. Zwicky on the structure of real crystals.** E. OROWAN *Z. Physik* **79**, 573–82(1932).—Zwicky's suggestion of a secondary crystal structure becomes unnecessary if an error in his calcn. is corrected. (Cf. *C. A.* **23**, 1792, 3138; **24**, 1005, 3410; **25**, 243, 4162.) EGON BRETSCHER

**Precision determination of lattice constants of non-cubic substances.** W. STENZEL AND J. WEERTS. *Z. Krist.* **84**, 20–44(1933).—A method is described that allows direct correction for all systematic errors, resulting in an accuracy of about ±0.01%. New detns. are as follows: Cd $a = 2.9736 \pm 0.0005$ A. U., $c = 5.6058 \pm 0.0005$ A. U.; Zn $a = 2.6590 \pm 0.0005$ A. U., $c = 4.9351 \pm 0.0009$ A. U.; Mg $a = 3.2022 \pm 0.0002$ A. U., $c = 5.1991 \pm 0.0004$ A. U.; Re $a = 2.7553 \pm 0.0004$ A. U., $c = 4.4403 \pm 0.0003$ A. U.; β-Sn $a = 5.8194 \pm 0.0003$ A. U., $c = 3.1753 \pm 0.0009$ A. U. L. S. RAMSDELL

**Vacant positions in the iron lattice of pyrrhotite.** GUNNAR HÄGG. *Nature* **131**, 167–8(1933).—The excess of S in the homogeneous solid solns. of S in FeS contg. 50–55.5 atoms % S may be caused by an increasing no. of vacant positions occurring at random in the Fe lattice rather than direct substitution of S for Fe. The d., calcd. on this assumption by means of the lattice dimensions obtained by x-ray measurements,

agrees with the observed d. values. The hexagonal superstructure contg. 12 Fe and 12 S atoms exhibited by FeS disappears rapidly as S increases. JANET E. AUSTIN

**Crystal lattice distortion in stretched wire.** W. A. WOOD. *Nature* **129**, 760–1 (1932); cf. *C. A.* **26**, 3218. G. G.

**Crystalline structure of göthite.** S. GOLDSZTAUB. *Compt. rend.* **195**, 964–7 (1932).—The coördinates of the Fe and O atoms in göthite are given as detd. from relative intensities of spots on Fe *K* and Mo *K* radiation diagrams by using the analogy between göthite and hematite and diaspore. H. W. WALKER

**An x-ray study of the wüstite [FeO] solid solutions.** ERIC R. JETTE AND FRANK FOOTE. *J. Chem. Physics* **1**, 29–36(1933).—A series of Fe oxides with compns. between 76.08 and 76.72% Fe, all lying within a single-phase solid-soln. area known as wüstite, was prepd. and the lattice consts. and ds. of the individual members were detd. The NaCl structure previously ascribed to FeO is found throughout the series. Contrary to earlier results the size of the unit cell decreases as the Fe content decreases. The solid soln. is of a complex type. An O ion replaces an FeO group with an accompanying increase in valence of $2Fe^{++}$ to $2Fe^{+++}$. GEORGE L. CLARK

**X-ray study of some borides.** G. ALLARD. *Bull. soc. chim.* **51**, 1213–15(1932).—An x-ray study, by the powder method, of the borides $MB_6$, where M is Ca, Sr, Ba, La, Ce, Nd, Gd, Er, Yb, Yt or Th. Their isomorphism was established. Each has a simple cubic lattice, with an atom of metal at the top of the lattice and an octahedral $B_6$ at the center. LOUISE KELLEY

**X-ray studies of the system: nickel–oxygen–water. I. Nickelous oxide and hydroxide.** R. W. CAIRNS AND EMIL OTT. *J. Am. Chem. Soc.* **55**, 527–33(1933).—Several new modifications of NiO reported in the literature are identical. The lattice parameter of pure NiO is given as $a_0 = 4.1684 \pm 0.0001$ A. U. The lattice parameters for hexagonal $Ni(OH)_2$ are given with improved accuracy as $a_0 = 3.114 \pm 0.005$ A. U. and $c_0 = 4.167 \pm 0.005$ A. U. The 2 crystal forms of $NiSO_4$ previously thought to represent 2 different modifications are identical. The existence of previously reported hydrates of $Ni(OH)_2$ is disproved. **II. Compounds containing trivalent nickel.** *Ibid* 534–44.—X-ray diagrams for the compds. $Ni_2O_3 \cdot H_2O$ and $Ni_2O_3 \cdot 2H_2O$ are given. These are not true hydrates but the water is bound as hydroxyl groups. Structural formulas and x-ray diagrams are given for 2 compds. of Ni, O and $H_2O$ at lower stages of oxidation. HOWARD AGNEW SMITH

**The structure of α-zinc hydroxide.** W. FEITKNECHT. *Z. Krist.* **84**, 173–6(1933).—$\alpha$-$Zn(OH)_2$ is isomorphous with the other hydroxides of bivalent metals of the C-6 type. X-ray data give $a = 3.14$ A. U., with $c$ uncertain. The ratio $a:c$ is about 1.63. The polymorphism of $Zn(OH)_2$ is due to the strong polarizing effect of the Zn ions on the OH ions. L. S. RAMSDELL

**The habit and crystal structure of potassium bitartrate.** A. FERRARI AND R. CURTI. *Z. Krist.* **84**, 8–13(1933).—Crystals of $KHC_4H_4O_6$, obtained by slowly dropping HOAc into Rochelle salt, show a new habit, with a large development of (110) and (101) and a small (100), (010), (001) and (031). With $H_3PO_4$ the crystals were poorly formed and twinned. The unit cell has the dimensions $a = 7.614$ A. U., $b = 10.70$ A.U. and $c = 7.80$ A.U. and contains 4 mols. The C chains probably lie parallel to the $b$ axis. L. S. RAMSDELL

**The space group of afwillite.** C. GOTTFRIED. *Z. Krist.* **84**, 172–3(1933).—Laue and rotation photographs of afwillite indicate a monoclinic cell contg. 4 mols. $3CaO \cdot 2SiO_2 \cdot 3H_2O$, with $a = 11.39$ A.U., $b = 5.47$ A.U., and $c = 13.09$ A.U. Space group $C_2^2$. Plates cut normal to (010) show a distinct piezoelec. effect. L. S. RAMSDELL

**The structures of the perchlorates of potassium and ammonium.** C. GOTTFRIED AND C. SCHUSTERIUS. *Z. Krist.* **84**, 65–73(1933).—$KClO_4$ and $NH_4ClO_4$ are orthorhombic bipyramidal; space group $V_h^{16}$. The unit cells, contg. 4 mols., have $a = 8.834 \pm 0.006$ A.U., $b = 5.650 \pm 0.004$ A. U., $c = 7.240 \pm 0.005$ A.U. and $a = 9.202 \pm 0.006$ A. U., $b = 5.816 \pm 0.004$ A.U., $c = 7.449 \pm 0.005$ A. U., resp. Each K (or $NH_4$) is surrounded by 12 O atoms at an av. distance of 3.02 A.U. (3.12 A.U.) and each Cl by 4 O atoms in an irregular tetrahedron with av. O — O = 2.36 A.U. (2.42 A. U.) and Cl — O = 1.44 A. U. (1.49 A. U.). L. S. RAMSDELL

**The crystal structure of lithium sulfate.** JOHN G. ALBRIGHT. *Z. Krist.* **84**, 150–8(1933)(in English).—Laue and oscillation photographs indicate a monoclinic unit cell for $Li_2SO_4$ contg. 4 mols. with $a = 8.25$ A. U., $b = 4.95$ A. U., $c = 8.44$ A.U. and $\beta = 107° 54'$. Space group $P2_{1a}$ ($C_{2h}^5$). The parameters are given. The $SO_4$ groups form regular tetrahedra with S–O = 1.50 A. U. and O–O = 2.45 A. U. Li atoms are surrounded by 4 O atoms, each from a different sulfate group, forming nearly regular tetrahedra with the av. distance Li–O = 1.97 A. U., and O–O = 3.20 A. U. L. S. RAMSDELL

**The crystal structure of lead bromide.** W. NIEUWENKAMP AND J. M. BIJVOET.

*Z. Krist.* **84**, 49–61(1933).—A new structure type for compds. of the type $AB_2$ is found for $PbBr_2$. (Cf. *C. A.* **22**, 4288.) Pb has a coördination no. 9, and Br 4 and 5. The type is intermediate between $CaF_2$ and $CdI_2$. The Br ions have a distorted hexagonal arrangement, and are of 2 types, not crystallographically equiv. All ions are at the 4-fold positions *Ouv*; $u, \bar{v}$; *o*, $v$; $^1/_2, \bar{u}, ^1/_2 + v$, with $u$ and $v$ for Pb = 0.015 and 0.087, for $Br_1$ = 0.61 and 0.075; for $Br_2$ = 0.23 and —0.17, resp. The values of $n_0$ are 2.434 $\|c$, 2.476 $\|b$, and 2.553 $\|a$. L. S. RAMSDELL

**The crystal structure of lead fluoride.** J. A. A. KETELAAR. *Z. Krist.* **84**, 62–4 (1933).—The low-temp. modification of $PbF_2$ is orthorhombic, and isomorphous with $PbBr_2$ (cf. preceding abstr). There are 4 mols. in the unit cell with $a$ = 3.80 ± 0.01 A. U., $b$ = 6.41 ± 0.02 A. U., and $c$ = 7.61 ± 0.03 A. U. Calcd. d. = 8.75. Direct d. detns. are too low, because powder photographs always reveal some of the cubic modification present. L. S. RAMSDELL

**The crystalline structure of β-arabinose.** ERNEST G. COX. *Z. Krist.* **84**, 45–8 (1933)(in English).—The conclusions of Andress and Reinhardt (*C. A.* **25**, 5815) as to an open-chain structure for β-arabinose are shown to be incorrect on the basis of their own intensity measurements, as well as those of C., and also because of the general chem. nature of arabinose. L. S. RAMSDELL

**Studies on adsorption—methods of obtaining saturated vapors.** L. J. BURRAGE. *Chem. News* **145**, 206–11(1932).—Three methods are given for obtaining an air stream satd. with a certain vapor at a given partial pressure. Method I gives details for a system which could be employed for obtaining pressures of water vapor up to 18 mm. Method II is designed to sat. an air stream by passage over an org. liquid at a definite temp. The third method is a modification of the second in that the substance satg. the air stream is a solid instead of a liquid. L. H. REYERSON

**Sorption of gases, vapors and mists.** H. REMY. *Angew. Chem.* **46**, 101–4(1933).—A discussion of the problems of *aerochemistry*. Exptl. data are presented and the relationships of adsorptivity of gases to b. p., crit. temp. and vapor pressure are shown The only simple relationship is that between adsorptivity and vapor pressure. Eleven literature references are given. KARL KAMMERMEYER

**The equilibrium of atoms and ions adsorbed on a metal surface.** R. C. EVANS *Proc. Cambridge Phil. Soc.* **29**, 161–4(1933). Becker's theory of the evapn. of adsorbed atoms and ions of alkali metals from hot metal surfaces is extended so as to apply to non-equil. conditions. The theory is applied to interpret expts. on the evapn. of alkali metals adsorbed on hot W. MORRIS MUSKAT

**Sorption of water vapor by glass.** E. P. BARRETT AND A. W. GAUGER. *J. Phys Chem.* **37**, 47–51(1933).—The adsorption of $H_2O$ on glass was measured at 25–30° at relative humidities between $1 \times 10^{-3}$ and $3 \times 10^{-2}$. P. H. EMMETT

**An improved method for the determination of isothermals by the retentivity technic.** L. J. BURRAGE. *J. Phys. Chem.* **37**, 33–9(1933).—An improved technic for detg. isothermals of vapors on solids is described. The desorption isotherms obtained for $CCl_4$ and for $H_2O$ on charcoal and on $SiO_2$ gel consist of a series of rectangular steps. P. H. EMMETT

**Characteristics of different adsorbents.** Z. V. VOLKOVA. *J. Phys. Chem* (U. S. S. R.) **3**, 368–74(1932).—Adsorption of mixts. of substances follows the Langmuir adsorption isotherm. Curves of adsorption of mixts. of MeOH-$C_6H_6$, and PrOH-$C_6H_6$ by $SiO_2$ gel, nephelite gel and bauxite were detd. The Williams formula $U = [N(C_0 - C)/m(100 - C)] - [W C/(100 - C)]$ was used. F. H. RATHMANN

**The adsorption of negative ions by a colloidal suspension of aluminum hydroxide.** BEN H. PETERSON AND FLOYD H. TRIMBLE. *Proc. Iowa Acad. Sci.* **38**, 165–6(1931); cf. *C. A.* **24**, 1008; **25**, 1721.—The adsorption of ferricyanide and oxalate ions by colloidal $Al(OH)_3$ at concns. below and above the coagulation values was measured. The graph of the amt. adsorbed as a function of the total concn. of the electrolyte shows 3 characteristic "breaks." The results are of the same general type as those obtained by Storks in the adsorption of the chromate ion by the same suspension. The adsorption is considered as of 2 types; (*1*), a neutralization of the pos. charges on the colloidal particle, followed by (*2*) surface adsorption by the coagulated particle. The second "break" is due to a combination of the two types of adsorption. W. G. GAESSLER

**Adsorption of oxalic acid by alumina.** PHILLIP H. DEWEY. *J. Phys. Chem.* **36**, 3187–8(1932).—Neither HOAc nor $(COOH)_2$ forms a compd. with an Al catalyst at room temp., but $(COOH)_2$ is more highly adsorbed, and cannot be readily washed out, although it can be detd. by hot acid permanganate titration. JEROME ALEXANDER

**Sorption of ammonia by silver chloride.** HACHIRO HEMMI. *J. Chem. Soc. Japan* **53**, 841–6(1932).—The velocity of sorption of $NH_3$ by AgCl was measured between —18° and 65°; it decreases with increasing temp. No sorption was observed above 65°. The velocity of sorption of $NH_3$ by AgCl prepd. by removing $NH_3$ *in vacuo* from AgCl.

$3NH_3$ was much greater than with freshly prepd. AgCl. By measuring the amt. of sorption and desorption the transition points of $AgCl.3NH_3$ and of $2AgCl.3NH_3$ were detd. as 16.8° and 66.3°, resp. T. KATSURAI

**Discontinuities in the sorption process.** L. J. BURRAGE. *J. Phys. Chem.* **37**, 41–5(1933).—Sorption isotherms of $H_2O$ over 3 different charcoals at 15° consist of rectangular steps. P. H. EMMETT

**The adsorption of gases by active charcoal.** H. REMY AND W. HENE. *Kolloid-Z.* **61**, 314–22(1932).—The adsorption of $CO_2$, $O_2$, $SO_2$, $COCl_2$, MeCl, $Cl_2$, $H_2S$, HCl, $C_2H_2$, $N_2O$, $N_2$, $CH_4$ and $NH_3$ by moisture-free active charcoal was detd. at 15° and 1 atm. pressure. For the gases below the crit. temp., the vol. adsorbed decreases with increase in the vapor pressure of the liquid. With change in temp., the isotherms for $SO_2$, $NH_3$, $CO_2$ and $CH_4$ are linear when the log of the adsorbed vol. is plotted against the temp. Adsorption from mixts. can be calcd. only as the summation of the individual components when the individual adsorbed vols. are nearly alike. A. FLEISCHER

**A test of adsorption equations on the basis of adsorption measurements on a highly active charcoal.** E. L. LEDERER. *Kolloid-Z.* **61**, 323–8(1932); cf. preceding abstract. The logarithmic isotherm equation and Langmuir's equation show deviations at higher pressures for gases above the crit. temp. The data are not reproduced by the usual isobaric equations or by Polanyi's equation. Extrapolation of $SO_2$ and $CO_2$ data gave satisfactory agreement with Gurwitsch's rule. The equation $\log V = \log V_k - \zeta \log \varphi$, where $V$ is the vol. of adsorbate, $V_k$ the vol. adsorbed at crit. state, $\zeta$ is a const., and $\varphi$ the reduced vapor pressure, reproduces the isobaric exptl. data. A. FLEISCHER

**Adsorption from solutions of electrolytes by ash-free adsorbent charcoal.** E. J. MILLER AND S. L. BANDEMER. *Mich. Agr. Expt. Sta., Rept. for the Two Years Ending June 30, 1932*, 22; cf. *C. A.* **25**, 629. —Adsorbed acids can be quantitatively removed from C by electrodialysis. The removal of the adsorbed acid by this method, however, leaves the C able to take up alkali from solns. of NaOH or KOH, a property which C free from adsorbed acid does not acquire when electrodialyzed under identical conditions. Possibly complex org. acids on the surface of the C after removal of the chloride are responsible for the adsorption of the alkali. Ash-free adsorbent C gives neg. adsorption from solns. of such alkalies as KOH and NaOH. The magnitude of the neg. adsorption depends upon the length of time the C is in contact with the soln. C. R. FELLERS

**Influence of some chemical and physical factors on the activity of charcoal. III. Influence of alkali impregnation.** E. V. ALEKSEEVSKIĬ AND YA. S. PIKAZIN. *J. Gen. Chem* (U. S. S. R.) **2**, 327–34(1932); cf. *C. A.* **24**, 4683. —Samples of powd. C were kept in contact with 1.0 and 0.1 *N* solns. of NaOH, KOH, LiOH, $NH_4OH$, and also with satd. solns. of $Ca(OH)_2$, $Sr(OH)_2$ and $Ba(OH)_2$, for a period of 7 days at room temp. The samples were then filtered, without washing, dried at 100° and degassed in a glass tube at 450° by means of a vacuum pump. A sample treated with $NH_4OH$ suffered a reduction in its ash content, while in the other samples the ash increased in the following ascending order: LiOH, NaOH and KOH for the 1.0 and 0.1 *N* solns. and $Ca(OH)_2$, $Sr(OH)_2$ and $Ba(OH)_2$ for the satd. solns. Tests made with $C_6H_6$ vapor showed that in all cases, except where the samples were impregnated with 1.0 *N* NaOH, 1.0 and 0.1 *N* KOH, adsorption was greater than in the non-treated C. With chloropicrin there was an increase of adsorption with samples treated with 0.1 *N* NaOH and 1.0 *N* KOH, but not with the sample treated with 1.0 *N* NaOH. With $C_2H_2$, $NH_4OH$ treatment increased adsorption, while in all other cases there was a decrease. Adsorption of iso-AmOH from soln. was increased with LiOH-treated sample; in all other cases the samples acted as hydrophilic adsorbents. Adsorption of PhOH from soln. was increased by treatment of the C with 1.0 *N* NaOH and 0.1 *N* LiOH. In all other cases there was either only a slight increase or a decrease in adsorption. **IV. Influence of impregnation with ammonium salts on activity of charcoal.** *Ibid* 335–40.—Satd. solns. of $NH_4$ salts and a 25% soln. of $NH_4OH$ were used in treating samples of C in the same manner as above, except that impregnation lasted for 4 months. $NH_4$ salts, contg. a non-volatile anion, like $(NH_4)_2HPO_4$ and $(NH_4)_2MoO_4$, increased the ash content of the C. For adsorption of $C_6H_6$ vapor and $C_2H_2$, impregnation of samples with $NH_4$ salts either had no effect or lowered the adsorptive activity (particularly in the case of $NH_4$-CNS). Adsorption of 0.1 *N* PhOH from soln. was decreased except in the case of $NH_4NO_3$ impregnation, while in the case of 0.1 *N* iso-AmOH adsorption, some treated samples were hydrophobic and some hydrophilic. S. L. MADORSKY

**The adsorption of electrolytes by calcium carbonate in a neutral aqueous medium.**

soln. with $CO_2$ to neutrality, (*7*) satg. a 15% sugar soln. contg. 3% CaO with $CO_2$ until neutral, (*8*) satg. a 3% CaO soln. with $CO_2$ to 0.1% CaO. Other prepns. used were: (*9*) prepn. *8* dried at 105°, (*10*) prepn. *8* boiled with distd. $H_2O$ until neutral and kept moist, (*11*) prepn. *10* dried at 105°, (*12*) prepn. *10* moistened but not washed, (*13*) ground limestone. Aragonites were prepd. in the same forms by pptg. at 85°. One hundred cc. of a soln. (*a*) $CaSO_4$ 0.253 g. per 100 cc., (*b*) Ca asparagate 267.3 mg. per 100 cc. or (*c*) Ca citrate 127.7 mg. per 100 cc. was treated with 3 g. of the above $CaCO_3$ prepns. for 15 min at 20°, filtered, and measured for residual electrolyte and elec. cond. The adsorption of the electrolytes by $CaCO_3$ was in the order: Ca citrate > $CaSO_4$ > Ca asparagate and depended on the sensitivity of the electrolytes to the adsorptive substance. The forms 1–5 were ineffective; $CaSO_4$ and Ca asparagate were not adsorbed at all. This method of treatment did not alter the surface of the $CaCO_3$ to change the adsorption. Pulverized limestone did not adsorb at all. The method of prepn. and not the treatment influences the adsorptive power of the $CaCO_3$. The $CaCO_3$ prepd. by satg. with $CO_2$ showed large variations according to the medium from which it was pptd.; $CaCO_3$ pptd. from sugar solns. (forms *7*, *10*, *11*, *12*) was more active than that from aq. solns. (*6*, *8*). $CaCO_3$ (*10*) prepd. in an alk. medium (*10*) was more adsorptive than that washed to neutrality (*7*). Although the differences between the adsorption by moist (*10*, *12*) and dry forms (*11*) was small, the moist form seemed more effective. Calcites prepd. at 20° were more active than aragonites prepd. at 85°; filtration time for the calcite forms was 30% longer than for the corresponding aragonite forms. $CaCO_3$ employed for adsorption did not show any adsorptive power when used a 2nd time. The gravimetric analyses confirmed the cond. measurements. The factors affecting the adsorptive power of $CaCO_3$ are: (*1*) temp. of prepn., (*2*) method of prepn., (*3*) type of medium, (*4*) reaction of the medium and (*5*) reaction of the pptd. $CaCO_3$.

FRANK MARESH

**Linear phenomena. I. Linear wetting and linear adsorption; micellar weight and micelle dimensions of lyophilic colloids.** D. L. TALMUD, B. A. TALMUD AND S. E. BRESLER. *Z. physik. Chem.* **A163**, 91–106(1933); cf. *C. A.* **26**, 354.—The phenomena of linear wetting and adsorption are described. A method for quant. measurement of the latter is also described. Results are given for several substances. From the data, the av. micellar diam. and wt. of lyophilic colloids can be detd. G. M. MURPHY

**Application of the Gibbs adsorption theorem to solid-liquid interfaces.** F. E. BARTELL, F. L. MILLER AND E. G. ALMY. *J. Am. Chem. Soc.* **55**, 466–71(1933).—From adhesion-tension data in Gibbs' adsorption equation the adsorption at solid-liquid interfaces was calcd. Adhesion tensions against $SiO_2$ and interfacial tensions against $H_2O$ were detd. for the systems: $H_2O$–$C_6H_6$, $H_2O$–$C_{10}H_7Br$, $H_2O$–$PhNMe_2$ with dissolved $Et_2CO_3$. The order of max. adsorption is the same whether $SiO_2$ or $H_2O$ is the adsorbent. The area of adsorbed $Et_2CO_3$ mols. was calcd. from the adsorption data and agreement was found for data in 3 solvents with 2 adsorbents. These results justify use of adhesion-tension data for calcg. adsorption at a solid-liquid interface. S. LENHER

**The separation of small amounts of substances in crystallized precipitates. VII. Communication from O. Hahn and co-workers on the precipitation and absorption of small amounts of substances.** ROLF MUMBRAUER. *Z. physik. Chem.* **A163**, 142–54 (1933); cf. *C. A.* **27**, 461.—Ppts. of $Ag_2SO_4$, $Ag_2C_2O_4$, $Ag_2CrO_4$ and $PbCrO_4$ contg. small amts. of Th B and Th X from Pb and Ra, resp., were studied. The results are discussed in relation to previous work. G. M. MURPHY

**Surface activity and orientation of polar molecules. IX. Several experimental contributions on the application of Antonoff's rule, especially to adsorption layers.** A. TAUBMANN. *Kolloid-Z.* **62**, 76–8(1933); cf. *C. A.* **26**, 3980, 5472.—Careful measurements, fulfilling Antonoff's conditions (cf. *C. A.* **26**, 3417) on the systems $H_2O$–$C_6H_6$ and $H_2O$–hexane-*p*-toluidine show that Antonoff's rule is not general. NaOH and KOH are capillary-inactive at the $H_2O$–$C_6H_6$ interface. ARTHUR FLEISCHER

**Active centers on the surface of activated charcoal.** B. BRUNS, E. POZ, A. GOROBETSKAYA AND F. PERELMAN. *Physik Z. Sowjetunion* **2**, 497–510(1932).—See *C. A.* **27**, 216. G. G

**The dependence of wetting of solids on the time of contact.** AGNES POCKELS. *Kolloid Z.* **62**, 1–2(1933); cf. H. Devaux, *C. A.* **26**, 3164, 4742.—Plates of tallow, trimyristin and other org. solids not usually wet by $H_2O$, formed by cooling the liquid on $H_2O$, are wet by $H_2O$ on the face in contact with the water. After drying in air, this face is no longer wet by water. The upper surfaces of the plates cooled in contact with air were partially or completely wet after a contact from 1 to 5 days. Glass, porcelain and other solids showing initial non-wetting behaved similarly. A. FLEISCHER

**Measurement of the concentration and dispersity of suspensions by the photoelectric cell. I, II.** MOTOTARO MATSUI, TOKICHI NODA, SHU KAMBARA AND SHIGERU OYAMADA. *J. Soc. Chem. Ind., Japan* **35**, Suppl. binding, 569–74, 575–7(1932).

Theoretical and exptl. equations are derived and applied to such factory problems as *insol. matter in soda ash*. A circuit diagram for a fairly successful portable set is given. GREGG M. EVANS

**Mercury as dispersion medium.** N. M. CHUĬKO. *Ukrain. Khem. Zhur.* **6**, No. 5–6, Sci. Part, 229–40(1931).—Fe amalgams were shown to be colloidal solns. True amalgams retard or accelerate their coagulation. Measurements of change of viscosity of Fe amalgams with addn. of amalgams of Zn and Sn showed that the viscosity of the system is greater before sedimentation than after, while the viscosity of true amalgams is nearly that of pure Hg. The acceleration of sedimentation of the Fe in the presence of Zn results not from change in viscosity, but from growth of the size of the Fe particles. It is suggested that the stability of Fe suspensions depends upon the p. d. of Fe and Hg. Preliminary expts. of cataphoresis indicated that Fe is charged positively. J. G. T.

**Application of the double-layer theory of Otto Stern. I.** FRANK URBAN AND H. L. WHITE. *J. Phys. Chem.* **36**, 3157–61(1932).—In dil. solns. $\zeta$-potential and surface cond. are related. Evidence indicates that the ions of the inner Helmholz layer are mobile; further, that the assumption $\eta_1 \gg \eta_2$ in dil. solns., made by Stern to calc. $\Phi_+$ and $\Phi_-$, is not justified. JEROME ALEXANDER

**Dielectric behavior of colloidal particles with an electric double layer.** J. B. MILES, JR., AND H. P. ROBERTSON. *Phys. Rev.* **40**, 583–91(1932).—Math. B. C. A.

**A correlation of stream potentials and surface conductance.** H. L. WHITE, FRANK URBAN AND E. A. VAN ATTA. *J. Phys. Chem.* **36**, 3152–6(1932).—The stream potentials with capillaries of 0.005 mm. diams. are 0–25% greater than with large capillaries, not 75–80% greater as previously reported (*C. A.* **26**, 1495). The latest low figures are unexplainable by the classical stream-potential equation, or by any suggested modification. Prerequisite to correlating surface cond. and stream potential is the establishment of conditions for normal stream potential. The $\zeta$ potential may vary without changing surface cond., but the former is calculable from the latter, and *vice versa*. Briggs' conclusion from univalent-cation expts. (cf. *C. A.* **23**, 748, 3141) that surface cond. is not a function of the $\zeta$ potential, may mean that in his expts. the diffuse layer is less pronounced and varies more with concn. than is the case with glass surfaces. Here the $\zeta$ potential is no index of the charge d. until the distribution of charges between the components of the double layer is detd. JEROME ALEXANDER

**The specific conductivity of intermicellar liquid of gold sols.** ROBERT WINTGEN AND WILLY HACKER. *Kolloid-Z.* **61**, 335–44(1932); cf. *C. A.* **21**, 3516.—Negligibly small differences between the sp. cond. of the intermicellar liquid and of formol Au sols were found when the intermicellar liquid was sepd. by ultrafiltration, balanced dialysis, centrifuging and by freezing. This checks the calcns. of v. Hevesy (*C. A.* **12**, 1434). Au sols of concn. as high as 2.7 g. per l. were prepd. by collecting the residues in centrifuging the sols. The electrolyte concn. in these sols can be regulated within wide limits. A. FLEISCHER

**Preparation and properties of highly concentrated sols. II. Sols of vanadium pentoxide, silicic acid and molybdic acid.** C. AHOBALACHARYA AND N. R. DHAR. *J. Indian Chem. Soc.* **9**, 441–53(1932); cf. *C. A.* **27**, 10.—The viscosity of $V_2O_5$ and $SiO_2$ sols increases considerably with their purity. With the pure sols, the viscosity-concn. curves are very steep and resemble those of some lyophilic colloids. The viscosity of even a concd. sol of $MoO_3$ is practically the same as that of $H_2O$. The ratio of the coagulating concns. of KCl and $BaCl_2$ decreases with the purity of sols of $V_2O_5$ and $MoO_3$ $SiO_2$ sols can be coagulated by KCl and $BaCl_2$ only when sensitized by $NH_4OH$ or other alkali. In this case the ratio of the pptg. concns. of KCl and $BaCl_2$ increases with the purity of the sol. The sensitizing influence of $NH_4OH$ on $SiO_2$ sols is more pronounced on its coagulation by bivalent than by univalent ions. Moreover, the increased purity of $SiO_2$ sols affects more markedly their coagulation by bivalent than by univalent ions. These 2 properties appear to be related and are peculiar to $SiO_2$ sols. With $SiO_2$ sols the ratio of the coagulating concns. of KCl and $BaCl_2$ is smaller at 60° than at 30°, while with $V_2O_5$ and $MoO_3$ the reverse holds, especially when the sols are freshly prepd. The properties of these sols are more complex than those of other hydroxide sols, because these sols always contain the respective acid in the dissolved condition and have a tendency to agglomerate into sol particles. **III. Sols of zirconium hydroxide.** R. D. SHARMA AND N. R. DHAR. *Ibid* 455–61.—By hydrolysis of concd. solns. of $Zr(NO_3)_4$ followed by hot dialysis of the solns., highly concd. sols were obtained contg. 0.8172 g. mol. $ZrO_2$ per l. with a purity (*i. e.*, $ZrO_2/NO_3$) of 6.6, and 0.4502 g. mol. $ZrO_2$ per l. with a purity of 16.2. These concd. sols are highly viscous, and the greater the purity of the sol, the greater its viscosity. The viscosity of these sols decreases when their elec. charge is increased by the addn. of $Zr(NO_3)_4$ soln. The visocsity-concn. curves of these concd. sols are steep; the purer the sol the steeper the curve. The ratio of the coagulating concns. of $KBrO_3$ and $K_2SO_4$ increases when $Zr(NO_3)_4$ is added to

stabilize the sols. The surface tension of the concd. sols is appreciably less than that of $H_2O$. The sp. cond. of the sols increases on aging. When the concd. sols are allowed to dry slowly in the dark, the dry residue swells on the addn. of $H_2O$ and passes into the sol again. H. W. LEAHY

**Relation between charge and stability of colloidal solutions of gold and ferric hydroxide dialyzed to different extents.** B. N. DESAI, G. M. NABAR AND P. M. BARVE. *J. Indian Chem. Soc.* 9, 463–9(1932).—Nothing warrants the view that charge and stability are not related to each other. The abnormal behavior shown in any case can be traced to the part played by the similarily charged ions. It is not safe to draw conclusions about the charge on colloidal particles from the results of stability as detd. by flocculation values, although in some cases flocculation values may serve as a useful criterion. H. W. LEAHY

**Berlin blue hydrosols.** E. L. LEDERER AND O. HARTLEB. *Kolloid Z.* **62,** 42–6 (1933).—Sols are decolorized and coagulated by heating, by visible and ultra-violet light, and by $\beta$-rays. The time of flocculation by irradiation is proportional to the layer thickness and sol concn.; the optimum wave length is 420 m$\mu$. Electrolytes decrease flocculation time. Up to a concn. of 0.2 per 1000, Beer's law is followed. A. F.

**Colloid studies of dye sols. IV.** RYUKICHI TANAKA. *J. Soc. Chem. Ind., Japan* **35,** Suppl. binding, 547(1932).—Heating Congo-red acid changes it from blue to red, which is permanent at room temp. for a concn. of 0.496 mg./100 cc., but higher concns. approach blue again on cooling. This is attributed to changes in particle size, assocn., and increased activity. GREGG M. EVANS

**Measurement of migration velocities of colloidal particles.** W. HACKER. *Kolloid Z.* **62,** 37–42(1933).—An inherent difficulty in the method of moving boundaries is caused by mixing of electrolyte soln. and sol and by changes in concn. due to differences in the migration velocity of the ions, with subsequent inaccuracy in the detn. of the potential gradient at the boundary. To obtain sharp boundaries it is necessary at the upward moving boundary that the migration velocity of the micelle ion be less than that of the similarly charged ion of the electrolyte soln., and that the sp. cond. of the electrolyte be greater than that of the sol. The conditions are fulfilled when the micelle ion concn. is very small, and the intermicellar liquid is used as the electrolyte, and in the case where the intermicellar liquid contains several electrolytes, as in a Zsigmondy formol Au sol. ARTHUR FLEISCHER

**The measurement of migration velocities of gold micelle ions by observation of moving boundaries.** W. HACKER. *Kolloid-Z.* **62,** 66–78(1933); cf. preceding abstract.—Cataphoretic migration velocities of Au micelles were calcd. from moving-boundary observations and from detns. of the amts. of Au transported in definite times, and the values agreed for both limbs of the U-tube. The potential gradient at the boundary was const. during the expts. ARTHUR FLEISCHER

**The diffusion of colloidal electrolytes—sodium oleate.** M. E McBAIN. *J. Am Chem. Soc.* **55,** 545–51(1933); cf. *C. A.* **25,** 1139.—General equations for diffusion are given, showing diffusion proportional to osmotic pressure and not to activity. Primary particles of Na oleate are found not much larger than those of K laurate. The viscosity and gelatinizing power of Na oleate is due to loose linking of primary particles. High diffusion coeffs. for soaps were measured. L. P. HALL

**Causes of the thixotropy of certain sols.** PAUL BARY. *Compt. rend.* **196,** 183–4 (1933).—Thixotropy in $Fe_2O_3$ hydrosols is attributed to formation of a network of micelles polymerized in chains with the network of fine enough mesh for surface tension to offer a considerable obstacle to the escape of liquid. The min. concn. at which such a network can form is such that the length of the micelles is equal to the av. distance between micelles. The network is weak enough to be easily broken down by agitation. F. L. BROWNE

**Viscosity and the molecular weights of polymeric materials.** ELMER O. KRAEMER AND FRANK J. VAN NATTA. *J. Phys. Chem.* **36,** 3175–86(1932).—Careful measurements of the viscosities of solns. of polymeric hydroxydecanoic acids with mol. wts. from 780 to 25,200 inclusive show a simple relationship between viscosity and mol. wt. over a wide range, in qual. agreement with Staudinger's observations on numerous polymeric series. S.'s quant. equation for this relationship requires modification, for it breaks down in the range of high mol. wts. (above 15,000) with the polymeric $\omega$-hydroxydecanoic acids. Therefore S.'s values for the mol. wts. of rubber, cellulose and other very high polymers are unreliable. JEROME ALEXANDER

**Comparison of organic inhibitors in chain reactions.** KIA-KHWE JEU AND HUBERT N. ALYEA. *J. Am. Chem. Soc.* **55,** 575–88(1933).—The photopolymerization of vinyl acetate was studied by detn. of the I no. with Wijs soln. The equation $(1/t)\ \ln[1/(1-x)] = K/(k_2 + kC)$ where $x$ = fraction reacting during time $t$, $K$ = a composite of the no. of chains initiated at $t = 0$ and the probability of continuing the chains and

$k_2 + kC$ is the probability of breaking the chains by a factor $k_2$ or by an inhibitor of concn. $C$ and power $k$, reproduces the photopolymerization of vinyl acetate, the thermal autoxidation of $Na_2SO_3$ and the photolysis of $H_2O_2$. Among 70 org. compds. examd. as inhibitors a max. of 20% photosensitization to visible light was found. Chain lengths may be predicted from the values of $k_2$. S. LENHER

**The influence of Brownian movement on the viscosity of suspensions.** R. EISENSCHITZ. *Z. physik. Chem.* **A163,** 133–41(1933).—An exact hydrodynamic calcn. is given for the theory of the viscosity of suspensions of ellipsoidal particles. G. M. M.

**Attainment of stationary concentrations between two membranes.** J. P. WERRE. *Kolloid Z.* **62,** 16–20(1933); cf. *C. A.* **26,** 1849, 4996.—Math. A. FLEISCHER

**The properties of Becquerel membranes.** J. J. BICKERMAN. *Kolloid Z.* **62,** 26–31(1933); cf. *C. A.* **25,** 2895. A. FLEISCHER

**The explanation of several membrane processes (Becquerel phenomena, negative osmosis, abnormal permeability, etc.).** KARL SÖLLNER. *Kolloid Z.* **62,** 31–7(1933); cf. *C. A.* **23,** 4394; **25,** 2341. A. FLEISCHER

**Harmonic concentration differences across a membrane.** J. STRAUB. *Kolloid Z.* **62,** 13–16(1933); cf. *C. A.* **23,** 3842. A. FLEISCHER

**Dried collodion membranes.** LEONOR MICHAELIS. *Kolloid Z.* **62,** 2–10(1933); cf. *C. A.* **21,** 525, 2837, 3008.—The specifically different behavior of these films to anions and cations is due to the elec. properties of collodion films, which are always negatively charged in aq. solns. A. FLEISCHER

**Osmotic pressure and membranes. I.** SUSUMU HIRONAKA. *Japan. J. Med. Sci. IV Pharmacol.* **6,** 157–201(1932).—The osmotic behavior of true body fluids toward collodion membranes was studied by new methods that are described. The actual values of the osmotic pressures were very small as compared with the theoretical values according to van't Hoff. The osmotic pressures of graduated concns. of electrolytes gave anomalous values in accord with Loeb (*C. A.* **14,** 676) and Bartell and Carpenter (*C. A.* **17,** 1572). This anomalous behavior can have no biol. significance, since salt concns. in living cells are too high. The osmotic pressure of nonelectrolytes was proportional to the concn. and to the mol. wt. Urea (I) shows a neg. osmotic pressure in higher concns., as do Et urethan and formamide. The addn. of I lowers the osmotic pressure of solns. of sugar or NaCl. The lowering of the osmotic pressure cannot be attributed to narcotics only. Curves showing the rate of flow of the soln. through the membrane are more complicated than the osmotic-pressure curves, and there is no direct relationship between the two. T. H. RIDER

**Electroösmosis and electrophoresis. II.** NIKOLAUS SCHÖNFELDT. *Z. Elektrochem.* **39,** 103–16(1933); cf. *C. A.* **26,** 5473.—A review. G. G.

**Rhythmic crystallization produced by the diffusion of alkali carbonates into gelatin.** SUZANNE VEIL. *Compt. rend.* **196,** 109–10(1933).—When a drop of concd aq. $Na_2CO_3$, $K_2CO_3$ or $Li_2CO_3$ is placed on a gelatin gel, fine microscopic strata appear around the drop. Later, larger secondary rings are produced and the first fine lines disappear. The appearance is exactly similar to the micro forms observed by Hofsass (*C. A.* **14,** 1917) in the absence of gelatin, and thus supports the view that a gel is not essential for the formation of such structures. Since they are apparently identical with Liesegang rings, the latter do not depend upon a pptn. reaction for their appearance. K. V. THIMANN

**Action of adsorption layers on disperse systems. III. The action of surface-active substances on the crystallization processes in Liesegang rings.** NADINE SERB-SERBINA. *Kolloid-Z.* **62,** 79–85(1933); cf. *C. A.* **25,** 630.—Liesegang rings of $Ag_2Cr_2O_7$ and $PbI_2$ formed on slides from soln. and powder were observed microscopically. Saponin and iso-AmOH increase the degree of dispersity and uniformity of the crystals, and decrease the distance between the rings. Gelatin above 0.3% concn. causes the crystals to flow with diffusion streams and destroys periodicity. NaOH and HCl below 0.001 $N$ do not change the periodicity. Surface-active sol. substances increase dispersity by decreasing crystn. velocity. Hydrophilic colloids also change the crystal form. The effects are important in the study of boiler-scale preventives. ARTHUR FLEISCHER

**An elastometric method for swelling measurement.** A. W. HOCHLOFF. *Kolloid-Z.* **61,** 364–5(1932).—The method of v. Hahn (cf. *C. A.* **19,** 764), using the Schade app., is an especially sensitive procedure. A. FLEISCHER

**Structure of cellulose gel. IV. The mechanism of sorption of vapors by cellulose gels.** KATSUMOTO ATSUKI, HIROSHI SOBUE AND KOZO KITAJIMA. *J. Soc. Chem. Ind., Japan* **35,** Suppl. binding No. 12, 584–7(1932); cf. *C. A.* **26,** 4228.—The sorption of various vapors by cellulose is caused by adsorption and swelling, the former being affected by the vapor pressure, surface tension and d. of the liquid; the latter by the polarity of the OH groups and O bridge in the cellulose mol. A thermodynamic consideration is given. C. E. HRUBESKY

**Viscosity investigations for the examination of the constitution of natural products of high molecular weight and of rubber and cellulose.** H. STAUDINGER. *Trans. Faraday Soc.* **29**, 18–32(1933); cf. *C. A.* **27**, 1504.—Review and discussion. F. U.

**Relations between the refractive indices and the behavior of cellulose fibers.** J. M. PRESTON. *Trans. Faraday Soc.* **29**, Pt. 1, 65–77(1933).—The *n*s of native, mercerized and regenerated cellulose fibers are related to the orientation of the cellulose micelles of which the fibers are built. Mercerization of cellulose fibers produces changes of *n* that depend on whether the fibers are mercerized under tension or without it. The contraction of fibers mercerized without tension can be calcd. The extensibility of regenerated rayons can be calcd. from the *n*s of the fibers. FRANK URBAN

**Shaking effect in cellulose solutions and other sols detected by means of Tyndall light.** R. O. HERZOG, O. KRATKY AND E. PETERTIL. *Trans. Faraday Soc.* **29**, Pt. 1, 60–4(1933).—Because of thixotropic effects, solns. of cellulose, polystyrol, gelatin, sol. starch, blood serum, and "Hg sulfosalicylic acid" show a different angle of depolarization after vigorous shaking. FRANK URBAN

**Surface films of cellulose derivatives on aqueous solutions.** N. K. ADAM. *Trans. Faraday Soc.* **29**, 90–110(1933); cf. *C. A.* **26**, 898.—The spreading of Me, Et and benzyl ethers of cellulose, of cellulose nitrates, acetates and esters with other fatty acids up to 18 C atoms in length, was studied by measurements of surface pressure and area and by ultramicroscopic examn. of the films. All ethers spread completely on water, the esters incompletely, to films one glucose group in thickness. Conclusions: (*a*) The chains lie with every glucose ring nearly flat on the water, (*b*) the chains are flexible, and may be vibrating vigorously, in some cases, in the plane of the surface at low compressions, (*c*) the differences in ease of spreading are partly due to the different adhesion of the esterified or ether groups to the water and partly to the lateral adhesion between the chains in the solns. of the cellulose derivs The spreading of some common plasticizers was studied alone, and mixed with benzylcelluloses and nitrocelluloses. All expts. are of interest in connection with the problem of detg. the *range of mol. attraction.* FRANK URBAN

**Researches on the change in the lattice of nitrocellulose.** JEAN-JACQUES TRILLAT *Trans. Faraday Soc.* **29**, Pt. 1, 85–9(1933).—X-ray diagrams of nitrocellulose layers drying at 70° show the gradual disappearance of numerous Debye-Scherrer rings. The change in the trinitrocellulose lattice is attributed to successive unidirectional contractions of the lattice originally swollen with solvent. Incompletely nitrated cellulose films are amorphous. FRANK URBAN

**Buffer properties of pectin.** S. A. GLIKMAN. *J. Applied Chem.* (U. S. S. R.) 5, 628–33(1932); cf. *C. A.* **26**, 3424.—Expts. show that the buffer action of pectin is due to cations in the mol. that are replaced by $H^+$ to form a weakly ionized pectic acid V. KALICHEVSKY

**Aging phenomena in gelatin films and their elimination.** R. O. HERZOG AND F. KOREF. *Kolloid-Z.* **62**, 91–2(1933).—Gelatin-nitrocellulose films, losing the property of absorbing moisture by the formation of an irregular scaly film, are regenerated by immersion in a 3–5% pancreatin soln. Addn. of the enzyme in making the film prevents the scaling. ARTHUR FLEISCHER

**The influence of lyotropic substances on the mutarotation and gelatinization of gelatin–water mixtures (investigated at equilibrium).** J. R. KATZ AND J. F. WIENHOVEN. *Rec. trav. chim.* **52**, 36–46(1933).—Previous workers have studied the effect of lyotropic substances on the gelatinization process, but their results probably cannot be used to det. the effect on the equil. sol $\rightleftharpoons$ gel. The effects on the mutarotation of 1% gelatin solns. ($p_H$ = 6.7) of *N* solns. of the ions CNS, I, $NO_3$, Br, Cl, $SO_4$, F and of $(NH_2)_2CO$, $(NH_2)_2CS$, $HOCH_2CO_2Na$, $HSCH_2CO_2Na$, $AcNH_2$, $MeCSNH_2$, $XCH_2CO_2Na$ (X = Cl, Br or I), AcONa, $XCH_2CH_2OH$, EtOH, $Cl_2CHCO_2Na$, $CCl_3CO_2Na$, $CCl_2C(OH)_2H$, $Me(CH_2)_2CO_2Na$, $Me(CH_2)_3CO_2Na$, $C_3H_7OH$, $C_4H_9OH$, BzONa, $PhSO_2Na$, and Na pyrogallate were measured at 15° and 35°. The series is listed in the order of decreasing favorable effect on the reaction sol. $\rightleftharpoons$ gel. All of the compds that favor sol formation are capillary-active substances, *i. e.*, they lower the capillary const. of $H_2O$. It is postulated that the lowering of mutarotation is due to strong polar adsorption at the interface gelatin-$H_2O$. J. V. VAUGHEN

**The binding of biocolloids. XIV. Adsorption of starch on different emulsion surfaces.** Z. HONOWICZ. *Biochem. Z.* **257**, 344–50(1933); cf. *C. A.* **27**, 1019.—Adsorbed starch undergoes denaturation which is regarded as a dehydration process. The starch accumulating on the surface of fat changes from the sol. state to a state of suspension. The addn. of HCl which reduces greatly the elec. charge of the starch micelles increases the amt. of adsorption. Starch is also adsorbed at the interface amyl alc.-$H_2O$, and this is increased by $CaCl_2$. At the interface $H_2O$-liquid paraffin there is no adsorption. It follows therefore that adsorption occurs only when the

emulsifying component is made up of polar mols. ($CH_nOH$, COOH, COOR, etc.). S. MORGULIS

**Physical chemistry of biocolloids.** G. MALQUORI. *Arch. sci. biol.* (Italy) **17**, 87–97(1932).—A review of the recent literature. P. F. METILDI

**The solubility of nitrates in anhydrous acetic acid.** ARTHUR W. DAVIDSON AND HARRIET A. GEER. *J. Am. Chem. Soc.* **55**, 642–9(1933).—Measurements were made of the soly. of $NH_4NO_3$, $NaNO_3$ and $AgNO_3$ in HOAc over a wide range of temps., and of $Ba(NO_3)_2$ at 30°. The soly. of these salts decreases in the order named. No solvates were isolated from any of the solns. P. T. NEWSOME

**Solubility of hydrogen and helium in liquid ammonia.** V. V. IPAT'EV AND V. P. TEODOROVICH. *J. Gen. Chem.* (U. S. S. R.) **2**, 305–10(1932); cf. *C. A.* **26**, 3425.—The solubilities of $H_2$ in cc. per 100 cc. liquid $NH_3$ were found to be 97.3, 610.6, 1218.5 and 1575.0, at 15, 100, 200 and 250 atm., resp. at 25°. Measurements at temps. varying between —15° and +25°, at 100 atm. showed that the soly. rises with temp. The solubilities of He in liquid $NH_3$ at 20°, in cc. per 100 cc., were 11.56, 45.9 and 75.22, at 5.2, 23.0 and 38.3 atm., resp. Measurements at —16° to +30°, at 34.55 to 39.2 atm. showed that the soly. of He rises with temp. The soly. coeff. of $H_2$ varies between 606.0 and 648.6, and that of He between 178.0 and 249.9. In general, soly. of $H_2$ in liquid $NH_3$ follows Henry's law. S. L. MADORSKY

**The solubilities of polythionates. I. Solubilities of potassium polythionates.** A. KURTENACKER AND W. FLUSS. *Z. anorg. allgem. Chem.* **210**, 125–34(1933); cf. *C. A.* **25**, 656.—The following solubilities were found: $K_2S_3O_6$ at 0°, 8.14%, at 20°, 18.43%; $K_2S_4O_6$ at 0°, 12.60%, at 20°, 23.18%; $K_2S_5O_6.1.5H_2O$ at 0°, 15.50%, at 20°, 24.78%. Because of decompn. of the salts insufficient time may have elapsed in most cases for satn. of solns. and the results are subject to an error of 2% or less. Solns. were analyzed before there was any evidence of decompn. H. B. VAN VALKENBURGH

**Solubility studies. IV. The solubilities of certain slightly soluble organic compounds in water.** PAUL M. GROSS, JOHN H. SAYLOR AND MARY A. GORMAN. *J. Am. Chem. Soc.* **55**, 650–2(1933); cf. *C. A.* **25**, 3544.—The solubilities in $H_2O$ of $Et_2CO$, $CH_2Br$-$CH_2Cl$, $CH_2(CH_2Cl)_2$, Et adipate, PhF, *o*- and *p*-$O_2NC_6H_4OMe$, *o*- and *m*-$O_2NC_6H_4NH_2$, $CH_2(CH_2Br)_2$, cinnamic acid, *o*-, *m*- and *p*-$O_2NC_6H_4Me$ $(CHBr_2)_2$ and PhI were detd. P. H. EMMETT

**The solubility of metallic lithium in liquid ammonia at low temperatures.** WARREN C. JOHNSON AND M. M. PISKUR. *J. Phys. Chem.* **37**, 93–9(1933).—The vapor pressures of solns. of Li in liquid $NH_3$ were detd. at several temps. The soly. of metallic Li increases from 10.698 g. per 100 g. of $NH_3$ at —63.5° to 11.319 at 0°. P. H. E.

**The solubility of certain substituted benzoic acids in typical salt solutions at 25°.** J. N. PEARCE AND J. W. NEWSOME. *Proc. Iowa Acad. Sci.* **38**, 163–4(1931).—The solubilities of *o*-, *m*- and *p*-aminobenzoic acids, of *o*-, *m*- and *p*-hydroxybenzoic acids and of *o*- and *m*-nitrobenzoic acids in typical salts solns. at 25° were detd. The salts were NaCl, $BaCl_2$, $K_2SO_4$ and $MgSO_4$. The activity coeffs., $S_0/S$, were calcd. In general, the activity coeffs. tend to pass through a min. and then to increase rapidly with increase in the salt concn. While the chlorides of Ba and Na show the same general tendency to increase the activity coeffs. of these acids, exactly the reverse is true of the two sulfates. The influence of the sulfates is attributed to the formation of the $HSO_4^-$ ion. The greater decrease in the activity coeffs. in the presence of $K_2SO_4$ is attributed to the greater hydration of the Mg ion. W. G. GAESSLER

**The vapor pressures of aqueous solutions of lithium nitrate at 25°.** J. N. PEARCE AND A. F. NELSON. *Proc. Iowa Acad. Sci.* **38**, 164(1931); cf. *C. A.* **26**, 5247.—The vapor pressure of aq. solns. of $LiNO_3$ at 25° was measured by the dynamic method for concns. ranging from 0.1 *M* to satn. The activities of the solute and solvent were calcd. The activity coeffs. of the salt were calcd. by means of the "*h*" function of Lewis and Randall. The free energy of diln. was also calcd. The activity coeff. has a min. at about 0.6 *M*. The same thermodynamic properties for aq. solns. of KCl, KI and NaBr were recalcd. and compared. W. G. GAESSLER

**Some physical properties of aqueous salt solutions.** J. N. PEARCE AND M. A. HOOPER. *Proc. Iowa Acad. Sci.* **38**, 164(1931); cf. *C. A.* **25**, 4171.—The *n*s of solns. of the alkali halides and nitrates were detd. at 25° and from these the sp. refractivities of both the soln. and solute were calcd. by means of the Lorenz-Lorentz formula. The partial molal vols. were also calcd. from d. data. The dielec. consts. of the solns., calcd. by means of the Hückel relation involving *n*, decreased with increase in concn., the values for all salts approaching the same small value at satn. The activities calcd. according to the equation given by Hückel for concd. solns. of strong electrolytes agreed qualitatively with exptl. values. W. G. GAESSLER

**Diffusion in liquids. I.** REINHOLD FÜRTH. *Z. Physik* **79**, 275–9(1932).—The importance of diffusion measurements for the theory of liquids, the strong electrolytes,

etc., is pointed out. **II. A microdiffusion apparatus for uncolored liquids.** RUDOLF ZUBER. *Ibid* 280–90.—The diffusion of a solute into the solvent is studied by measurements of $n$ by the method of total reflection; the connection between concn. and $n$ having been detd. previously. The app. can be mounted on an ordinary microscope and permits detg. the law of diffusion in half an hr., while the usual methods require days. The construction and manner of manipulation are described. **III. Diffusion measurements on electrically neutral liquid mixtures and solutions.** *Ibid* 291–305.—Concd. solns. do not obey Fick's law, but conform to Boltzmann's differential equation of diffusion $\partial c/\partial t = \text{div}\ (D\ \text{grad}\ c)$. This variation of the diffusion coeff. $D$ with concn. $c$ was detd. for a no. of aq. solns. A suitable math. method was developed to obtain $D$ from the measurements with the app. described above. The mixts. studied were solns. of *sugar, urea, glycerol* and *formamide* in *water*. The diam. of the dissolved particles is calcd. from Einstein's formula of $D$ and studied as a function of the concn. **IV. Measurements of diffusion in electrolytes.** RUDOLF ZUBER AND KURT SITTE. *Ibid* 306–19.—The diffusion measurements are extended to the following electrolytes: *LiCl, LiBr, NaCl, NaBr, NaI, KCl, KBr, KI*. In close analogy to *C. A.* **24**, 770, 5206, the viscosity of electrolytes increases for small concn. and decreases again for larger concns. The first fact is supposed to be due to the increase of "ion atmosphere," while the latter is explained by assocn. in the sense of Bjerrum-Born. **V. Theory of diffusion in solutions of strong electrolytes.** KURT SITTE. *Ibid* 320–44.—Born's theory of ion mobility is modified by taking into account the existence of the ion atmosphere characteristic of the Debeye-Hückel theory. Satisfactory agreement is obtained with exptl. results on the variation of viscosity with concn. Nernst-Planck's theory of diffusion in electrolytes is modified in the same sense by using as approximation Bjerrum's conception of assocn. Excellent agreement is obtained with the diffusion expts. This permits calcg. the assocn. as a function of concn. for the salt solns. mentioned above. EGON BRETSCHER

**The viscosity of aqueous solutions as a function of the concentration.** GRINNELL JONES AND SAMUEL K. TALLEY. *J. Am. Chem. Soc.* **55**, 624–42(1933).—A new method for the automatic measurement of the time of flow of a liquid in a viscometer of the Ostwald type by means of a photoelec. cell is described. The timing mechanism was accurate to 0.01 second. The viscosities of dil. aq. solns. (0.1 to 0.0002 $M$) of KCl, $KClO_3$, $KBrO_3$, $KNO_3$, $NH_4Cl$, $CsNO_3$, sucrose and urea were detd. at 25°. The results confirm the prediction made by Jones and Dole (*C. A* **23**, 5375) that all salts increase the viscosity of water if measured at sufficiently low concn., including those salts that give a diminished viscosity at moderate concns. P. T. NEWSOME

**Diamagnetism of water at different temperatures.** A. P. WILLS AND G. F. BOEKER. *Phys. Rev.* **42**, 687–96(1932).—The results of different observers for the diamagnetism of water at different temps. are discordant. *A new and very sensitive device called a manometric balance* is described, by which variation of the sp. susceptibility of $H_2O$ with temp. can be investigated. Expts. with freshly boiled $H_2O$ indicated less diamagnetism at temps. higher than 23.5°, and with similar water allowed to stand several days in contact with He gas indicated greater diamagnetism at temps. higher than 23.5°; the change in the sp. susceptibility was less than 1% in each case. B. L.

**Influence of crystalline fields on the susceptibilities of salts of paramagnetic ions. II. The iron group, especially nickel, chromium and cobalt.** ROBERT SCHLAPP AND WM. G. PENNEY. *Phys. Rev.* **42**, 666–86(1932); cf. *C. A.* **26**, 5233.—The paper is concerned with the calcn. of the paramagnetic susceptibility of highly hydrated crystals of the Fe group elements Ni, Cr and Co. BERNARD LEWIS

**Paramagnetism of the dissolved cobalt ion.** R. MERCIER. *Compt. rend.* 196, 164–6(1933).—The coeff. of magnetization of the dissolved Co ion was measured by a sensitive torsion balance. By using very dil. solns. (0.02–0.001 $N$) of $CoCl_2.6H_2O$ in pure MeOH, the errors due to mol. assocn. were eliminated. The magnetic moment of the $Co^{++}$ ion was found to be 23.9 Weiss magnetons at 273°K., 22.3 at 259°, 21.3 at 228°, 20.6 at 210°, 19.1 at 193° and 18.1 at 177°K. Within exptl. error these values agree with the requirements of the Van Vleck-Stoner theory. W. W. STIFLER

**Some properties of homogeneously distorted cubic ferromagnetic lattices.** FRANCIS BITTER. *Phys. Rev.* **42**, 697–708(1932).—The problem is treated with especial reference to the crystallographic symmetry. Application is made to the magnetostriction and magnetization of samples of Fe, Ni and their alloys under tension and compression. The agreement with expt. is qualitatively satisfactory. A brief discussion of the effect of magnetization on elastic properties and of hysteresis is given and a few important problems are listed. BERNARD LEWIS

**Magnetic susceptibility of ferrosilicons rich in silicon.** CH. BEDEL. *Compt. rend.* **196**, 262–4(1933).—By means of a Cheveneau-Curie magnetic balance, the magnetic susceptibilities of a no. of ferrosilicons were measured. The Si content varied

from 34.64 to 99.86%. These were all found to be paramagnetic. The value of $\chi \times 10^6$ for the 1st is +163.70. For 46.53% Si it is 4.63. It then increases to a max. of 112.28 for 49.80% Si and then decreases rapidly. Heat treatments of various sorts alter the values of $\chi$ greatly, but it seems to be established that there is a definite max. in the neighborhood of 50% Si, corresponding to the existence of the compd. $Si_2Fe$ as found by Lebeau and by Phragmen by x-ray analysis. W. W. STIFLER

**Electrolytic water transfer in sodium iodide solutions. The role of parchment paper membranes in the electrolysis of aqueous solutions of alkali and alkaline earth halides.** G. BABOROVSKY AND A. WAGNER. *Z. physik. Chem.* **A163**, 122–32(1933); cf. *C. A.* **22**, 4034.—Electrolytic $H_2O$ transfer and true transference no. were detd. in aq. solns. of *M* and 0.1 *M* NaI by a modified Remy method. The behavior of parchment membranes in the electrolysis of salt solns. is discussed. G. M. MURPHY

**Transference and conductivity studies on solutions of certain proteins and amino acids with special reference to the formation of complex ions between the alkaline earth elements and certain proteins.** SADAICHI MIYAMOTO AND CARL L. A. SCHMIDT. *J. Biol. Chem.* **99**, 335–58(1933); cf. *C. A.* **25**, 2042.—Transference nos. were detd. and cond. measurements made with solns. of the Na and Ca compds. of casein and dephosphorized casein, and the Na, Ca and Ba salts of aspartic and glutamic acids. The conductivities of aspartic acid, glutamic acid and glycine also were detd. Within the limits of accuracy of the expts. the Na salts of casein, dephosphorized casein, aspartic acid and glutamic acid, and the Ca and Ba salts of aspartic and glutamic acids, do not yield complex ions. Solns. of the Ca salts of casein and dephosphorized casein yield complex Ca-contg. anions to the extent of about 50 and 40%, resp. The $H_3PO_4$ in solns. of casein is the seat of complex Ca ions to the extent of about 10%. The hypothesis is advanced that solns. of casein in alk. earth bases yield complex ions as a result of step dissocn. Solns. of aspartic acid, glutamic acid and glycine obey Ostwald's diln. law only in extremely high dilns. L. E. GILSON

**Anomalous electrolytes. I. The electrical conductivity of solutions of iodine and cyanogen iodide in pyridine.** L. F. AUDRIETH AND E. J. BIRR. *J. Am. Chem. Soc.* **55**, 668–73(1933).—The conductivities of solns. of CNI and I in $C_5H_5N$ increase rapidly with time, approaching max. values, presumably because of the transformation of pseudo salts into quaternary iodopyridinium salts. Abnormally high $\lambda$ values for I in $C_5H_5N$ are explained by the following equil.: $Py.I_2 \rightleftharpoons I^- + IPy^+ \rightleftharpoons Py^{++} + 2I^-$ (*A*). Diln. increases the concn. of the ternary electrolyte *A*. L. F. AUDRIETH

**Limiting mobilities of some univalent ions and the dissociation constant of acetic acid at 25°.** A. I. VOGEL AND G. H. JEFFREY. *Nature* **131**, 27–8(1933).—The authors defend previous work (cf. *C. A.* **26**, 5817) against a recent criticism by MacInnes, *et al.* (*C. A.* **27**, 652) by citing their exptl. agreement with Kohlrausch and Maltby's results for KCl, NaCl and $KIO_3$. The use of 0.490 for the cation transport no. of KCl is decided upon. Extrapolation to infinite diln. by the use of the empirical formula of Shedlovsky (cf. *C. A.* **26**, 2911) is criticized. WILLIAM J. KROEGER

**The relation between the higher-charge ions and the deviations from the first approximation of the Debye-Hückel theory.** J. B. CHLOUPEK, VL. Z. DANEŠ AND B. ANNE DANEŠOVA. *Collection Czechoslov. Chem. Communications* **4**, 473–9(1932).—The soly. of $Ce(IO_3)_3$ was detd. in pure water (1.732 g./1000 g. $H_2O$) and in the following salt solns. at 25°: $KNO_3$ 0.005–0.5 *M*, $K_2SO_4$, $MgSO_4$ and $MgCl_2$, 0.002–0.1 *M*. E. R. SMITH

**The application of antimony and manganese electrodes for $p_H$ measurements.** I. I. ZHUKOV AND YU. A. BOLTUNOV. *J. Gen. Chem.* (U. S. S. R.) **2**, 407–14(1932).—The Sb electrode is affected by org. acids and, therefore, has no advantage over the $H_2$ electrode. However, it should be preferred in some cases where it is desired to keep the liquid undisturbed, also with gels. The Mn electrode is of no lab. interest, since it is affected by a no. of substances and changes with time. S. L. MADORSKY

**The application of the hydrogen and quinhydrone electrodes in mixed solvents. I.** I. ZHUKOV AND I. G. VOROKHOBIN. *J. Gen. Chem.* (U. S. S. R.) **2**, 399–406(1932).—The $p_H$ of various aq. solns. to which varying amts. of MeOH, EtOH, $Me_2CO$ and $C_3H_5(OH)_3$ were added, was detd. by means of $H_2$ or a quinhydrone electrode set against a standard satd. calomel electrode. The addn. of MeOH, EtOH and $Me_2CO$ increases the $p_H$, whether in acid or basic medium, which agrees with the work of Michaelis and Mizutani. However, of the two electrodes, the quinhydrone gives the lower $p_H$. Addn. of $C_3H_5(OH)_3$ to buffer solns. has no effect on the $p_H$ when measured with the $H_2$ electrode, but depresses it slightly when the quinhydrone electrode is used. This agrees well with the work of Kolthoff on the effect of sugar on buffer solns. S. L. MADORSKY

**The influence of acid concentration on the oxidation-reduction potential of mixtures of ferric and ferrous sulfates in sulfuric acid solution.** THOMAS J. GLOVER. *J. Chem. Soc.* **1933**, 10–15.—Data presented show a logarithmic relation between the e. m. f. of

oxidation-reduction cells and the ratio $Fe^{+++}:Fe^{++}$ at 20° and 60°. The temp. coeff. of the $FeSO_4$-$Fe_2(SO_4)_3$ electrode increases from $6.51 \times 10^{-4}$ at 0.1 *N* $H_2SO_4$ to about $10 \times 10^{-4}$ at *N* and then remains practically const. up to 10 *N*. The reaction is endothermic, the heat of reaction increasing from —2503 cals. at 0.1 *N* to —4877 cals. at *N*. The calcd. oxidation-reduction potentials are for 0.1 *N* $H_2SO_4$ and *N* $H_2SO_4$, resp.; 0.9548 and 0.9559 at 20°; 0.9798 and 0.9961 at 60°. This is opposite to the change of $FeCl_2$-$FeCl_3$ cells. It is suggested that $Fe^{+++}$ and $Fe^{++}$ combine with ions or undissocd. substances to form complex ions that vary in amt. or compn. with acid concn. and that, if slightly dissocd. may entirely displace the original system under some conditions.

FOSTER DEE SNELL

**Electrolytic reduction potential of organic compounds. XIII. Azobenzene.** MASUZO SHIKATA AND ISAMU TACHI. *J. Agr. Chem. Soc. Japan* **8**, 954–61(1932); *Bull. Agr. Chem. Soc. Japan* **8**, 75–6(1932); cf. *C. A.* **27**, 220, 1280.—The reduction potential of azobenzene was measured with the dropping cathode. Apparently there is reversible azo-hydrazo system in the range $p_H$ 1.2–5.0. When the stationary Hg cathode with a cathodic surface area of 0.785 sq. mm. was used, the same value was obtained and the polarograms showed a max. current, because of the accumulation of the reduction product on the cathode. The reduction potential measured by the Pt cathode with the surface area of 0.785 sq. mm. was about 150–200 mv. and more neg. than in the other cases.

Y. KIHARA

**The application of the van't Hoff-Le Chatelier-Braun principle to chemical equilibria.** K. POSTHUMUS. *Rec. trav. chim.* **52**, 25–35(1933).—A math. discussion based on the second law of thermodynamics, and illustrated graphically. The opinion that in order to displace a chem. equil. as far as possible toward one side, a great excess of one of the components on the other side must be added, is not generally correct, nor does it generally represent greatest efficiency and economy.

R. H. CHERRY

**The dissociation pressures of magnesium ammonium phosphate hexahydrate and some related substances. VII.** SAMUEL J. KIEHL AND HENRY B. HARDT. *J. Am Chem. Soc.* **55**, 605–18(1933); cf. *C. A.* **21**, 3573.—The dissocn. pressures for the following systems were detd.: $MgNH_4PO_4 \cdot 6H_2O$, $MgNH_4PO_4 \cdot H_2O$, $H_2O$ (below 60°); $MgNH_4PO_4 \cdot 6H_2O$, $MgNH_4PO_4 \cdot H_2O$, $MgHPO_4 \cdot 3H_2O$, $H_2O$, $NH_3$ (above 60°); $MgNH_4PO_4 \cdot H_2O$, $MgNH_4PO_4$, $Mg_2P_2O_7$, $NH_3$, $H_2O$; $MgHPO_4 \cdot 3H_2O$, $MgHPO_4 \cdot H_2O$, $H_2O$. The results show that $MgNH_4PO_4 \cdot 6H_2O$ loses 5 mols. of $H_2O$ at a very low temp when heated. No $NH_3$ is noticeable in the gaseous phase below 60°. The monohydrate loses both its $H_2O$ of hydration and its $NH_3$ when heated at about 250° in an open vessel.

P. T. NEWSOME

**Reactions in solid phases.** HANS TRAPP. *Metallbörse* **22**, 1629–30(1932).—The general problems connected with a study of reactions in solid phases are discussed. The reaction of Fe and C is interpreted as resulting from the diffusion of C through the Fe phase to the Fe-Fe oxide interface; a possible part played by the equil. $2CO = CO_2 + C$ is also mentioned. Several solid reactions exist in which the diffusion mechanism rather than any gas-phase reaction is apparently involved. *Ibid* **23**, 1–2(1933). The relationship of the shrinking and sintering of metals at high temps. to the mechanism by which reactions can occur in the solid phase is discussed. *Ibid* **23**, 34–5.—Various types of solid-phase reactions, particularly those occurring between iron oxide and silica, are discussed.

P. H. EMMETT

**Oxidation of phosphine with oxygen and air in the presence of hydrogen.** I. N BUSHMAKIN, A. A. VVEDENSKIĬ AND A. V. FROST. *J. Gen. Chem.* (U. S. S. R.) **2**, 415–20 (1932).—At 300° at 60–96 atm., $PH_3$ combines quantitatively with $O_2$ from the air in the presence of $H_2$ to form $H_3PO_3$ and $H_3PO_4$ in a few min. There is no explosion as long as the amt. of $PH_3$ is below 9% of that of $H_2$ and the mixt. is free from P and $P_2H_4$. At 20°, it takes days to complete this reaction. In this case the rate of reaction is independent of the partial pressures of $PH_3$, $H_2$ and $N_2$, but is directly proportional to the pressure of $O_2$.

S. L. MADORSKY

**Equilibrium in the molten state between alkali and alkaline earth metals and their salts.** E. RINCK. *Ann. chim.* **18**, 395–531(1932).—Equil. in the molten state was studied for the following systems: Na, K, NaOH, KOH; Na, K, NaCl, KCl; Na, K, NaBr, KBr; Na, K, NaI, KI and Na, K, NaF, KF. The glass tubes, charged with various mixts., were sealed in steel and then heated. All of the above systems consist of 2 homogeneous liquid phases: (1) a light layer of the Na-K alloy and, (2) a heavy layer, a mixt. of the 2 compds. The law of mass action holds. Variations in the values of the equil. consts. were found due to analytical errors caused by the soly. of the alkali metals in their compds. and also due to secondary reactions. The ds. of K and Na at various temps., *t*, were found to be: $d_t = 0.826 - 0.000222\ (t - 62.5)$ for K, and $d_t = 0.9385 - 0.000260\ (t - 96.5)$ for Na. The reaction: $2Na + CaCl_2 \rightleftharpoons Ca + 2NaCl$ was studied at 712°, 850°, 975° and 1100°. Na and Ca are miscible in all pro-

portions above 1180°. A transformation of solid Ca at 450° was found; the α form is stable below 450° and the β form is stable between 450° and the m. p., 848°; the transformation of α to β takes place with an absorption of heat of about 7 cal./g. Two forms of Ba were found with the α-form stable below 375°, the heat absorbed in the transformation being about 1 cal./g. E. G. VANDEN BOSCHE

**The reaction between the citrate radical and calcium ion.** GIUSEPPE PERETTI. *Arch. sci. biol.* (Italy) **17**, 126–41(1932).—In a system contg. const. total vols., a fixed quantity of $CaCl_2$ and variable quantities of citrate radical, the min. quantity of the citrate radical able to prevent pptn. of the Ca ion by its common pptg. agents was detd. This min. of citrate varies considerably with $p_H$. Above $p_H$ 6 it is about 1.5 or 2 mols. of citrate per mol. of $CaCl_2$; it increases rapidly with a diminishing $p_H$, approaching 12–14 mols. of citric acid at $p_H$ 3.5; it then diminishes rapidly to 2–3 mols. of citric acid in the zone $p_H$ 2.6–1.4. These variations may be due really to a change in $p_H$. The abs. values of the mol. ratio citrate radical/$CaCl_2$ obtained, however, depend strictly on the conditions of the expt. In fact, for a const. $p_H$, the ratio increases with increase in (*a*) time of reaction, (*b*) abs. concn. of citric acid and $CaCl_2$ and (*c*) concn. of oxalate used as indicator of free Ca. P. F. METILDI

**Reduction equilibrium of metallic oxides. III. Confirmation of the existence of the solid solution between $W_2O_5$ and $WO_3$.** L. WÖHLER, ZEN-ICHI SHIBATA AND R. KUNST. *J. Chem. Soc. Japan* **54**, 37–43(1933).—Solid soln. between $W_2O_5$ and $WO_3$ is confirmed. $W_2O_5$ alone exists as an intermediate product between $WO_3$ and $WO_2$; there is no $W_4O_{11}$. **IV. A new precise method of determination of the reduction equilibrium between metallic oxide and hydrogen.** ZEN-ICHI SHIBATA AND ICHIRO MORI. *Ibid* 44–9.—A modification of Deville's method of studying the reduction of metallic oxide is described together with an improved method of measuring the partial pressure of $H_2$. The error in the measurement is reduced to one tenth of that of Deville's method. **V. Free energy changes of the reactions: $CoO + H_2 = Co + H_2O$ and $Co + {}^1/_2O_2 = CoO$.** *Ibid* 50–8.—For the reaction $CoO + H_2 = Co + H_2O$ $\Delta F_{298.1} = -5450$ cal., $\Delta H_{298.1} = -57{,}820$ cal., and for the reaction $Co + {}^1/_2O_2 = CoO$ $\Delta F_{298.1} = -51{,}612$ cal., $\Delta H_{298.1} = -57{,}234$ cal T. KATSURAI

**The sulfurization of iron by hydrogen sulfide and the equilibria occurring in this process.** L. BIERNER. *Mitt. Forschungsinst. Ver. Stahlwerke A. G. Dortmund* **3**, 41–54(1932). The equilibria $Fe + H_2S \rightleftarrows FeS + H_2$ and $(n - x)\,Fe + n\,H_2S = Fe_{(n-x)}S_n + nH_2$ were investigated in the range of 550–1080°. The position of the equil. changes with increasing temp. in favor of the formation of H. Between 875° and 895° a sudden increase of the H by 25% takes place which seems to point to a change of the sediment. The latter was analyzed for each equil. and showed from 683° to 837° a general compn. corresponding to $Fe_3S_4$, at 875° to $Fe_3S_5$, and at 855° and 905° to FeS. The x-ray examn. of the sediment showed that the permanency of the solid soln. is restricted to a definite temp. range; the solid soln. disintegrates on cooling. 13 references. M. HARTENHEIM

**Thermodynamic evaluation of test results of sulfurization of iron by hydrogen sulfide.** F. EISENSTECKEN AND L. BIERNER. *Mitt. Forschungsinst. Ver. Stahlwerke A. G. Dortmund* **3**, 55–8(1932).—The sudden increase of 25% of S in the small temp. interval of 875–910° (cf. preceding abstract) was investigated by thermodynamic considerations. The sediment corresponds to the compn. FeS only during this temp. interval and deviates from it at other temps., thus causing other reactions and heat contents. Calcns. with the mass law show good agreement. Seven references. M. H.

**Relation between dehydration and hydrolysis of magnesium chloride on heating the crystalline salt.** I. G. SHCHERBAKOV AND A. K. RASPOPINA. *Kalii* (U. S. S. R.) **1932**, No. 10, 16–19; cf. *C. A.* **27**, 1262.—The gradual heating of $MgCl_2.6H_2O$ to 300–350° and then raising the temp. higher to the fusion of the dried salt showed the following relation between $H_2O\%$ ($y$) and MgO ($x$) in the dried product: $-dy/dx = ky^2$. JAMES SORREL

**Absorption velocity of gases by liquids. II. Theoretical considerations of gas absorption due to chemical reactions.** SIROZI HATTA. *Tech. Repts. Tôhoku Imp. Univ.* **10**, 119–35(1932); cf. *C. A.* **24**, 763.—The absorption velocity is reduced to a formula which is a modification of the Lewis and Whitman double film theory, which the author compares with Ohm's law, introducing the terms "absorption potential" and "absorption resistance." **III. Absorption of carbon dioxide by potassium carbonate solutions.** *Ibid* 136–68.—A description of the apparatus is given. As would be expected, the velocity is less than in KOH, and becomes still less in $KHCO_3$. Effects of temp., concn. of gas and liquid, and velocity of stirring of gas and liquid were detd. and are given graphically. GREGG M. EVANS

**Kinetics of adsorption of high-molecular substances from solution by porous powders.** B. V. IL'IN AND N. N. ZHELOKHOVTZEVA. *J. Gen. Chem.* (U. S. S. R.) **2**,

436–41(1932).—The kinetics of adsorption of Me violet from aq. solns. of 0.1, 0.08, 0.06 and 0.04% concn., on powd. blood charcoal, was studied. Charcoal powder heated in boiling water for 2 hrs. and left standing with the water for 2–4 weeks adsorbed more Me violet when the soln. of the latter was introduced into its suspension, than when the dry powder was introduced into the soln. In the formula $A = A_0(1 - e^{\alpha t})$, where $A_0$ and $A$ are the initial concn. of Me violet and the concn. at time $t$, the mean values of the const. $\alpha$ are 0.0188, 0.0596 and 0.144 for concns. 0.1, 0.06 and 0.04, resp., in dry-powder adsorption, and 0.0233, 0.0262, 0.0621 and 0.1161 for concns. 0.1, 0.08, 0.06 and 0.04 in wet-powder adsorption. S. L. Madorsky

**Kinetics of the decomposition of molecules of intermediate complexity.** C. N. Hinshelwood and C. J. M. Fletcher. *Nature* **131**, 24(1933); cf. *C. A.* **26**, 2109.—The existence of different modes of activation of a mol. of intermediate complexity should give distinctly segmented curves of reciprocal half life of the reacting substance *vs.* pressure. Already-published results (*C. A.* **26**, 2109) and work now in progress yield indications of the real existence of such states. William J. Kroeger

**Wave statistical theory of unimolecular reactions.** A. Ganguli. *Current Sci* **1**, 104(1932); cf. *C. A.* **25**, 2053; **26**, 3429.—By a treatment similar to that of a previous paper (cf. *C. A.* **26**, 3429), reaction velocity coeff. expressions are deduced similar to those obtained by Dushman; Polanyi and Wigner; and Roginsky and Rosenkewitsch (Cf. *C. A.* **25**, 2053.) William J. Kroeger

**Unimolecular reaction velocity.** M. G. Evans. *Trans. Faraday Soc.* **28**, 840–5 (1932); cf. *C. A.* **23**, 5407; **25**, 2053; **26**, 2367.—Bourgin (*C. A.* **23**, 5407) and Roginsky and Rosenkewitsch (*C. A.* **25**, 2053) treated unimol. decompn. from the standpoint of the non-classical escape of a system through a potential-energy barrier. Important criticisms were leveled against this treatment by Kassel (*C. A.* **26**, 2367). The author shows that the nature of the energy barrier depends upon the energy of the rest of the mol. and that the probability of escape of the system may be great, thus meeting Kassel's criticisms. William J. Kroeger

**Interaction of carbon monoxide and nitric oxide.** F. F. Musgrave and C. N. Hinshelwood. *J. Chem. Soc.* **1933**, 56–9.—The rate of reaction was measured at 920°. NO does not decompose in the absence of CO. The rate of reaction between CO and NO is proportional to the square of the NO pressure, independent of the CO pressure and not systematically dependent on the area/vol. ratio or the dimensions of the vessel, while $H_2O$ vapor increases the speed approx. in proportion to the partial pressure. In the presence of considerable $H_2O$ (*e. g.*, vapor pressure of 10 mm. and up) the rapid reaction taking place was found to be still nearly independent of the CO pressure and proportional to a power of the NO pressure approaching the second. It is suggested that the mechanism of the change is (*1*) $CO + H_2O = CO_2 + H_2$; (*2*) $2NO + 2H_2 = N_2 + 2H_2O$. (*1*) is a heterogeneous reaction, fast at 900° (*C. A.* **26**, 4747), while (*2*) is homogeneous, taking place at approx. the rate required to explain the results, and is trimolecular (*C. A.* **20**, 2440), the following stages being suggested for it: $2NO + H_2 = N_2O + H_2O$, $2N_2O = 2N_2 + O_2$ (the latter decompn. being very rapid at 900°). Expt'l data are given, and it is shown that most of the results relating to the kinetics of the reaction between CO and NO can be explained by the above hypothesis. E. B. S

**The chlorination of aluminum oxide by chlorine and carbon monoxide.** W. D. Treadwell and L. Terebesi. *Helv. Chim. Acta* **15**, 1353–62(1932).—Above 800° the chlorination of $\gamma$-$Al_2O_3$ by means of Cl and CO is proportional to time, whereas at lower temps. the action is autocatalytic, possibly because of the formation of a layer of active C on the $Al_2O_3$. The rate of chlorination shows a max. at 550° and a min. at 650° (corresponding to the temp. at which transformation of $\gamma$-$Al_2O_3$ into the less active $\alpha$-$Al_2O_3$ takes place). Chlorination with $COCl_2$ is more rapid than with mixts. of CO and Cl. The max. lies within the range of existence of $COCl_2$. The reaction rate falls at higher temps. and approaches that of CO and C at 700°. L. F. Audrieth

**Streaming kinetics. A photolysis model.** Emil Abel and Hermann Schmid *Monatsh.* **61**, 361–4(1932).—The temp. coeff. of a streaming reaction is smaller than that of a "quiet" one. A kinetic interpretation of Beer's law is given. J. B. Austin

**Autoxidation of stannous chloride. II. Survey of certain factors affecting this reaction.** Robt. C. Haring and Jas. H. Walton. *J. Phys. Chem.* **37**, 133–45(1933); cf. *C. A.* **26**, 1850.—Increased temp. increases the rate of autoxidation of $SnCl_2$ but the true temp. coeff. is masked by change in soly. of $O_2$ and changes in the complex equil. Light below 3070 A. U. is absorbed and accelerates the reaction. A peroxide was detected in fresh, partially oxidized $SnCl_2$ but this was destroyed by addn. of more $SnCl_2$. Many org. compds., particularly nitro compds., are inhibitors, picric acid being strongest; this inhibitor was destroyed during the oxidation. Thiourea is a strong pos. catalyst. Powdered willow charcoal showed poisoning and promoted action. Coupled

oxidation of a second mol. species was found in aq. soln. of allyl alcohol and butyraldehyde, and in many non-aq. solns. such as alcs., acids, esters and ketones. I. J. P.

**The kinetics of cuprous oxide sol formation.** Nic. P. Peskov and Elisabeth M. Preis. *Kolloid-Z.* **61**, 328–35(1932); cf. *C. A.* **18**, 5.—The hydrolysis of Cu succinimide solns. of concns. 0.25, 0.50 and 1.0 g. per l. at 35° was followed photometrically. The reaction is monomol. and autocatalytic. The hydrolysis is hindered by succinimide. $Cu(OH)_2$ is pptd. from solns. of the Cu salt by anions. At low electrolyte concns. the ppt. is peptized by succinimide, which at high concns. prevents pptn. by electrolytes. The Cu succinimide soln. is an extremely labile equil. system between a true soln. and a highly dispersed sol. A. Fleischer

**The kinetics of the action of ammonium halides on epichlorhydrin.** Sobhanlal Banerjee and Hemendra Kumar Sen. *J. Indian Chem. Soc.* **9**, 509–18(1932).—In the reaction of $NH_4Cl$ and $NH_4Br$ with epichlorohydrin there was practically no change in the velocity consts. between the range of 2–5 *M* concn. With $NH_4I$ the velocity consts. changed with every change in concn. With higher concns. of any of these halides there are irregularities in the velocity consts., but the velocity is considerably increased with a rise of concn. There is thus a pos. salt effect. H. W. Leahy

**Catalytic decomposition of carbon monoxide. IV. Behavior of nickel carbides.** H. Tutiya. *Bull. Inst. Phys. Chem. Research* (Tokyo) **10**, 951–73(1931); cf. *C. A.* **25**, 5615.—An x-ray investigation of the catalytic decompn. of CO by Ni or NiO has confirmed the formation of $Ni_3C$ and a percarbide, $Ni_xC$. The percarbide is formed from NiO at 270° and rapidly decomposes into $Ni_3C$ and C at 284°; it is also decompd. by atm. $H_2O$ vapor. $Ni_3C$ is quite stable at 285° and catalyzes the decompn. of CO. In the temp. range of stability of $Ni_3C$ the reaction $3Ni + 2CO \rightleftharpoons Ni_3C + CO_2$ is possible, but not the reaction $2CO = C + CO_2$. Free Ni is found in the earlier stages of reduction of NiO, but later changes completely to carbides. B. C. A.

**Catalytic decomposition of carbon monoxide. V. The behavior of molybdenum carbides.** Hirosi Tutiya. *Bull. Inst. Phys. Chem. Research* (Tokyo) **11**, 1136–49 (1932)(*Abstracts* (in English) published with *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) **19**, Nos. 384–92); cf. preceding abstract.—CO was decompd. under various conditions in presence of metallic Mo, its carbides or solid soln. of $Mo_2C$, and solid phases formed of carbides and C were examd. by the x-ray method. $Mo_2C$ is formed at 450–600°; a very diffused diffraction line of C (002) is observed in the powder spectrogram of the reaction product at 600°. Mo and its carbides are not oxidized in CO at 450–800°; CO flowing over the mixt. of $Mo_2C$ and C is decompd. at 600°, C itself having no catalytic property. A new carbide phase, most probably MoC, is formed at 750°. At 750–800°, the mixt. of $Mo_2C$, MoC and C is formed, and CO is decompd. without the existence of metallic Mo; the reaction product at 650–700° contains, besides $Mo_2C$, a metastable carbide phase. K. Konda

**Hydrolysis of salts of the halogen-substituted aliphatic acids in aqueous solution.** H. M. Dawson and N. B. Dyson. *J. Chem. Soc.* **1933**, 49–56.—Kinetic measurements show definitely that the formation of $Br^-$ from aq. $CH_2BrCO_2Na$ results from simultaneous reactions represented by $v = k_1c + k_2c^2$, in which $k_1$ and $k_2$ are velocity coeffs. for the unimol. and bimol. reactions, and $c$ is concn of $CH_2BrCO_2^-$. This is very accurate if measured under conditions that eliminate inert-salt effects and acceleration by the products of the reaction. In the presence of $CH_3CO_2^-$, $HCO_2^-$, $CH_2(OH)CO_2^-$ and $CH_2ClCO_2^-$ the equation must be expanded to $v = v_1 + v_2 + v_3 = k_1c + k_2c^2 + k_3cc'$ in which $c'$ is the concn. of the catalyzing salt and $k_3$ is the corresponding velocity coeff. The value of $k_3$ is a measure of the catalytic effect due to $CH_2BrCO_2^-$, analogous in every way to the value of $k_2$ due to other catalytically active salts. This equation also applies to hydrolysis of $CH_2BrCO_2^-$ in the presence of $OH^-$, although a simple bimol. expression is a close approximation, because $k_3$ is large in comparison with $k_1$ and $k_2$. Foster Dee Snell

**Thermal decomposition of ethyl mercaptan and ethyl sulfide.** Nelson R. Trenner and H. Austin Taylor. *J. Chem. Physics* **1**, 77–88(1933).—EtSH and $Et_2S$ decompose homogeneously at 380–410° and 50–400 mm. pressure in glass poisoned by the reaction products and proceed to a complex equil. (cf. *C. A.* **25**, 868). The rate curves show an induction period which is due to the formation of an intermediate that decomposes unimolecularly with an energy of activation of 40,000 cals. at a rate only slightly less than the rate of formation. The intermediate, b. 48–9.5°, reacts with $HgCl_2$ to form $Et_2S_2(HgCl)_2$ and with NaOH. It is probably a dimercaptan, EtSH:SHEt, formed in either decompn. from $H_2S$ and $Et_2S$. Janet E. Austin

**Homogeneous unimolecular decomposition of mixtures of gaseous aliphatic ethers.** E. W. R. Steacie. *Trans. Roy. Soc. Can.* III, **26**, 103–10(1932); cf. *C. A.* **26**, 3429.—The thermal decompn. of mixts. of $Me_2O$ and $Et_2O$ was studied by observing change in pressure with time in a system at 478° and const. vol. With the assumption of zero

efficiency in mutual activation the ratio of change calcd. to change observed was 1.03. Apparently the reactants have no mutual activation and the rates of decompn. of the sep. reactants are additive. J. W. SHIPLEY

**The velocities of hydrolysis of the three monomethoxydiphenyl ketimines.** JAMES B. CULBERTSON AND AMEL L. BRESSON. *Proc. Iowa Acad. Sci.* **38**, 169–70(1931); cf. *C. A.* **25**, 1231.—The 2- and 3-methoxydiphenyl ketimines were prepd., by the general method of Moureu and Mignonac (cf. *C. A.* **7**, 3114; **15**, 1495). 4-Methoxydiphenyl ketimine was prepd. previously. The velocities of hydrolysis into the corresponding ketones were measured for these monomethoxydiphenyl ketimine hydrochlorides. 2-Methoxydiphenyl ketimine hydrolyzes much less rapidly than the other two. Hydrolysis of the 4-methoxy compd. is definitely slower than that of 3-methoxydiphenyl ketimine. All of these have lower rates of hydrolysis than has diphenyl ketimine hydrochloride. W. G. GAESSLER

**The velocities of hydrolysis of mono- and polyhydroxydiphenyl ketimines.** JAMES B. CULBERTSON AND JAMES L. NAUMAN. *Proc. Iowa Acad. Sci.* **38**, 170(1931); cf. *C. A.* **25**, 1231.—The velocities of hydrolytic decompn. of the three monohydroxydiphenyl, the resorcyl phenyl and the phloroglucinyl phenyl ketimine hydrochlorides were measured. The phenolic group in the 2- and 4-positions in the monohydroxydiphenyl ketimines markedly retards the hydrolysis velocity compared with that of diphenyl ketimine, while the velocity of the 3-hydroxydiphenyl ketimine was even greater than that of the diphenyl ketimine. The polyhydroxydiphenyl ketimines with their hydroxy groups in the 2- and 4-positions have remarkably low rates of hydrolysis. W. G. GAESSLER

**Phase diagrams of several lithium salt melts.** A. A. BOCHVAR. *Z. anorg. allgem. Chem.* **210**, 163(1933).—Phase diagrams of LiCl-LiBr, LiCl-LiF and LiF-LiBr were detd from freezing curves. The av. atomic intervals are for LiF 2.009 A. U.; for LiCl 2.567 A. U.; and for LiBr 2.745 A. U. LiBr and LiCl form a continuous series of mixed crystals, while LiBr-LiF and LiCl-LiF form eutectics. H. STOERTZ

**Cryoscopic studies of the transition points of the compounds of organic solvents with salts. II.** HAZIME OOSAKA. *Bull. Inst. Phys. Chem. Research* (Tokyo) **11**, 1323–9(*Abstracts* (in English) published with *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) **20**, Nos. 398–401); *Science Repts. Tokyo Bunrika Daigaku* **1**, No. 22, 241–9 (1932).—The lowering of the transition point of NaI.3MeOH (26.4°) on addn. of foreign substances was measured and the mol. depression referred to 100 g. of MeOH was calcd. as 20.0 and 18.3 for polar and nonpolar substances, resp. This difference is probably caused by different effects of polarity of solute on the active concn. of MeOH. From the value of mol. depression 20.0, the heat of fusion of this solvate was calcd. as 7276 cal./mol. or 29.6 cal./g. K. KONDA

**Systems of four immiscible liquid layers.** E. LESTER SMITH. *Nature* **131**, 167 (1933).—The system (cf. *C. A.* **25**, 2034) sealed in a tube with Hg and shaken repeatedly for 2 yrs. still seps. into 5 layers. The instability of Partington's specimen (cf. *Nature* **130**, 967(1932)) may result from impure oleic acid, evapn. of hexane, or decompn. of the soap by atm. $O_2$ or $CO_2$. JANET E. AUSTIN

**Catalysis of ion reactions. I. Catalysis of persulfate-iodine ion reactions by cobalt complexes.** ÁRPÁD DE KISS, I. BOSSÁNYI AND A. URMÁNCZY. *Act. Lit. Sci. Univ. Hung. Francisco-Josephinae, Sect. Chem. Mineral. Phys.* **2**, 210–29(1932) (in German).—The measurement of reaction velocities proved that the above reactions follow the neutral-salt law of Brönsted. The connection between accelerating influence and elec. charge of ions is stated. S. S. DE FINÁLY

**Investigations of the role of ozone as catalyst of oxidation. IV. The ozonization of benzaldehyde at a low temperature.** E. BRINER AND H. BIEDERMANN. *Helv. Chim. Acta* **16**, 213–16(1933); cf. *C. A.* **27**, 17.—In earlier work of the authors, errors occasioned by the autoxidation of BzH and by the action of $O_3$ on the solvents required corrections. Of a number of common solvents examd., only AcOH was inert to $O_3$, and this was incompatible with the method. By using $C_2H_5Cl$ at, or below, —30°, both errors were reduced to insignificance, while the catalysis by $O_3$ continued at a reduced rate. The results obtained by the new technic corroborate the previous expts. R. BALTZLY

**Thermal dissociation of gypsum in the presence of catalysts.** I. E. ADADUROV, L. GALAMEEVA, AND D. V. GERNET. *J. Applied Chem.* (U. S. S. R.) **5**, 736–43(1932); cf. *C. A.* **26**, 5001.—Up to 930° dissocn. is due to the increase in mobility of the grating. The change of α-silicic acid to tridymite at 900–1200° is a secondary reaction. Anomalies observed in the presence of $Fe_2O_3$ are explained by the formation of silicates of the type $FeO.SiO_2 + CaO.SiO_2$ or $3FeO.SiO_2 + CaO.SiO_2$. The primary reaction remains always $CaSO_4 = CaO + SO_3$. V. KALICHEVSKY

**Active oxides. LVIII. Alteration in the catalytic efficiency of an aluminum oxide**

**hydrate gel during its aging.** GUSTAV F. HÜTTIG AND JULIUS BRÜLL. *Ber.* **B65**, 1795–9(1932).—In the use of hydrated $Al_2O_3$ gels in catalyzing the conversion of MeOH to $Me_2O$, the efficiency of the catalyst was practically unchanged even after 90 days' use. This great activity is attributed to the stabilizing effect of MeOH vapor. Material dehydrated in $CH_3OH$ at high temp. appears to be more active than that aged under ordinary conditions at room temp. **LIX. Changes in the magnetic and Röntgen spectrographic properties during the transformation of a mixture of zinc oxide and ferric oxide into spinel.** HERBERT KITTEL, GUSTAV F. HÜTTIG AND Z. HERRMANN. *Z. anorg. allgem. Chem.* **210**, 26–32(1933).—Up to about 620° the $ZnO$-$Fe_2O_3$ mixt. shows little change in properties, but above this temp. the magnetic properties and x-ray spectrum approach those of the corresponding spinel, this change being complete at about 850°, at which temp. the magnetic susceptibility becomes $198.3 \times 10^{-6}$. H. S.

**Platinum catalysts.** MÁRTA TAUBER. *Magyar Chem. Folyóirat* **38**, 150–6(1932).—The catalytic activity and its connection with the voltaic potential of platinized Pt and Ni wires was examd. in the hydrogenation of $C_2H_4$. The potential was changed by formation of electrolytic H or O. The reaction velocity depends in presence of platinized Ni wires chiefly on the $p_H$ of the soln. The polarization had no definite effect Catalytic activity of platinized Pt wires is independent of $p_H$. The effect can be explained by supposing the existence of a moisture layer on the catalyst surface. With Ni wires the activity of local galvanic elements saturates the Pt surface with H and this causes the above effects. S. S. DE FINÁLY

**Energy transfer between complex gas molecules and solid surfaces.** E. W. R. STEACIE AND H. A. REEVE. *Trans. Roy. Soc. Can.* III, **26**, 75–85(1932); cf. *C. A.* **25**, 4770.—The thermal decompn. of $Et_2O$, $Me_2CO$, $Me_2O$ and propionaldehyde on heated Pt filaments was carried out to det. the effect of the catalyst on the magnitude of the activation energy of a homogeneous unimol. decompn. Calcns. based on Knudson's equation and Hinshelwood's theory and the assumption that the temp. drop occurs in an annular ring 0.5 mm. thick around the filament indicated that the reaction took place in the gas layer surrounding the filament and were not catalyzed. In the case of $Et_2O$ and $Me_2CO$ the gas layer was found to be in thermal equil. with the filament and the apparent heat of activation calcd from the temp. coeff. of the reaction agrees with that of a homogeneous reaction. The calcd. values for propionaldehyde and $Me_2O$ were much higher than those required by a homogeneous reaction. This divergence is explained on the assumption that the accommodation coeffs. for these two gases are low and hence thermal equil. with the filament was not attained by colliding gas mols. J. W. SHIPLEY

**Asymptotic expansions of the expressions for the partition function and the rotational specific heat of a rigid polyatomic molecule for high temperatures.** IRENE E. VINEY. *Proc. Cambridge Phil. Soc.* **29**, 142-8(1933).—Math. derivation by direct and repeated application of the Euler-Maclaurin summation formula. F. D. ROSSINI

**Some thermodynamic properties of the $H^1H^2$, $H^2H^2$ molecules and compounds containing the $H^2$ atom.** HAROLD C. UREY AND D. RITTENBERG. *J. Chem. Physics* **1**, 137-43(1933).—The values of the free-energy function $(F^\circ - E^\circ_0)/T$, for $H^1_2$, $H^2_2$ and $H^1H^2$ are calcd. from 20.4° to 700°K., and their dependence on the spin and statistics of $H^2$ discussed and illustrated. The equil. consts. for the reaction $H^1_2 + H^2_2 = 2H^1H^2$ are 2.3 at 100°K., 2.9 at 200°K., 3.5 at 400°K., 3.8 at 700°K., approaching, with increasing temps., the value 4, which would be expected from simple probability. The calcd. values of the equil. consts. for $H^1_2 + 2H^2Cl = H^2_2 + 2H^1Cl$ and $H^1_2 + 2H^2I = H^2_2 + 2H^1I$ differ appreciably from unity. Small differences in the electrode potentials of the two H isotopes may be expected. F. D. ROSSINI

**The heat of expansion of a gas of varying mass.** L. J. GILLESPIE AND J. R. COE, JR. *J. Chem. Physics* **1**, 103–13(1933).—The heat absorbed by expansion against the atm. of $CO_2$ and of $NH_3$ compressed in a bomb immersed in an ice calorimeter was detd. The change in internal energy of the gas with pressure was computed with a precision of ±7%. F. D. ROSSINI

**Low-temperature specific heats. III. Molecular rotation in crystalline primary normal amylammonium chloride.** J. C. SOUTHARD, R. T. MILNER AND S. B. HENDRICKS. *J. Chem. Physics* **1**, 95–102(1933).—The heat capacity of $AmNH_3Cl$ was measured from 20° to 280°K. When quenched to 90°K. a metastable form is obtained that slowly changes to an apparently stable form above 165°K. Two regions of gradual transition were found, the maxima in the $C_p$ curves occurring at the same temps., 222.0 ± 0.5 and 246.5 ± 1.0°K., for both the quenched and the annealed forms. The entropy of $AmNH_3Cl$ at 298.16°K. was computed to be 63.74 cal. deg.$^{-1}$ mol.$^{-1}$ by means of the third law, identical values, within the exptl. error, being obtained from measurements on both quenched and annealed forms. X-ray powder diffraction photographs were obtained under various conditions at 90°, 195° and 298°K. The patterns

above and below the transition regions were remarkably similar. The exptl. results are interpreted on the basis of rotation of the $AmNH_3^+$ groups in the crystals.
F. D. ROSSINI

**Heat diagram for benzene.** H. MEHLIG. *Z. tech. Physik* **14**, 86–9(1933).—An entropy chart is calcd. from reliable data. ARTHUR FLEISCHER

**Free energy of iron oxides.** JOHN CHIPMAN AND DONALD W. MURPHY. *Ind. Eng. Chem.* **25**, 319–27(1933).—Data from 39 cited references are used in deriving formulas for the calcn. of heat capacities, heats of formation, and free energies of the substances concerned in steel manuf. and the calcn. of the numerical values of these consts.
F. E. BROWN

**The free energy of formation of iodine monobromide in carbon tetrachloride solution.** DON M. YOST, THOMAS F. ANDERSON AND FOLKE SKOOG. *J. Am. Chem. Soc.* **55**, 552–5(1933).—The molal fraction of IBr in $CCl_4$ was varied from 0.00179 to 0.0224 and $N_2$ was bubbled through the solns. Analyses for total $I_2$ and for $Br_2$ were made. For $p_{IBr}$ = vapor pressures in mm. and $N_{IBr}$ = molal fraction, $p_{IBr}/N_{IBr}$ = 114. For 1/2 $I_2$ (in $CCl_4$) + 1/2 $Br_2$ (in $CCl_4$) = IBr (in $CCl_4$), $\Delta F$, at 25° = —1764 cal. The degree of dissocn. of IBr in $CCl_4$ is 9.5%. For 1/2 $I_2$ (*s*) + 1/2 $Br_2$ (l) = IBr (in $CCl_4$), $\Delta F$, at 25° = —221 cal. When distribution of IBr was made between $CCl_4$ and solns. of HBr or $HClO_4$ the ion $IBr_2^-$ formed. Its stability is roughly indicated by the equation $(IBr_2^-)/(IBr^-)(Br) = 300$.
F. E. BROWN

**Thermochemical investigation of solutions. II. Heat capacities of aqueous solutions of ethylene glycol at various temperatures.** M. B. NEUMANN AND I. A. KURLYANKIN. *J. Gen. Chem.* (U. S. S. R.) **2**, 317–21(1932); cf. *C. A.* **26**, 4748.—Heat capacities of the system $CH_2OH.CH_2OH$–$H_2O$ were investigated for glycol concns. varying between 25 and 100%, at 20.2°, 47.2° and 78.4° The results are lower than those found by other investigators by 0.7–4%. It is assumed that these results are more accurate on account of improved methods in measuring heat.
S. L. MADORSKY

**The Deacon equilibrium and the entropy of chlorine.** A. R. GORDON AND COLIN BARNES. *Trans. Roy. Soc. Can.* III, **26**, 171(1932); cf. *C. A.* **26**, 5002.—The values of $R \ln K$ for the reaction $2Cl_2 + 2H_2O = 4HCl + O_2$ were calcd. from spectroscopic data and found to agree very satisfactorily with the exptl. results over the temp. range 700–1000°. The calcd. and observed values for $R \ln K$ are —1.86 and —1.83, resp.

**A theory of electron spin.** SEISAKU SHIMASAKI. *Science Repts. Tokyo Bunrika Daigaku* **1**, 251–73(1933). E. H.

**The normal state of the helium molecule—ions $He_2^+$ and $He_2^{++}$.** LINUS PAULING. *J. Chem. Physics* **1**, 56–9(1933).—Values for nuclear charge, internuclear distances, vibrational frequency and dissocn. energy, calcd. by the variation method of treating the wave equation for the normal state of $He_2^+$, involving a 3-electron bond, agreed with exptl. values of these quantities from measurements of the spectrum of He. Such values were calcd. for $He_2^{++}$ in a similar way. L. P. HALL

**Free electrons in a crystal lattice. Wave equation and magnetic properties.** L. BRILLOUIN. *J. phys. radium* [7], **3**, 565–81(1932).—In a previous article (*J. phys. radium* [7], **3**, 373–89(1932)), B. developed the method of the "self consistent field." After correcting a slight error in his previous work, he now applies this method to the problem of the electrons in a metallic lattice. Starting with the hypothesis of free electrons, he derives an equation which agrees with one developed by Bloch in 1929, with the addn. of certain correction terms. This equation is discussed in detail and applied to various problems of paramagnetism, hysteresis, etc. The hypothesis of free electrons is far from reality and necessary modifications in the theory are indicated. The entire treatment is highly math. W. W. STIFLER

**Electrons and light quanta.** A. FLEMING. *Proc. Phys. Soc.* (London) **44**, 281–94 (1932). G. G.

**Fundamentals of geometrical electron optics.** E. BRÜCHE. *Z. tech. Physik* **14**, 49–58(1933); cf. *C. A.* **26**, 4539.—A review. A. FLEISCHER

**Diffraction of cathode rays by single crystals. III. Simultaneous reflection.** KEN'ICHI SHINOHARA. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) **20**, 40–53 (1932); cf. *C. A.* **26**, 5807.—In the electron diffraction patterns composed of black and white lines (the "P-patterns") several curved black lines were observed. These lines can be conceived as being envelopes of ordinary black lines belonging to a common zone, deviating from their straight course near the point of tangency and dying away. This phenomenon can be explained by the simultaneous reflection of cathode rays from 2 lattice planes. It was investigated by the dynamic theory of electron diffraction (given in detail in an appendix). Another pattern consisting of short black lines across dark bands, explicable on the same basis, was also observed. LOUIS WALDBAUER

**Simplified derivation of the Thomas factor.** A. SOMMERFELD. *Accad. Italia Convegno fisica nucleare* **1931**, 137–41(1932)(in German).—A derivation of the relativity precession of the axis of a moving electron, which reduces by a factor of $^1/_2$ the precession that might be expected from its interaction with a stationary nucleus. J. B. A.

**Can the shot effect of photons be observed with the eye?** R. BOWLING BARNES AND M. CZERNY. *Z. Physik* **79**, 436–49(1932).—The sensitivity of the eye is about 40–90 photons per sec. The statistical fluctuations of the photons are shown to be just perceptible for this threshold illumination. Thus the fluctuations of brightness which are found on observation of feeble sources of light may partly be due to the shot effect of photons. EGON BRETSCHER

**The occurrence of Maxwellian distribution in the Langmuir plasma.** D. GABOR. *Physik. Z.* **34**, 38–45(1933).—The Maxwellian distribution in the normal low-pressure arc can be explained by electrostatic forces between electrons in the plasma. Effects in the transition region between electron rays and the light arc can also be explained by electrostatic theory. J. B. AUSTIN

**Proposal for a uniform designation of the ionization strength in gases.** WERNER KOLHÖRSTER. *Z. Physik* **79**, 682–3(1932).—It is suggested that the ionization strength should be designated by the letter *I* followed by the abs. temp. as 1st and the pressure in mm. as 2d figure in brackets, *e. g.*, 1.85 *I* (283,755) means 1.85 ions/cc. per sec. have been measured at 10° and 755 mm. pressure. EGON BRETSCHER

**Methods of ion counting.** HEINRICH TH. GRAZIADEI. *Physik. Z.* **34**, 82–8 (1933).—A comparison of the discharge with the charge method of ion counting indicates that the latter method is not subject to the disturbing counter-field effect when used in its improved form according to Swann (cf. *C. A.* **25**, 2048), and yields results equiv. to those of the discharge method under the same exptl. conditions. The existence of the periodic fluctuation of the ion content of the air established by Sheppard (*C. A.* **26**, 2643) was not confirmed. ALLEN S. SMITH

**The relation between ionization and ionization current in gases at high pressures.**

W. R. HARPER. *Proc. Cambridge Phil. Soc.* **29**, 149–55(1933).—The phenomena that limit satn. in a high-pressure ionization chamber are discussed with particular reference to the role played by preferential recombination. MORRIS MUSKAT

**Influence of ionization on the ignition temperature of combustible gases.** BERNARD LEWIS AND C. D. KREUTZ. *J. Chem. Physics* **1**, 89–94(1933).—The ignition temps. of $CH_4$-"air" mixts. were detd. in a flow system. Both the spontaneous ignition due to temp. alone and the ignition produced by the passage of the "inert" gas (A, He, $N_2$ and $O_2$) through a condensed discharge prior to its joining the combustible gas were studied and the difference in the 2 ignition temps. was noted. In all cases the individual gases were heated to 500° before mixing in the ignition tube which was heated to any desired higher temp. The ignition temp. of mixts. was lower when pre-sparking was employed and the differences were 28° for A, 83 for He, 115 for $N_2$ and 233 for $O_2$ for an 8% $CH_4$ in "air" mixt. The material causing the ignition has a relatively long life and is removed by metal screens. Expts. lead to the conclusion that electrically charged particles are responsible for the lowered ignition temps. WILLIAM E. VAUGHAN

**Accommodation coefficients of gaseous ions at cathodes.** KARL T. COMPTON. *Proc. Nat. Acad. Sci.* **18**, 705–11(1932).—Previous work on accommodation coeffs. of gaseous ions at cathodes is discussed. Work is reported on the detn. of accommodation coeffs. of He ions on Mo as obtained by a method dependent upon the deflection of the cathode when pos. ions impinge upon it. The data agree with those obtained by thermal measurements. Conclusions: There is no rebound of the pos. particle if the mass of the impinging particle is greater than that of the surface atom. The accommodation coeff. is smallest for light ions. WILLIAM E. VAUGHAN

**Determination of the work function for oxide cathodes.** WALTER HEINZE. *Ann. Physik* **16**, 41–76(1933).—An improved method of detg. the work function for oxide cathodes by the cooling effect due to evapn. of electrons was developed. In the oxide cathodes at higher temps. the work function is greater. The metal vapor cathode (BaO layer 2.6 $\mu$) work function is 2.05 v., whereas that for the paste cathode (BaO layer 9.9 $\mu$) is 1.87 v. at 1114°K. LOUIS WALDBAUER

**Positive-ion emission from oxide catalysts.** C. F. POWELL AND LUANG BRATA. *Nature* **131**, 168–9(1933).—Very pure sources of pos. ions giving an emission of 20 microamps. per sq. cm. for many hrs. were obtained by evapg. Tl or In onto an iron oxide base. Ga gave poor results. All Tl sources give the same initial max. current which is maintained const. for large depositions. Emission increases rapidly as the temp. is raised but becomes unstable when the oxide sinters. The ions are probably distributed in a monatomic layer on the surface of the crystals throughout the source The catalytic activity of a Kunsman source for production of $NH_3$ is assumed due to alk. ions and the activity of the oxide alone to the presence of alkali as impurity. JANET E. AUSTIN

**Addendum to the publication: "Spectral light zones at the cathodes of glow discharges."** A. GÜNTHERSCHULZE AND F. KELLER. *Z. Physik* **79**, 563–5(1932).—Cf. *C. A.* **26**, 5838. E. BRETSCHER

**Start of gas discharge.** W. ROGOWSKI. *Physik. Z.* **33**, 797–808(1932).—A theory is developed for the transition of a gas from insulator to conductor when discharge commences. E. J. ROSENBAUM

**Electric currents from hot cathodes in gases and vapors at atmospheric pressure.** MARTIN RUHNKE. *Ann. Physik* **14**, 881–904(1932).—The current from a hot W cathode was measured as a function of electrode p. d., electrode sepn. and temp. of cathode. Hg vapor, H and N at atm. pressure were used. Ionization occurred in H. At high temps. and low p. d. the initial current was higher than that at the steady state. H showed little tendency to form an arc while in Hg vapor an arc could start at low p. d. E. J. ROSENBAUM

**Momentum transfer to cathode surfaces by impinging positive ions in a helium arc.** E. S. LAMAR. *Phys. Rev.* **43**, 169–76(1933). BERNARD LEWIS

**Mass-spectrograph study of the ionization and dissociation by electron impact of octane.** ERNEST G. LINDER. *J. Chem. Physics* **1**, 129–32(1933); cf. *C. A.* **26**, 5004.—When octane is bombarded by 120-v. electrons it dissocs. into small fragments to a larger extent than does $C_6H_6$. More of these fragments contain odd nos. of H atoms than contain even nos. of H atoms. E. J. ROSENBAUM

**Ionization and scattering accompanying positive ion impact in gases.** CARL A. FRISCHE. *Phys. Rev.* **43**, 160–8(1933).—The ionization produced by $K^+$ ion impact in A, Ne, He, $N_2$, CO, $H_2$ and Hg was studied for voltages ranging from 0 to 4000 v. The results check with those of previous investigators wherever comparison was possible The A curve sats. at 4000 v. The Ne curve shows a tendency to sat. at 4000 v. The ionization in He and $H_2$ was very weak. $N_2$ and CO ionize equally well and their curves fall just a little above the Ne curve. The min. potentials at which ionization sets in

vary from 100 v. for A to 1600 for $H_2$. It is shown that when the results are plotted against the kinetic energy of the impinging ion-mol. system (relative to its center of mass) the various ionization potentials show a comparatively small range. The scattering expts. show that at low voltage a few of the $K^+$ ions make direct impact in Hg and are reflected with $^4/_9$ of their original energy, which is the value expected from conservation of momentum and energy. Small-angle scattering was also observed in this case for $K^+$ and $Na^+$ in A. No ions are here observed with appreciable velocity in the reverse direction. The evidence indicates that the gases which ionize most readily are also most effective as scattering agents. It is suggested that ionizing collisions are glancing collisions. BERNARD LEWIS

**The energy interchange with corpuscular collision.** R. DÖPEL. *Ann. Physik* **16**, 1–38(1933).—The light emission from He by H-canal rays between 2 and 40 kv. was investigated. The excitation of He by protons was below the limit of observation, and could be neglected, compared to the excitation by H atoms. H-atom collisions below 2 kv. do not excite He, and hence are elastic with respect to the He; H itself is excited down to 500 v. It was shown that the excitation function H ⟶ He cannot be formulated as a general function of the energy nor as a function of the de Broglie wave length of the colliding particle. The starting point for interchange on collision must be, not the total energy of the colliding particle, but its transferable energy, $V$. The kinetic energy of the radiating electron and a part $a$ of the at. kernel ($a$ is a function of the excitation energies and of the masses of the colliding pair, which disappears for $E_1 \ll E_2$ ($E$ = excitation energy of one particle) and reaches a max. $M_1/(M_1 + M_2)$, for $E_1 \geqq E_2$. This is in qual. agreement with exptl. data. LOUIS WALDBAUER

**Collisional friction experienced by vibrating electrons in ionized air.** E. V. APPLETON AND F. W. CHAPMAN. *Proc. Phys. Soc.* (London) **44**, 246–54(1932). G. G.

**Photoeffects in semi-conductors.** B. LANGE. *Trans. Electrochem. Soc.* **63**, 13 pp. (preprint)(1933).—Two of the recent theories of photoelec. phenomena observed in semi-conductors are discussed on the basis of new expts. with different cell types, and are replaced by a theory of chem. surface activation. The explanation advanced by Schottky postulates a unidirectional film sepg. the semi-conductor and metal plate; the other theory, that of Teichmann, assumes the existence of valves detd. by the mol. structure of the crystal. Although L.'s theory of chem. activation cannot be confirmed by chem. tests because of the insignificant chem. changes involved, it is made very probable, particularly by an empirical relationship found to exist between the threshold values for the infra-red wave length and the mol. wt. of the substance in the active surface. C. G. F.

**Photoelectric currents in gases between parallel plate electrodes.** LLOYD A. YOUNG AND NORRIS E. BRADBURY. *Phys. Rev.* **43**, 34–7(1933).—The passage of photoelectrons between parallel plate electrodes through a gas has been investigated theoretically in its dependence on accelerating field strength, pressure and nature of the gas. It is found that the phys. phenomenon of importance in such an expt. is the Ramsauer scattering in the immediate vicinity of the emitter. A theoretical expression for the ratio of the observed current to satn. current is in excellent agreement with expts. on $H_2$ and $N_2$ (Bradbury, *C. A.* **26**, 4244). The theory allows the calcn. of Ramsauer cross sections of the gas from the observed currents. BERNARD LEWIS

**Photoelectric and metastable atom emission of electrons from surfaces in the rare gases.** CARL KENTY. *Phys. Rev.* **43**, 181–93(1933). BERNARD LEWIS

**The origin of the spectral selectivity of the photoelectric effect of thin films of alkali metal.** R. SUHRMANN AND A. SCHALLAMACH. *Z. Physik* **79**, 153–60(1932).—The selective photoelec. max. of K at 343 $\mu$ is obtained if a K film (> monat. size) is deposited on an absolutely gas-free surface of Ag. As an intermediate medium between the carrier metal and the photoelec. film is generally made responsible for the selective max., it is assumed that the K atoms adjoining the Ag surface are polarized and thus give rise to the selective photoelec. effect. EGON BRETSCHER

**The dependence of the electromotive force of cuprous oxide photocells [barrier-film photocells] on the illumination intensity and wave length.** ALEX. GOLDMANN AND M. LUKASIEWITSCH. *Physik. Z.* **34**, 66–73(1933).—The increase of e. m. f. $V$ of the $Cu_2O$ cell with illumination intensity $L$ established by several investigators (cf. *C. A.* **26**, 878) was analytically studied. The results of measurements at intensities in the region 200–20,000 luces are represented by the equation $V = ML/(L + MN)$, where $M$ and $N$ are consts. The relation of barrier film resistance and e. m. f. leads to the equation $R = R_0(V_1 - V)/V_1$, in which $R_0$ is the resistance at $V = 0$ and $V_1$ is an idealistic e. m. f. at $R = 0$. The limiting potentials (at $L = \infty$) are independent of the wave length of the illumination. ALLEN S. SMITH

**The dependence of the electromotive force of selenium barrier-film photocells on the illumination intensity.** A. GOLDMANN. *Physik. Z.* **34**, 74–5(1933); cf. preceding

abstr.—The equation relating e. m. f. and intensity of illumination derived for the $Cu_2O$ cell is also applicable to the Se cell. ALLEN S. SMITH

**Reversal of the current from a cuprous oxide photocell in red light.** H. H. POOLE AND W. R. G. ATKINS. *Nature* **131**, 133(1933).—A photocell (Serpidox and Auger), whose film of $Cu_2O$ was covered with Au, gave a patchy reversal when exposed to a beam of light from 6070–6270 A. U. A Siemens cell, whose $Cu_2O$ film was covered with Ag, did not give the reversal. This reversal may be explained by the penetration of the red light through the thinner parts of the $Cu_2O$ film to such an extent that the back surface effect preponderates, or it may be due to the presence of CuO, which has a reverse e. m. f. LOUIS WALDBAUER

**Magnetic spectra of secondary electrons from silver.** S. CHYLINSKI. *Phys. Rev.* **42**, 393–9(1932). BERNARD LEWIS

**The neutron and its properties [the Mackenzie Davidson Memorial Lecture].** J. CHADWICK. *Brit. J. Radiol.* **6**, 24–32(1933).—C. presents an outline of the present knowledge regarding the neutron, and theories of its structure. Expansion-chamber photographs in N and O showing at. disintegration are given, and the possible types of transmutation discussed. E. H. QUIMBY

**Heights of nuclear potential barriers.** E. C. POLLARD. *Nature* **131**, 97(1933); cf. *C. A.* **26**, 5003.—P. studied expts. on the artificial disintegration of light nuclei and the nuclear scattering of neg. particles. He briefly discusses the methods: (1) min. energy method; (2) scattering expts. A simple rule is proposed: The heights of the nuclear barriers of the light elements are proportional to the at. no. This holds for the atoms from Li to Al, the plot of height *vs.* at. no. being a straight line. WILLIAM E. VAUGHAN

**Bond energies and mass defects in atomic nuclei.** W. M. LATIMER AND W. F. LIBBY. *J. Chem. Physics* **1**, 133–6(1933).—Gamow's equation for the energy of a nucleus built up of $\alpha$-particles is modified to read: $E = \Sigma$ bond energies $-f(Z^2/R)$, in which $Z$ is the nuclear charge, $R$ is the radius and the sum is taken over all bonds between $\alpha$-particles. Mass defects of sym. nuclei calcd. on this basis give quant. agreement with exptl. values when reasonable values of 4 parameters are chosen. The calcd. value of the total energy evolved in the radioactive decompn. of U into Pb, 0.052 mass unit, agrees with the exptl. value of 0.048 unit. E. J. ROSENBAUM

**Radioactive families.** EDNA R. BISHOP. *Phys. Rev.* **43**, 38–42(1933).—Many data on isotopes of radioactive elements obtained by the magneto-optic method combined with published observations obtained by orthodox radioactive methods have been interpreted in terms of radioactive transformations shown diagrammatically in 2 tables. BERNARD LEWIS

**Disintegration of light elements by fast protons.** J. D. COCKCROFT AND E. T. S. WALTON. *Nature* **131**, 23(1933); cf. *C. A.* **26**, 5005.—By use of thinner mica windows than were previously employed (see *C. A.* **26**, 5005), particles of shorter range (6 mm. lower limit) can now be counted. On investigating Li and B, particles of shorter range were found. These appear to be $\alpha$-particles having for Li a max. range of about 2 cm. and for B about 3 cm. For B, energy considerations indicate the entry of a proton into the $B^{11}$ nucleus and the disintegration of the resulting nucleus into 3 $\alpha$-particles. WILLIAM J. KROEGER

**The diminution of nuclear radiation from beryllium in material screens.** J. THIBAUD AND F. DUPRE LA TOUR. *Compt. rend.* **195**, 655–7(1932).—In these expts. on the extinction suffered by a beam of neutrons traversing matter, account is taken of the no. and ionizing power of at. nuclei projected by the Curie-Joliot effect under the action of neutrons from Be and emanation. The ionization chamber, filled with air and lined with paraffin, is of reduced dimensions (2 cm. diam.) and gives a min. of spontaneous discharges. The shape of the extinction curves varies considerably with the exptl. arrangement. This is ascribed to diffusion. An extinction coeff. is detd. for Pb but it is difficult to interpret. Comparison of at. coeffs. obtained for screens (Sn, Fe, S, Al) contg. the same no. of atoms shows only a slight variation with at. no. W. F. MEGGERS

**Energy distribution of $\beta$-rays from atoms of known age.** B. W. SARGENT. *Trans. Roy. Soc. Can.* III, **26**, 205–16(1932); cf. *C. A.* **19**, 437, 602, 1812; **27**, 464.—The investigation was carried out to det. whether the energy distribution of $\beta$-rays is a function of the age of the emitting atoms. Th C″ atoms were chosen as the source of activity since the following product, Th D, is inactive. Five different ages were used, the least being 21 sec. and the greatest 10.7 min. The energy distributions of the $\beta$-rays were compared by taking absorption curves in paper under exactly the same conditions. These were continued until the ionization was reduced to 3% of its initial value and no differences greater than the exptl. error were found. Conclusion: Within the exptl.

errors atoms of Th C″ of different ages emit β-particles having the same energy distribution. J. W. SHIPLEY

**Scattering of β-rays. I.** B. W. SARGENT AND A. J. O'LEARY. *Trans. Roy. Soc. Can.* III, **26**, 217–32(1932); cf. *C. A.* **26**, 2647.—Expts. were carried out to det. the scattering of the β-rays of Ra E by gases and vapors. Only relative values of the scattering from a definite vol. at av. angles of 60° and 90° were obtained. The gas container was a cylindrical balloon with ebonite ends and having walls of gold-beater's skin. Different gases were passed in turn through the balloon and the intensity of the β-ray scattering was measured by the ionization observed by means of a specially designed electroscope. The scattering was observed for a no. of gaseous compds. of H, C, N, O, S, Cl, Br and I. For gaseous compds. of H, C, N and O the intensities of the scattered β-rays were found to be proportional to their mol. scattering nos. The scattering from gaseous compds. of S, Cl, Br and I relative to $CO_2$ is in some cases greater than that required by Rutherford's theory. Absorption in paper showed that the scattered β-rays were more penetrating the higher the at. no. of the scattering atoms. Since the primary rays are heterogeneous the most satisfactory explanation is that a β-ray on being scattered by a nucleus suffers a considerable loss of energy whose magnitude increases with decreasing at. no. No existing theory adequately accounts for this result. J. W. SHIPLEY

**The upper limit of energy in the β-ray spectrum of actinium B.** B. W. SARGENT. *Proc. Cambridge Phil Soc.* **29**, 156–60(1933).—By use of a thin-walled electroscope absorption curves in paper and Al were obtained for the β-rays of Act (B + C) and Act C″. These gave a range for the β-rays of Act B of 0.08 ± 0.02 g./sq. cm. The energy required for this range is 300,000 ± 50,000 v., which is the end point of the continuous spectrum. M. M.

**Mobilities of molecular aggregates in gases containing radon.** E. L. HARRINGTON AND E. O. BRAATEN. *Trans. Roy. Soc. Can.* III, **26**, 177–86(1932); cf. *C. A.* **25**, 2914.—The mobilities of mol. aggregates in gases contg. Rn were detd. by 2 different methods, *viz.*, by ultramicroscopic observation of the movement of the particles when subjected to known elec. fields and by placing exposed plates on a photographic film after a known vol. of gas had been aspirated through a tube contg. the gaseous mixt. The developed films showed the relative no. of positively and negatively charged particles and the distances traveled by them before they became attached to the plates. The 1st method gave values ranging between $1 \times 10^{-4}$ and $6 \times 10^{-4}$ cm./sec. per v./cm. while the 2d method gave $1.6 \times 10^{-2}$ to $1.4 \times 10^{-4}$ cm./sec. per v./cm. The authors conclude that this agreement cannot be taken as definite evidence that the particles were of identical nature in the 2 cases. They conclude that aggregates of radioactive atoms vary widely in their mobilities. J. W. SHIPLEY

**The electrostatic production of high voltage for nuclear investigations.** R. J. VAN DE GRAAFF, K. T. COMPTON AND L. C. VAN ATTA. *Phys. Rev.* **43**, 149–57(1933).—A generator is described for generating 10,000,000 v. electrostatically. B. L.

**A new design for a high-voltage discharge tube.** L. C. VAN ATTA, R. J. VAN DE GRAAFF AND H. A. BARTON. *Phys. Rev.* **43**, 158–9(1933).—A description is given of tests with a high-voltage tube of simple and rugged design. The tube consists essentially of a fiber cylinder extending between the electrodes and evacuated to a pressure of $4 \times 10^{-6}$ mm. Hg during operation. A potential of 400,000 v. could be maintained on a section of tube 53 cm. long. Although the voltage was limited by discharge there was no case of puncture. A method is proposed for screening the electrodes to prevent breakdown and permit application of extremely high voltages to the tube. B. L.

**Cosmic-ray ionization as a function of pressure, temperature and dimensions of the ionization chamber.** JAMES W. BROXON. *Phys. Rev.* **42**, 321–35(1932).—Expts. have been performed to test the adequacy of B.'s explanation (*C. A.* **26**, 4749) of the dependence upon pressure of the cosmic-ray ionization in gases at high pressures in terms of subsidiary radiations emitted solely from the walls of the ionization chamber. The ionization in a 436 cc. sphere of 33.32 g. mass located at the center of the 660 lb. bomb of 13.8 l. capacity used in previous expts. was found not to differ greatly from the av. ionization in the large chambers at corresponding pressures up to 175 atm. At the higher pressures γ-ray ionization and cosmic-ray ionization varied with the pressure in the same manner. These facts seem to be incompatible with the explanation mentioned above. The temp. effect amounted to 0.19% increase in ionization per centigrade degree increase in temp. at a mean pressure of 23.3 atm. and 0.27% per degree at 162.1 atm. The cosmic-ray ionization at 205 atm. in the shielded bomb agreed within about 1% with the upper limit previously observed in the same chamber with similar shielding at pressures between 130 and 170 atm. Certain transient effects assocd. with changes in pressure and temp. were observed. BERNARD LEWIS

**The ionization of oxygen and xenon by γ- and cosmic rays. Preliminary note.**

V. MASUCH. *Z. Physik* **79**, 264–5(1932).—The ionization by cosmic radiation is proportional to the d. only for the hard component of the cosmic radiation. E. B.

**Magnetic spectrum of cosmic radiation.** PAUL KUNZE. *Z. Physik* **79**, 203–5 (1932).—The magnetic deviation of cosmic rays in a Wilson's cloud chamber is used to obtain the energy spectrum of the penetrating radiation. Among 80 tracks only 59 possess a measurable curvature, 37 of the particles have pos. charges; 22 have neg. The energy-distribution curve falls monotonously as the energy increases and does not possess minima or maxima. EGON BRETSCHER

**Measurement of the range of alpha-particles from thorium with the Wilson chamber.** F. N. D. KURIE AND G. D. KNOPF. *Phys. Rev.* **43**, 311–14(1933).—The range of $\alpha$-particles from Th has been measured by the methods used by Kurie (*C. A.* **27**, 464). At 0° and 760 mm. the range is 2.72 ± 0.03 cm. The Geiger-Nuttall law is shown in the form indicated by Gamow's theory, and the latest data for the U and Th series pertaining to it are given. BERNARD LEWIS

**A procedure for the separation of gaseous mixtures of isotopes and the application to the isotopes of neon.** G. HERTZ. *Z. Physik* **79**, 108–21(1932); cf. *C. A.* **26**, 4749.—The difference of the velocity of diffusion through porous walls of the different isotopes is used to obtain a complete sepn. of $Ne^{20}$ and $Ne^{22}$. This is achieved with the help of circulating systems contg. 24 diffusion pumps. It is possible to obtain the Ne isotope in spectroscopically pure condition. EGON BRETSCHER

**Vapor pressure of hydrogen after the accumulation of the heavier isotope.** MEISSNER AND K. STEINER. *Z. Physik* **79**, 601–12(1932).—Large quantities of liqui H are evapd. either at the normal b. p. or at the triple point to accumulate the heavier isotope. The vapor pressure of the residues against that of ordinary H varies with time (temp. const.). This is due to the conversion of ortho- into para-hydrogen and not to isohydrogen which was only present in a concn. of 0.9% as shown by d. detn. This is at variance with the suggestions made by Urey, Brickwedde and Murphy (*C. A.* **26**, 1857, 4242). EGON BRETSCHER

**Lead isotopes.** EDNA R. BISHOP, MARGARET LAWRENZ AND C. B. DOLLINS. *Phys. Rev.* **43**, 43–6(1933).—Using the magneto-optic method the authors find 16 isotopes of Pb of probable mass and order of abundance, 208, 206, 207, 205, 212, 210, 204, 202, 203, 211, 201, 209, 216, 215, 214, 213. The isotopes were found in c. p. U and Th salts. 206, 210, 202, 214 predominated in U salts, while 208, 216, 204, 212 predominated in Th salts. The differential time lag varies directly with the wt. of the isotopes of a given element. The amt. of isotope present is some unknown inverse function of the concn. necessary to read its min. so that the order of appearance of the min. gives the order of abundance but not the relative abundance. The order of abundance is also given by the amt. of rotation of the analyzing Nicol necessary to extinguish their min. BERNARD LEWIS

**Bismuth isotopes.** FRED ALLISON AND EDNA R. BISHOP. *Phys. Rev.* **43**, 47 (1933).—The magneto-optic method shows that Bi has 14 isotopes having probable masses and order of abundance 211, 210, 209, 212, 215, 214, 213, 216, 207, 205, 206, 208, 219, 217. BERNARD LEWIS

**Radium isotopes.** EDNA R. BISHOP AND C. B. DOLLINS. *Phys. Rev.* **43**, 48 (1933).—The magneto-optic method shows that Ra has 4 isotopes with probable masses and in order of decreasing abundance 226, 228, 230, 232. BERNARD LEWIS

**Isotopes of uranium.** T. R. WILKINS AND W. M. RAYTON. *Nature* **130**, 475–6 (1932).—A frequency distribution curve for the no. of grains in a photographic emulsion in the track of $\alpha$-rays from U shows 4 distinct maxima. These are thought to be due to U I, U II, protoactinium and radioactinium. A study of the relative abundance of $\alpha$-rays from the two series using U of different geologic ages is expected to lead to a method of detg. the ages of rocks which is free from the errors inherent in the U/Pb ratio method. From the recent rock samples (max. of $7 \times 10^8$ yr.) the U and actinium isotopes seem to be about equally active. HOWARD AGNEW SMITH

**The isotopes of uranium, thorium and thallium.** ROY GOSLIN AND FRED ALLISON. *Phys. Rev.* **43**, 49–50(1933).—The magneto-optic method shows 8 isotopes each for U, Th and Tl. BERNARD LEWIS

**Isotopes of uranium, thorium and lead and their geophysical significance.** CHAS. S. PIGGOT. *Phys. Rev.* **43**, 51–9(1933).—In an effort to improve the data required in the calcn. of geologic age, a detn. of the isotopes of the elements involved in the radioactive disintegrations (at Nos. 81–92) was made by the magneto-optic technic of Allison. There appear to be 4 radioactive series beginning with 8 isotopes of U (2 to each), and ending with 16 isotopes of Pb (4 to each). The relation of the constituent isotopes of U to those of Pb in a mineral are complex, and vary somewhat from mineral to mineral. Ordinary Pb and radio-derived Pb possess different isotopic compns. although both apparently derive from the same ultimate source. The isotopic compn

of Pb changes with its age. The most accurate age detn. would be obtained by confining the calcn. to the $U^{238}$ and $Pb^{206}$ isotopes, resp. BERNARD LEWIS

**The measurement of atmospheric radioactivity by the flow method.** G. ALIVERTI. *Nuovo cimento* **9**, 313–27(1932).—Atm. radioactivity was measured at Turin from Feb. to July, 1932 by a flow method (*C. A.* **26**, 2647). The mean activity corresponds to $220 \times 10^{-18}$ curies of Rn per cc. J. B. AUSTIN

**Measurement of radium in minerals of low uranium content by the γ-ray procedure.** F. BEHOUNEK. *Z. Physik* **79**, 583–94(1932).—A method is developed as a substitute for chem. analysis of the by-products of Ra manuf. The γ-radiation of the residual material of the pitchblende is detd. with a specially designed ionization chamber connected to an electrometer and a source of potential. A calibration of the app. with Ra permits detn. of the amt. of Ra and from this of $U_3O_8$ in the material, which is supposed to be in radioactive equil. Correct results are obtained only if the inner absorption of the γ-radiation of the sample is taken into account. The whole instrument is meant to be used in series measurements in factories. EGON BRETSCHER

**Radioactivity of the waters of the Ballon d'Alsace.** R. DELABY, R. CHARONNAT AND M. JANOT. *Compt. rend.* **195**, 1294–7(1932). ODEN E. SHEPPARD

**Radioactive mineral investigations with the Geiger-Müller tube counter.** W. VOGT. *Physik. Z.* **34**, 79–82(1933).—A method, having the advantage of great simplicity, is described for investigating the radioactivity of minerals with the aid of the Geiger-Müller tube counter. The av. error in a series of measurements was $2.5 \times 10^{-13}$ g. Ra/g. of mineral. ALLEN S. SMITH

**The analysis of primary radioactive minerals.** ADRIEN KARL. *Compt. rend.* **195**, 1071–2(1932).—Many of the primary radioactive minerals, especially the columbates of U and rare earths, are attacked by $COCl_2$ at 500–50°. To det. whether this method could be used for a quant. method various synthetic mixts. were moistened with concd. $BaCl_2$ soln., dried and heated $1^1/_2$ to 2 hrs. in a silica boat in a combustion tube in a stream of dry $COCl_2$ to 550°. It was found that the volatile chlorides of Cb, Ta, Ti, U, Fe and Al collected quantitatively in the cold attached U tube contg. dil. HCl and the nonvolatile chlorides of the rare earths, alkali metals and other common metals and Zr and Th together with silica remained quantitatively in the boat. This method gave more const. results than the alkali bisulfate fusion method with samples of euxenite, betafite, samarskite from Madagascar and pitchblende from Mexico. O. E. S.

**The relative intensities of the $L\alpha_1$, $\beta_1$, $\beta_2$ and $\gamma_1$ lines in tantalum, tungsten, iridium and platinum.** VICTOR J. ANDREW. *Phys. Rev.* **42**, 591–608(1932).—Based on $\alpha_1$ 100, $\beta_1$, $\beta_2$ and $\gamma_1$ are, resp., for Ta 49.5, 18.8, 9.0; W 49.4, 20.2, 10.0; Ir 48.0, 21.2, 10.2; Pt 46.1, 21.0, 9.7. BERNARD LEWIS

**The fine structure of the $K_\alpha$ line of carbon.** MAX MORAND AND A. HAUTOT. *Compt. rend.* **195**, 1070–1(1932).—Examd. with a tangent grating spectrograph to the 5th order, the $K_\alpha$ line of C appears to be complex. There are at least 2 components, sepd. about 0.6 A. U. The component of greater wave length is the stronger; the weaker one is due to ionized atoms. W. F. MEGGERS

**Absorption curves and spectra of x-ray beams.** A. MUTSCHELLER. *Radiology* **20**, 32–46(1933).—Pulsating high-voltage current gives practically straight semi-logarithmic absorption curves. Uniform potential current gives bent semi-logarithmic absorption curves. The reasons for the variation seems to lie in the different spectral distributions of wave-length intensities in the 2 cases. Pulsating current produces greater relative intensities in the characteristic line area compared with the intensity of the radiation on the short-wave side of the characteristic lines than does uniform-voltage current. The intensity max. of a short wave-length portion produced by uniform voltage changes on the wave-length scale with increased filter thickness, while there is no such change for pulsating-voltage current. The so-called "average wave length" of an x-ray beam has a direct meaning when applied to radiation quality or depth actions only if the semi-logarithmic absorption curve is a straight line. GEORGE L. CLARK

**X-ray diffraction in ethyl ether near the critical point.** F. H. WALDEMAR NOLL. *Phys. Rev.* **42**, 336–9(1932).—X-ray diffraction ionization curves were obtained for $Et_2O$ at 43.5 ± 0.7 kg./sq. cm. pressure with temps. in the range 25° to 210°. The crit. pressure and temp. of ether are 36.7 ± 0.2 kg./sq. cm. and 194.6 ± 0.3°, resp. In the region of higher temps. the ionization curves are a combination of the liquid and polyat. gas types, falling rapidly at 0° with increasing angle, then rising to a distinct peak and again falling. Liquid semi-orderly "cybotactic" groups are in evidence from room temp. to 199° but not for sp. vols. greater than the crit. sp. vol. These groups may be expected to vanish at the crit. point. The influence of the polyat. gas type begins to appear at the low temps. and increases with temp. The liquid type decreases

almost linearly to 155°, where it begins to fall off very rapidly. The observations are in excellent accord with the "cybotactic" view of the interior of a liquid. B. L.

**The measurement of x-ray absorption coefficients by the use of the FP-54 Pliotron.** L. M. Heil and J. E. Edwards. *Phys. Rev.* **43**, 1–4(1933). Bernard Lewis

**Calculations of the corrections for Röntgen spectrometers.** H. Seemann. *Z. Physik* **79**, 661–7(1932). Egon Bretscher

**Application of the Blair-Leighton equation to x-rays.** J. A. Lester and Julian M. Blair. *J. Phys. Chem.* **37**, 17–20(1933).—The Blair-Leighton equation (*C. A.* **26**, 4762) for the time rate of growth of the latent photographic image may also be applied to the rate of the latent image made by x-rays. Another form of the integrated equation is given. I. J. Patton

**Operation of thick-walled x-ray tubes on rectified potentials.** Lauriston S. Taylor and C. F. Stoneburner. *Bur. Standards J. Research* **10**, 233–47(1933). E. H.

**A new and much more rapid intensifying screen allowing great alterations in radiographic technic.** Leonard Levy and Donald West. *Brit. J. Radiol.* **6**, 85–102 (1933).—A new fluorescent form of ZnS crystals has been produced which has several advantages over the $CaWO_4$ usually used in x-ray intensifying screens. The fluorescent light is more brilliant, more concd. in the actinic region, and there is less after-glow of a quality which might affect the film. The absorption of x-rays in the front screen is markedly less than in the materials commonly used. These factors make possible considerably shorter exposures in the taking of radiographs. E. H. Quimby

**The structure of interference lines obtained by the powder method.** I. Levin and Emil Ott. *Z. Krist.* **84**, 166–9(1933).—Powder photographs of quartz, high-temp. cristobalite and NaCl, with samples of about 0.5–1.0 mm. diam., show a doubling of lines with small glancing angle. This is due to the absorption of x-ray at the center of the sample. The effect is limited to certain ranges of absorptive power. The predictions of Möller and Reis (*C. A.* **23**, 4883) are thus confirmed. L. S. Ramsdell

**Precise estimation of lattice constants by means of the powder methods.** G. Menzer. *Fortschr. Mineral. Krist. Petrog.* **16**, 162–207(1932).—A review of the various powder method modifications, emphasizing the sources of, corrections for, and limits of error of each. Comprehensive bibliography. John Earl Milbery

**X-ray investigation of the change in orientation of the crystal lattice with change in modification.** Hikoroku Shôji. *Z. Krist.* **84**, 74–84(1933).—Laue photographs show that the structural changes occurring in the transitions of Fe, ZnS and $CaCO_3$ agree with the theory previously advanced (*C. A.* **25**, 5810). The (111) planes of sphalerite become the (0001) of wurtzite, with a single crystal becoming a coarsely cryst. aggregate. The (001) of aragonite becomes the (111) of calcite, with a single crystal forming a finely cryst. aggregate. A camera for high-temp. Laue photographs is described. L. S. Ramsdell

***p*-Bromochlorobenzene and its congeners: various equivalent points in molecular lattices.** Sterling B. Hendricks. *Z. Krist.* **84**, 85–96(in English)(1933).—An examn. of the crystal structure of *p*-bromochlorobenzene indicates that the halogen atoms occupy the same set of equiv. positions—these being the general positions of space group $P2_1a$ — ($C_{2h}^5$). Although the *p*-dibromo- and *p*-dichlorobenzenes are apparently isomorphous, they differ markedly in their optic orientation, and probably in their mol. orientation. L. S. Ramsdell

**The dispersion and absorption of helium.** J. P. Vinti. *Phys. Rev.* **42**, 632–40 (1932). Bernard Lewis

**Radiation from slow electrons.** Leo Nedelsky. *Phys. Rev.* **42**, 641–65(1932).—Expressions are developed describing radiation emitted by an electron in the field of a neutral atom; a point charge $Ze$ surrounded by a spherical shell of radius $a$ carrying a charge $-Ze$ is used as a model for the latter. Bernard Lewis

**The width of spectral lines in gases.** Viktor Weisskopf. *Physik. Z.* **34**, 1–24 (1933).—A review of the factors influencing the width of a line. J. B. Austin

**The lifetime of the metastable $^3P_2$ neon atom.** E. Matuyama. *Phys. Rev.* 42, 373–8(1932).—By use of the rotating-disk method the percentage absorption of the line $^3P_2$ — $^3D_3$ at various stages after the interruption of excitation of the gas Ne in the absorption tube was measured. At a pressure of 5.2 mm. Hg, the life of the $^3P_2$ state was found to be about 0.005 sec. The effects of impurities and temp. were also investigated. Bernard Lewis

**The effect of foreign gases upon the relative intensities of the mercury triplet $2^3P_{012}$—$2^3S_1$ under conditions of optical excitation.** R. T. Macdonald and G. K. Rollefson. *Phys. Rev.* **43**, 177–80(1933).—Unexcited Hg atoms are raised to the $2^3S_1$ state by "stepwise" optical excitation. They may leave this level upon emission of radiation by 4 paths—the 1st to the $2^1P_1$ state, a transition of relatively low probability, and

the other 3 to the $2^3P_2$, $2^3P_1$, and $2^3P_0$ states with the emission of 5461, 4358 and 4046 A. U., resp. The mean life of the $2^3S_1$ state, measured by independent methods, yielded values, when measured by the line 5461 A. U., equal to approx. 4 times those obtained from either 4358 or 4046 A. U. The addn. of foreign gases should cause a decrease in the intensity ratio with increasing pressure of 5461 A. U. to either 4358 or 4046 A. U., while that of 4046 to 4358 A. U. should remain const. However, these ratios were all found to be invariant with pressure, up to 400 mm. with $N_2$ and up to 100 mm. with the $N_2$-$CO_2$ mixts. BERNARD LEWIS

**Absorption of light in cesium vapor.** H. J. J. BRADDICK AND R. W. DITCHBURN. *Nature* **131**, 132–3(1933).—The absorption of light by Cs vapor was measured by photographic photometry from the series limit (3184 A. U.) to 1935 A. U. A 2-m. quartz tube was used as the cell, and the vapor heated to 270°, and the pressure varied from 0.15 to 0.6 mm. The absorption at any one wave length appears to be directly proportional to the pressure. The total absorption at 3130 A. U. is 1.92 ($\pm$0.1) $\times 10^{-19}$ cm.$^{-1}$, which indicates photoelec. absorption. The increase in absorption in far ultraviolet may be an at. phenomenon. LOUIS WALDBAUER

**Spectrum of the corona discharge in air, oxygen and nitrogen.** A. C. YOUNG AND A. G. CREELMAN. *Trans. Roy. Soc. Can.* III, **26**, 39–42(1932).—The spectrum of the corona discharge in air, $O_2$ and $N_2$ was examd. and found to be of mol. origin. No at. spectrum was observed. The observations are in partial agreement with those of Oyama but quite opposed to those of Zebrowski, who observed spark lines in the corona discharge in air. J. W. SHIPLEY

**Further description and analysis of the first spectrum of xenon.** C. J. HUMPHREYS AND W. F. MEGGERS. *Bur. Standards J. Research* **10**, 139–49(1933).—A preliminary description and analysis of this spectrum (*C. A.* **26**, 29) is now replaced by a more complete and accurate one. The data consist of estd. intensities, wave lengths and spectral term combinations for 538 lines ranging from 3340.04 to 11140.90 A. U. The no. of lines measured with the Fabry-Perot interferometer was increased from 45 to 130. A new term table embodies a slight change in the abs. term values as well as many new terms. Some rearrangement of the *d*-terms resulted from the elimination of uncertainties in the assignment of *j*-values, and a new *f*-type sequence was found. W. F. MEGGERS

**The spectra of the calcium I-like ions: manganese VI, iron VII, cobalt VIII and nickel IX.** WILLOUGHBY M. CADY. *Phys. Rev.* **43**, 322–8(1933).—The spectra of 4 new ions have been added to the sequence of spectra isoelectronic with Ca I. B. L.

**Investigation in the infra-red absorption spectrum of the change of the solvent by the dissolved substance. I. The influence of dissolved salts on the state of association of the solvent water.** R. SUHRMANN AND F. BREYER. *Z. physik. Chem.* **B20**, 17–53 (1933); cf. *C. A.* **26**, 30.—The infra-red absorption spectrum of aq. soln. of various salts was investigated. One group of salts, of which the alkali halides are typical examples, produces a depolymerization effect and makes the bands steeper with a displacement. The influence of both cation and anion was investigated. Increasing ionic radius causes an increase in the effect. An effect due to hydration is superimposed on the depolymerization effect and shifts the bands in the opposite direction. The influence of different ions and their radii and valences was also investigated for this effect. A second group of salts of which $MgCl_2$ is typical produces effects that are of a chem. nature. G. M. MURPHY

**Interferometer measurements in the extreme ultra-violet region of copper.** J. C. MCLENNAN AND F. M. QUINLAN. *Trans. Roy. Soc. Can.* III, **26**, 19–24(1932).—Lines in the ultra-violet spectrum of Cu were examd. by means of the interferometer for detg. their desirability as secondary standards of wave length. The results for 13 lines are given and since these agree very closely (less than 1 unit in the 2nd decimal place) with the results of other observers it is suggested that the wave lengths of lines in the ultra-violet spectrum of Cu be accepted as standards. J. W. SHIPLEY

**Spectra of bromine—Br V, VII and IV.** A. S. RAO AND K. R. RAO. *Nature* **131**, 170(1933).—The chief multiplets of higher spark spectra were detd. from photographs taken under different conditions of excitation. The characteristic intervals of the deepest $^3P$ terms are: Br V, 6090 cm.$^{-1}$; Br VII, 7580 cm.$^{-1}$. For Br V, $4p^3P_0 - 4p^3P_1$ and $4p^3P_1 - 4p^3P_2$ are 2115 and 4906 cm.$^{-1}$. For Br IV the intervals of $5s^3P_{0,1,2}$ are 1281 and 4688. This does not agree with the results of Deb (cf. *C. A.* **24**, 3433), which R. thinks out of step with the isoelectronic sequence Ge I to Br IV. JANET E. AUSTIN

**The arc spectrum of iodine.** S. C. DEB. *Proc. Roy. Soc.* (London) **A139**, 380–97 (1933).—Nearly 450 lines in the arc spectrum of I have been measured between 3200 and 9113 A. U. Of these 160 have been classified as combinations between doublet and quartet terms resulting from the electron transitions $5p - 6s$, $6s - np$ and $6p - ns$.

The value of the deepest term is $^2P_{3/2} = 85{,}439\ \text{cm.}^{-1}$, from which an ionization potential of 10.548 v. is derived. The analysis here given is not in agreement with that of Evans (*C. A.* **26**, 29). C. C. KIESS

**Term values in the arc spectrum of selenium.** R. C. GIBBS AND J. E. RUEDY. *Phys. Rev.* **40**, 204–6(1932).—See *C. A.* **26**, 3441. G. G.

**The Stark effect for xenon.** H. W. HARKNESS AND J. F. HEARD. *Proc. Roy. Soc.* (London) **A139**, 416–35(1933); cf. *C. A.* **26**, 3441.—Stark effects have been measured for 98 Xe lines between 3500 and 8400 A. U., the discharge tube being of the modified Lo Surdo type with field strengths of 67,000 v./cm. In general, the sharp, principal and fundamental series lines are displaced without splitting, while many of the diffuse series lines exhibit large displacements and splitting into a variety of patterns. These displacements are attributable to the displacements of the initial energy states of the lines by the elec. field and in sign and magnitude they are qualitatively accounted for by Pauli's formula. C. C. KIESS

**Atomic energy levels and Zeeman effect.** D. R. INGLIS AND N. GINSBURG. *Phys. Rev.* **43**, 194–61(1933).—The present theory of complex spectra, in which magnetic interactions between electrons are neglected, has been successful enough in interpreting the data for certain simple configurations. The extent to which this procedure can be applied to the energy levels and Zeeman effect of other configurations is discussed. Theory is extended to include $p^5p$ and comparison is made with exptl. data. Greater discrepancies appear here than in the simpler cases. This is an example of the greater importance of the neglected interactions in more complex configurations. B. L.

**Zeeman effect in solids.** F. H. SPEDDING. *J. Chem. Physics* **1**, 144–54(1933); cf. *C. A.* **26**, 1187.—Photographs and microphotometer curves are given for absorption spectra of $GdCl_3 \cdot 6H_2O$ at various temps. in magnetic fields in the range 0–22,500 gausses. Many of the lines split up in the magnetic field into 9 components. This behavior can be explained by the assumption that excited states arise from a $4f^6 5x$ configuration. The external magnetic field cannot orient the orbit of a $5x$ electron but only its spin. In crossed elec. and magnetic fields the selection rules break down and 9 lines are possible. Other factors in the splitting are the Paschen-Back effect, coupling of spin to orbit, and presence of more than 1 type of Gd ion. E. J. ROSENBAUM

**The isotope displacement in hyperfine structure.** G. BREIT. *Phys. Rev.* **42**, 348–54(1932).—With Goudsmit's extension of Lande's formula for $(1/r^3)$, it is possible to explain the order of magnitude of the isotope displacements in Hg, Tl, Pb arc and spark spectra on the hypothesis of small changes in nuclear radii. The nuclear radius is supposed to be proportional to the $^1/_3$ power of the at. wt. The effective nuclear charge is supposed to be distributed with a roughly uniform density through the interior of the nucleus. The spectra Hg I, Hg II, Tl I, Tl II, Pb II are in agreement with the above theory. BERNARD LEWIS

**Line groups and fine structure.** F. PASCHEN. *Sitzber. preuss. Akad. Wiss Physik.-Math. Klasse*, **1932**, 502–13.—Spectrum lines belonging to multiplets with small term-sepns. and exhibiting hyperfine structure sepns. equal to, or greater than, the multiplet sepns. are affected by the nuclear moment in the same manner as by a strong external magnetic field. Not only does the multiplet group have its lines displaced analogously to the Zeeman components in the Paschen-Back effect with accompanying changes in the intensities, but there appear also the lines usually forbidden by the selection rule for inner quantum nos. These features are all illustrated by examples selected from the spectra Al II and Hg I. C. C. KIESS

**Precision determination of the magnetic moments of potassium and lithium with regard to their nuclear magnetic moments. I.** W. MEISSNER AND H. SCHEFFERS. *Physik. Z.* **34**, 48–53(1933).—An app. for the precise detn. of at. moments is described. The magnetic moment is $0.916 \times 10^{-20}$ gauss cm. $\pm 0.5\%$ for both K and Li. The heat of dissocn. of Li is within 5% of the value given by Lewis (23,400 cal., cf. *C. A.* **25**, 5073). J. B. AUSTIN

**The hyperfine structure of the arc lines and the nuclear moment of copper.** RUDOLF RITSCHL. *Z. Physik* **79**, 1–25(1932).—$Cu^{63}$ and $Cu^{65}$ both possess a nuclear spin of 3/2. EGON BRETSCHER

**The hyperfine structure of mercury lines.** T. S. SUBBARAYA. *Current Sci.* **1**, 99–100(1932).—On the basis of a recent paper (cf. *C. A.* **26**, 4752), S. gives a term scheme more in accord with the structure of 5026 A. U. ($6^1P_1 - 8^1S_1$), recently given by Venkatesachar and Sibaiya (cf. *C. A.* **26**, 1512) and of 3131.84 A. U. ($6^3P_1 - 6^1D_2$) given by Nagaoka, than the one proposed by Schüler and Jones (cf. *C. A.* **26**, 3181, 5838). WILLIAM J. KROEGER

**Nuclear spin moment of the thallium atom.** A. L. NARAYAN AND A. S. RAO. *Current Sci.* **1**, 75–6(1932); cf. *C. A.* **25**, 4787; **26**, 373.—The hyperfine structure of the line 3776 A. U. ($6^2P_{1/2} - 7^2S_{1/2}$) was found to show more components than those

observed by Schüler and Keyston (see *C. A.* **25**, 4787). This structure (consisting of components at $d\lambda$ = +0.064, +0.057, +0.010, 0.000, —0.053, —0.093, —0.101) is explained except for the component at —0.053 by assigning a nuclear spin to each isotope together with an isotope displacement of the $^2P_{1/2}$ term of about 0.050. These observations and those previously reported (cf. *C. A.* **26**, 373) confirm the isotope displacement effect in the hyperfine spectrum of the Tl I line. W. J. K.

**Hyperfine structure of the spark spectrum of antimony and nuclear moments of the antimony isotopes.** J. S. Badami. *Z. Physik* **79**, 206–23(1932).—See *C. A.* **27**, 661. Egon Bretscher

**Hyperfine structure of the arc spectrum of antimony [Sb I].** J. S. Badami. *Z. Physik* **79**, 224–30(1932). Egon Bretscher

**The quantum mechanics of beryllium hydride.** Clarence E. Ireland. *Phys. Rev.* **43**, 329–36(1933).—The interaction of a normal H atom with a Be atom having the electronic configurations $2s2s$ and $2s2p$, resp., has been studied by the application of a modified Heitler-London method. Bernard Lewis

**Absorption spectrum of iodine bromide.** Weldon G. Brown. *Phys. Rev.* **42**, 355–63(1932).— It is shown by means of a vibrational analysis that the absorption spectrum of IBr is analogous to that of ICl and that an interpretation similar to that proposed by Brown and Gibson (*C. A.* **26**, 3727) for ICl is applicable. The infra-red bands of IBr discovered by Badger and Yost (*C. A.* **25**, 3790) are classified as a $^3\Pi_1 \leftarrow\!\!- {}^1\Sigma$ transition. The $^3\Pi_1 \leftarrow\!\!- {}^1\Sigma$ system is observed as a faint set of bands in the red, not hitherto reported, which exhibit the same type of predissocn. as the corresponding bands of ICl. Transitions to a state which originates at the max. of the $^3\Pi_{0+}$ state and which dissocs. to yield normal I and excited Br atoms are observed as a strong system of partially diffuse bands. The vibrational quantum numbering for each system is deduced from measurements of the isotope effect due to Br. The heat of dissocn. of IBr is 1.808 ± 0.001 v. For the 4 mols. $I_2$, IBr, ICl and $Br_2$ it is shown that the sepn. of the $^3\Pi_{0+}$ and $^3\Pi_1$ states is roughly equal to 2/3 of the mean $^2P$ multiplet widths of the constituent atoms. The total $^3\Pi$ widths are then probably greater and the $^3\Pi_2$ state is somewhat lower than has been supposed. Bernard Lewis

**Magnetic rotatory power of chlorine and of hydrochloric acid gas.** R. de Mallemann and P. Gabiano. *Compt. rend.* **196**, 106–7(1933).—The magnetic rotatory power of $Cl_2$ was measured at 8.5° for the yellow and green Hg lines at pressures of 998 and 250 mm. Both series of observations give as the at. rotation $10.4 \times 10^{-5}$ radians, while the value previously deduced from measurements on the vapors of $CH_3Cl$, $C_2H_5Cl$, $CHCl_3$ and $CCl_4$ is $9.0–9.5 \times 10^{-5}$ radians. This increase of about 10% is ascribed to the union of the 2 atoms in the $Cl_2$ mol. Similar observations on HCl gas at 1120 mm. and 8.5° gave $13.1 \times 10^{-5}$ radians as the mol. rotation. The value deduced by adding the at. rotations is $12.4 \times 10^{-5}$. The increase is again ascribed to the union of the 2 atoms. W. W. Stifler

**The extinction of iodine fluorescence by magnetic fields and by the addition of foreign gases.** Wolfgang Berg. *Z. Physik* **79**, 89–107(1932).—The influence of I pressure, a foreign gas or a magnetic field on the intensity of fluorescence does not follow the relation given by Stern and Volmer. Egon Bretscher

**Photometric investigation of the strongest emission bands of fluorine.** Jonatan Aars. *Z. Physik* **79**, 122–38(1932).—The results of Gale and Monk (*C. A.* **23**, 3162) are confirmed and strong perturbations of the frequencies and intensities observed. The intensity ratios of the weak bands to the strong exceeds the value 3 of G. and M., thus leaving the value of the nuclear spin of the F atom still doubtful. E. B.

**Barium hydride band spectra in the near infra-red.** Wm. W. Watson. *Phys. Rev.* **43**, 9–11(1933).—A BaH band system with principal heads at 8924 and 9017 A. U. degraded to the red is $^2\Sigma \longrightarrow {}^2\Sigma$ with the same lower $^2\Sigma$ as for the $^2\Pi \longrightarrow {}^2\Sigma$ BaH bands in the visible red region. For the upper $^2\Sigma$ state $B_0 = 3.232$, $D_0 = -1.323 \times 10^{-4}$ and $\gamma_0 = -4.84$. This very large spin doubling indicates interaction with a near-lying lower $^2\Pi$ state which computation shows to be the probable upper state of another BaH band observed on the long wave-length side of 10,052 A. U. The nature of the electron configurations in the several BaH states is discussed. Bernard Lewis

**The band spectra of MgO, CaO and SrO.** P. C. Mahanti. *Phys. Rev.* **42**, 609–21 (1932).—New measurements of the wave lengths of the band heads attributed to the oxides of Mg, Ca and Sr have been made from moderate dispersion spectrograms. The bands have been classified into 2 systems. Equations of the band heads in terms of half-quantum nos. are given for MgO (red bands), MgO (green bands), CaO (blue bands), CaO (ultra-violet bands), SrO (blue bands) and SrO (ultra-violet bands). Bernard Lewis

**A system of bands of CaO in the near infra-red.** P. H. Brodersen. *Z. Physik* **79**, 613–25(1932).—A new spectrum is observed when $O_2$ is admitted to a Ca arc. It is

shown to be due to CaO. From the rotation lines the moment of inertia I is found to be $62.3 \times 10^{-40}$ for the higher and $37.2 \times 10^{-40}$ for the lower levels. The nuclear distances are $1.82 \times 10^{-8}$ cm. and $1.74 \times 10^{-8}$ cm., resp. The electron terms are both $^1\Sigma$. E. B.

**The structure of the third positive group of CO bands.** G. H. Dieke and J. W. Mauchly. *Phys. Rev.* **43**, 12–30(1933).—The 3rd pos. group of CO was photographed under high dispersion. The bands are $^1\Sigma \longrightarrow {}^1\Pi$ transitions. The $^1\Sigma$ state shows many strong perturbations. The triplet sepn. is very small. Of the 15 branches which must be expected under these conditions, 14 are found and traces of the 15th. Nine of these branches are strong and can be traced to $K = 55$. The others are weak and are present only for small values of the rotational quantum no. $K$. The 5 edges which are charactertistic for the bands of the 3rd pos. group are formed by the two $O$-branches and the 3 $P$-branches. The character of the Λ-doubling and the no. of missing lines near the origin shows that the $^1\Pi$ state is a normal $^1\Pi$ state. The values of the rotational consts. are $B' = 1.89$ for the initial and $B'' = 1.686$ cm.$^{-1}$ for the final state; from these it follows that the values for the moment of inertia are $F' = 14.7 \times 10^{-40}$ and $F'' = 14.43 \times 10^{-40}$. Complete details are given for the $0 \longrightarrow 0$ (2833), $0 \longrightarrow 1$ (2977), $0 \longrightarrow 2$ (3134) and $0 \longrightarrow 3$ (3305) bands. Bernard Lewis

**The continuous absorption of oxygen between 1750 and 1300 A. U. and its bearing upon the dispersion.** R. Ladenburg and C. C. Van Voorhis. *Phys. Rev.* **43**, 315–21 (1933).—The continuous absorption of $O_2$ between 1750 and 1300 A. U. has been investigated with a small fluorite spectrograph by the photographic-photometric method. The absorption coeff. $\alpha$ plotted as a function of the wave no. $\nu$ has a relatively sharp max. at $6.8 \times 10^4$ cm.$^{-1}$ ($\lambda = 1450$ A. U.) and falls off symmetrically on both sides. The max. absorption coeff. reduced to N. P. T. is about 490 cm.$^{-1}$ By integration of the absorption curve the $f$-value turns out to be 0.193 compared with 0.202 calcd. from dispersion measurements. The corresponding resonance wave length from the dispersion measurements is 1468 A. U., in fairly good agreement with the observed position of the max. of absorption. A dispersion formula which takes into account the distribution of absorption in a continuous band is given, and is applied to the dispersion of $O_2$. Bernard Lewis

**The absorption spectra of highly compressed oxygen and the existence of $O_4$ molecules. I. The ultra-violet bands between 2900 and 2300 A. U.** W. Finkelnburg and W. Steiner. *Z. Physik* **79**, 69–88(1932).—Highly compressed $O_2$ possesses diffuse triplet bands in the region 2300–2900 A. U. which are not observed at ordinary pressure. Since their intensity increases quadratically with pressure they are most probably due to $O_4$ mols. or emitted at the moment of a collision of 2 $O_2$ mols. The convergence of this band system coincides with that of $O_2$ in the ground state. Egon Bretscher

**Interpretation of the rotational structure of the $CO_2$ emission bands.** Robert S. Mulliken. *Phys. Rev.* **42**, 364–72(1932).—Conclusion: The mol. $CO_2$ in equil. is nearly linear, or probably strictly linear, in both initial and final states. B. L.

**The absorption spectra of some higher oxides.** Arun K. Dutta and Prabhat K. Sen Gupta. *Proc. Roy. Soc.* (London) **A139**, 397–405(1933).—The absorption spectra of the oxides $N_2O_5$, $TeO_2$ and $MoO_2$ have been photographed and found to consist of 2 regions of continuous absorption sepd. by a band of transmitted radiation. The 1st band, in each case, has been interpreted as resulting from the sepn. of an O atom in the $^3P$ state from the mol., and the 2nd band as resulting from the sepn. of an O atom in the metastable $^1D_2$ state. From the absorption of $N_2O_5$ the heat of dissocn of $O_2$ is detd. as 128 kg.-cal. C. C. Kiess

**The symmetry of molecules and scattered spectra.** Jean Cabannes. *Ann. phys.* **18**, 285–328(1932).—A theory of the polarization of Raman lines is derived from the postulate of optical anisotropy in polyatomic mols. Selection rules are deduced and used to correlate mol. structure with observed oscillations. Oscillations in the mol. are classed as symmetric, anti-symmetric and degenerate according to their relation to the elements of symmetry. Oscillations which do not conserve all the elements of symmetry present at rest correspond to unpolarized or forbidden lines. J. B. A

**Chemical aspects of the infra-red absorption spectra of the ethyl halides.** Paul C. Cross and Farrington Daniels. *J. Chem. Physics* **1**, 48–55(1933).—The absorption spectra of EtCl, EtBr and EtI are given for the region 1.5 to 15 $\mu$. Eight fundamental frequencies, their 1st harmonics and simple combinations account for the entire spectrum of each compd. Types of vibrations connected with each fundamental are suggested and used to explain the decompn. of EtBr. J. E. A.

**The envelopes of infra-red absorption bands.** Sherman L. Gerhard and David M. Dennison. *Phys. Rev.* **43**, 197–204(1933).—The intensity formulas for the fine-structure absorption lines of mols. of the sym. rotator type are approximated. The expressions are evaluated explicitly and may be used either to det. the intensity of an

individual line or the envelope of all the fine-structure lines. The results are applied to the infra-red bands of methyl halides. The values obtained for the moment of inertia, $A$, perpendicular to the symmetry axis are 32, 61, 89, 99 $\times 10^{-40}$ for MeF, MeCl, MeBr and MeI, resp. The distances between the C and the halogen nuclei are computed. They agree satisfactorily with the corresponding distances deduced by Pauling (*C. A.* **26**, 3177). BERNARD LEWIS

**Infra-red absorption spectra of aliphatic and aromatic hydrocarbons.** P. LAMBERT AND J. LECOMTE. *Ann. phys.* **18**, 329–90(1932).—The spectra of the following compds. have been measured between 6 and 16 $\mu$ with a registering spectrograph: hexane, isohexane, 2,3-dimethylbutane, $Me_3CEt$, octane, nonane, decane, undecane, duodecane, tetradecane, octadecane, 2,7-dimethyloctane, 1-octene, 1-nonene, 1-decene, 1-duodecene, 1-tetradecene, 1-hexadecene, $C_6H_6$, MePh, *o*-, *m*- and *p*-$Me_2C_6H_4$, EtPh, mesitylene, cymene, pseudocumene, PrPh, BuPh, iso-BuPh, AmPh, iso-AmPh, cyclohexane, cyclohexene, methylcyclohexane, *m*- and *p*-dimethylcyclohexane, 3 isomeric methylcyclohexenes, naphthalene, $\alpha$-methylnaphthalene, $\beta$-methylnaphthalene, 1,6-dimethylnaphthalene, 2,6-dimethylnaphthalene, decahydronaphthalene, tetrahydronaphthalene, biphenyl, $Ph_2CH_2$, $Ph_3CH$, PhCH:CMePh, anthracene, hexahydroanthracene, phenanthrene, retene, methylisopropylphenanthrene, fluorene, chrysene and bisdiphenyleneethene. J. B. AUSTIN

**The problem of a continuous Raman effect in liquids.** R. BÄR. *Z. Physik* **79**, 455–70(1932).—It has previously been found that if the primary light is circularly polarized in the right-handed direction, and if the Raman effect is studied parallel to the incident beam, the scattered radiation is circularly polarized in the left-handed direction. This instance is now used to det. if the continuous background of Raman spectrograms is due to fluorescence or to a continuous Raman effect. The continuous background could in all cases be explained either as fluorescence or to be due to the unmodified radiation. The following compds. have been studied: *benzene, benzaldehyde, glycerol, sulfuric acid, nitric acid* of various concns., *formic acid, KOH soln.*, binary mixts. of *MeOH-hexane* and *MeOH-*$CS_2$. EGON BRETSCHER

**Raman effect in solutions of copper salts.** A. DA SILVEIRA. *Compt. rend.* **195**, 652–3(1932); cf. *C. A.* **26**, 4254, 5496, 5845.—The Raman effect of $CuSO_4$ is $\Delta\nu$ = 607, 729, 977, 1472, 1671, 279(?), 450, 618, 983, (1058, 1110, 1143), 1476, 1654 cm.$^{-1}$; that of $Cu(NO_3)_2$ $\Delta\nu$ = 279, 442, (717, 754), 1048, (1325, 1421), 1476, 1654 cm.$^{-1}$. The frequencies 1058, 1110 and 1143 represent a triplet. As a first approximation the sulfate ion presents the symmetry of a regularly centered tetrahedron and possesses 4 modes of vibration, 2 of which are degenerated triplets. In the nitrate the 3 frequencies of the nitrate ion are found but the 2 degenerated rays are doubled. These are represented by $\Delta\nu$ = 715–754, 1325–1341 cm.$^{-1}$. A $\Delta\nu$ of 1654, which S. attributes to $H_2O$, is noted. JAMES H. HIBBEN

**Molecular scattering of light from ammonia solutions. The fine structure of a vibrational Raman band.** JOHN W. WILLIAMS AND ALEXANDER HOLLAENDER. *Phys. Rev.* **42**, 379–85(1932).—The Raman band of the $NH_3$ mol. corresponding to the infra-red absorption at 3 $\mu$ has been partially resolved into its fine structure. The expts. were made with aq. solns. of $NH_3$ of relatively high concns. The moment of inertia about a line normal to the axis of symmetry calcd. from the spacing of the lines is $I = 2.82 \times 10^{-40}$ g. sq. cm. BERNARD LEWIS

**Infra-red spectra of ammonium salts in the region of their anomalous specific heat.** R. POHLMAN. *Z. Physik* **79**, 394–420(1932).—Absorption spectra of $NH_4Cl$, $NH_4Br$, $NH_4NO_3$ and $(NH_4)_2SO_4$ were measured in the region 2.5–9 $\mu$ between room temp. and 80°. The curves for absorption coeffs. (for const. wave length) as functions of the temp. show discontinuities at the same temp. at which the sp. heat is anomalous. This effect is due to the $NH_4$ radical, but its course is strongly affected by the nature of the anion, *e. g.*, the transparency for the 6.96 $\mu$ band of $NH_4Cl$ decreases strongly at the crit. temp. while it increases very much for the same band of $NH_4Br$. A fine structure is observed in the case of $NH_4NO_3$, pointing to a possible rotation of the $NH_4$ group in the crystal. EGON BRETSCHER

**Raman spectra of a series of normal alcohols and other compounds.** R. W. WOOD AND GEORGE COLLINS. *Phys. Rev.* **42**, 386–92(1932).—The Raman spectra of $C_6H_6$, cyclohexane and cyclohexene, $CS_2$, BuBr, and the normal alcs. from MeOH to $C_{12}H_{25}OH$ were investigated. New lines were found in all cases, and for some compds. the no. was nearly doubled. Two new frequencies at 2660 and 2750 cm.$^{-1}$ were found in the spectra of essentially all the alcs. and BuBr. They appear to be characteristic of the satd. hydrocarbons. The lines of the aliphatic hydrocarbons at 1450 and 1300 cm.$^{-1}$ have been attributed to the transverse vibrations of the hydrogens of the $CH_2$ and $CH_3$ groups, resp. The Raman spectra of $C_{12}H_{25}OH$ is that of an infinitely long normal alc. The new lines of $C_6H_6$ reported by Weiler (*C. A.* **25**, 5094) and Krishnamurti

(*C. A.* **25**, 1732) were verified with the exception of 806 cm.$^{-1}$ In addn. a new line was found at 1690 cm.$^{-1}$. The 2 relatively strong lines of $CS_2$ at 650 and 800 cm.$^{-1}$ were found to be doublets and the analogy with $CO_2$ was thus completed.

BERNARD LEWIS

**Preparation of residual-ray plates and the reflection power of powders.** R. BOWLING BARNES. *Phys. Rev.* **43**, 31–3(1933).—Residual-ray plates were prepd. (1) of natural crystal surfaces, (2) of surfaces of fused and then recrystd. substances, and (3) of pressed crystal powders. The residual rays resulting from reflection upon these 3 types of surfaces were compared. The wave length of the reflection was in each case the same. The intensity of the residual rays of type (2) was the same as that of type (1). The reflection power of the 3rd type, the pressed powders, depended inversely on the size of the particles of the powder. In cases where no pressure is applied to the surface, the reflection power of a powder decreases as the particle size is made smaller.

BERNARD LEWIS

**Color centers of the latent image in electrical fields.** O. STASIW. *Nachr. Ges. Wiss. Göttingen, Math.-physik. Klasse* **1932**, 261–7.—The motion of color centers in KCl crystals at 350° was studied in elec. fields. The color centers move to the anode. From the elec. cond. of the crystal, these moving particles seem to be electrons. The color centers consist of a loose combination of cation and electron which can be broken even by thermal agitation. The no. of color centers calcd. from elec. data agrees with that from optical data.

E. J. ROSENBAUM

**Photographic photometer for the ultra-violet region of the spectrum.** A. POSPELOV AND B. YAMPOLSKII. *J. Phys. Chem.* (U. S. S. R.) **3**, 514–20(1932).—A Keil photometer for the region 250–400 mμ is described. Absorption spectra are given for methyl violet and nitrosodimethylaniline.

F. H. RATHMANN

**Molecular fluorescence of antimony.** JEAN GENARD. *Nature* **131**, 132(1933).—A rather strong fluorescence of diat. Sb vapor (at 950° and a pressure corresponding to a temp. 650°) was obtained when illuminated by an Hg arc of high luminosity. Four Hg lines excite a resonance spectrum, and possibly 2 others do also. The frequencies can be accounted for by the equation, $\nu = \nu_0 - 277(v'' + 1/2) + 0.68(v'' + 1/2)^2$. Details will be published later.

L. W.

**The ultra-violet absorption of binary liquid mixtures. I. The ultra-violet absorption of the system: acetone–chloroform.** ROBERT KREMANN, MAX PESTEMER AND PAULA BERNSTEIN. *Monatsh.* **61**, 351–60(1932).—The absorption of mixts. ranging from 1.06 to 82 mols. % of acetone (I) was detd. with an app. previously described (*C. A.* **26**, 2120). The extinction coeff. (κ) shows a max. at 275 mμ, log κ, increasing from 0.4 to 2.2 with increase of I. It also shows a min. which moves from 260 to 220 mμ with increase of I.

J. B. AUSTIN

**The interpretation of the ultra-violet absorption bands of the alkali halides.** M BORN. *Z. Physik* **79**, 62–8(1932).—The ultra-violet absorption bands of the alkali halides are generally attributed to a transition of the electron of the neg. ion to the pos (mutual neutralization of neighboring ions). With energy considerations and by use of the more accurate repulsion potential (*C. A.* **26**, 5840) it is shown that the above stated interpretation of the ultra-violet absorpt on bands cannot be correct. As suitable modification it is suggested that the colored centers must be located on the "internal surface" of the crystal (cracks in the crystal lattice).

E. B.

**Efficiency of carbon dioxide as a radiochemical catalyst.** CHAS. ROSENBLUM *J. Phys. Chem.* **37**, 53–8(1933).—$CO_2$ is an inefficient catalyst in radiochem. reactions In $H_2O$ synthesis the efficiency is approx. 14.5%; in $C_2H_2$ polymerization only 30% of $CO_2$ ionization is used in promoting the reaction. The inefficiency of a radiochem. catalyst may be governed by the tendency of the inert gas to cluster about gaseous ions, crowding out reactant mols., and the greater this tendency, the less the efficiency

I. J. PATTON

**The photochemical reaction between quinine and dichromic acid. II. Kinetics of the reaction.** GEO. S. FORBES, LAWRENCE J. HEIDT AND F. PARKHURST BRACKETT, JR *J. Am. Chem. Soc.* **55**, 588–96(1933); cf. *C. A.* **26**, 2378.—It is assumed that clusters of quinine mols., $H_2Cr_2O_7$ mols. and H ions are important in the photochem. reaction. Seven wave lengths in the range 405 to 208 mμ were used. Within exptl. error the reaction order is zero for quinine and 0.5 for $H_2Cr_2O_7$. $H_2SO_4$ has a subordinate role in the reaction. With const. quinine concn. an increase in $H_2SO_4$ concn. from 0.004 to 4 mols. per l. shifts the absorption curve 200 cm.$^{-1}$ toward the red. The temp. coeff. is 1.12; this value agrees with that calcd. from the temp. coeff. of the collision no. in a soln.

E. J. ROSENBAUM

**Fluorescence of mercurous chloride in Eder's solution.** I. PLOTNIKOV. *Phot. Korr.* **68**, 211(1932).—HgCl when sepg. under ultra-violet illumination from Eder's soln. shows no fluorescence. Ordinary purchasable calomel, however, when added to

the soln. fluoresces a bright orange-red. Several possible (but unproved) explanations of the difference are suggested. E. R. BULLOCK

**Phosphorescent or luminous composition.** HENRY M. MINES. U. S. 1,891,827, Dec. 20. $SrCO_3$, $CaCO_3$ and $MgCO_3$ are heated in an "oxidizing" furnace, the composite oxide material thus formed is ground and is incorporated with $Li_2CO_3$, $Rb_2CO_3$, Al silicate, carbonaceous material such as starch, S, "phosphorogens" such as Th and Bi nitrates and "luminophores" such as $BaSO_4$ and $Na_2SO_4$ and the mixt. is heated in a non-oxidizing furnace, ground and reheated in a current of dry H. Various modifications are described.

## 4—ELECTROCHEMISTRY

COLIN G. FINK

**Electrolytic extraction of metals.** H. J. T. ELLINGHAM *Sci. J. Roy. Coll. Sci.* **2,** 19–26(1932).—A review. E. H.

**Development of the metallurgical high-frequency furnace.** MANUEL TAMA. *Z. Ver. deut. Ing.* **77,** 199–202(1933). E. H.

**Electrolysis of silver-bearing thiosulfate solutions.** K. C. D. HICKMAN, W. J. WEYERTS AND O. E. GOEHLER. *Ind. Eng. Chem.* **25,** 202–12(1933).—Ag, accumulating in motion-picture fixing baths, is recovered by electrolysis, and the bath is replenished and recirculated. Electrolysis is carried out in large cells with a cathode c. d. of 3 amp./sq. ft. At the anode thiosulfate is oxidized to tetrathionate and trithionate. Vigorous agitation is necessary, as is also the presence of $H_2SO_4$ and of promoting agents. E. G. VANDEN BOSCHE

**An electrochemical investigation of cadmium-silver alloys.** ARNE ÖLANDER. *Z. physik. Chem.* **A163**, 107–21(1933); cf. *C. A.* **26**, 5850.—The e. m. f.'s of the cells: Cd (liquid) | MCl | Cd-Ag (solid), where M = Li, Rb or Cd, were detd. for 71 alloy electrodes from 330° to 555°. Temp. coeffs. were also obtained and the phase diagrams completed. G. M. MURPHY

**Polarographic studies with the dropping-Hg cathode. XXX. Electroreduction and estimation of fructose and sorbose.** J. HEYROVSKÝ AND I. SMOLEŇ. *Collection Czechoslov. Chem. Communications* **4**, 521–30(1932)(in English); cf. *C. A.* **21**, 1917, 2895; **25**, 1740; **27**, 708.—The inversion of sucrose was quantitatively followed polarographically. The velocity const. was not strictly linearly proportional to the $p_H$, but increased more than was expected from the increase in acidity. The electroreduction potentials of fructose and sorbose in neutral or weakly alk. solns. are given as —1.8 v.; the shift in the reduction potential of fructose with dilu. is abnormally large, the values being —1.57 v. for 0.01 *M* soln. and —1.66 v. for 0.001 *M* soln. It is concluded from the large temp. coeff. of the diffusion current due to the reduction of ketoses that they exist in soln. in two tautomeric forms, only one of which is electroreducible. E. B. S.

**Lead-mercurous acetate voltaic cell with acetic acid as the solvent.** GRADY TARBUTTON AND WARREN C. VOSBURGH. *J. Am. Chem. Soc.* **55**, 618–24(1933); cf. *C. A.* **27**, 474.—The e. m. f.'s of the cells Pb(Hg) | $Pb(OAc)_2$.0.5HOAc | Pb(OAc 0.5HOAc, $Hg_2(OAc)_2$ | Hg, with solvents covering a wide range of HOAc-$H_2O$ mixts. and with 3 different solid phases, were measured at 25°. With pure HOAc reproducible values for different cells were obtained. The *heat of formation* of $Pb(OAc)_2.{}^1/_2H_2O$ was detd. as 271.35 kg. cal. L. P. HALL

**The kinetics of electrode processes. II. Reversible reduction and oxidatio processes.** J. A. V. BUTLER AND G. ARMSTRONG. *Proc. Roy. Soc.* (London) **A139** 406–16(1933); cf. *C. A.* **26**, 5500.—The cathodic reduction of methylene blue solns. and the cathodic and anodic behavior of quinhydrone solns. at Pt electrodes showed, over the whole range of currents and concns., transition processes which were ascribed to depletion of the depolarizer in the vicinity of the electrode. L. P. HALL

**Note on the seat of the electromotive force in voltaic cells.** M. DEKAY THOMPSON. *Trans. Electrochem. Soc.* **63**, 3 pp. (preprint)(1933).—The literature is briefly reviewed. It is evident that the potential between 2 metals connected metallically in a "vacuum" or in a gas has nothing to do with the potential of the same metals when combined to form a voltaic cell. C. G. F.

**Alkaline accumulators.** F. WATSON MANN. *Inst. Marine Eng.* **44**, 378–88 (1932).—The Ni-Fe and Ni-Cd type storage batteries are fully described. These cells are rapidly increasing in marine use, especially the Ni-Cd type, because of their longer life, lower maintenance costs, lack of self-discharge and their ability to give almost full capacity at high discharge rates. They are used for emergency purposes, to take up peak loads and to operate telephones. ANN NICHOLSON HIRD

**Electric discharges in liquids. II. Arc discharge in water.** HERBERT D. CARTER AND ALAN N. CAMPBELL. *Trans. Faraday Soc.* **28**, 634–44(1932); cf. *C. A.* **26**, 3734. A const.-flow calorimeter is described for rapid measurements of the heat evolved by the low-tension arc discharge with C electrodes, operating in $H_2O$. Results with this device indicate that the reactions taking place may be slightly endothermal, but over 85% of the input energy is expended in heating the $H_2O$. Definite relationship between the discharge current and chem. reactions has been found, the gas-flow rate (in cc./min.) -current (in amp.) curve being almost linear, but above a certain crit. potential the voltage does not affect the discharge; with a const. current the input wattage has no effect. The chem. reactions which were discussed previously (*C. A.* **26**, 3734) take place entirely on the anode, and further indication of hydroxide formation was obtained The compn. of the gases was altered by raising the discharge temp., increasing temp. causing a decrease in the $CO/CO_2$ ratio in a manner contrary to that predicted by the "thermal" theories: the results obtained in the present work lend strong support to the "electrical" theory. The contradictory evidence at present available regarding the "water gas" equil. at high temps. is noted. The phys. effects of the liquid medium are discussed, and the mechanism of the chem. reactions reviewed in the light of recent work on elec. discharges. EDWARD B. SANIGAR

**The electrical conductivities of solutions of water in sulfur dioxide.** M. DEKAY THOMPSON AND F. C. JELEN. *Trans. Electrochem. Soc.* **63**, 14 pp.(preprint)(1933).—The conductivities of tech. $SO_2$ were detd. at different temps. as a function of $H_2O$ content from 0.0 to 1.3% $H_2O$. There is no appreciable change in cond. when the $H_2O$ content changes from zero to 30 p. p. m.; there is a rapid change in cond. as the water changes from 30 to 900 p. p. m., and a less rapid change from 900 p. p. m. on to satn The cond. of dehydrated $SO_2$ and of dioxide contg. up to 30 p. p. m. is about $10^{-9}$ mho, which is too low to be measured with the usual high-frequency current; $SO_2$ satd. with

$H_2O$ has a cond. of about $10^{-6}$ mho. The lower conductivities were therefore measured with a d. c. reversed every sec. and with a field strength of 990 v. per cm. A const. field strength was necessary for comparison, because these solns. do not obey Ohm's law. The samples were taken from the supply tanks by distn. to a cond. cell from which they could be quickly removed after measurement. Repeated distns. were made before the lowest limiting value was reached. When the $SO_2$ was drawn off into the cond. cell in the liquid state out of contact with the air, the cond. was very much greater than when it was distd. In all solns. the cond. increased with time indefinitely, consequently temp. coeffs. could not be measured accurately. The cond. temp. coeffs. of solns. contg. 0.06% $H_2O$ and less are neg., while the coeffs. of solns. with 0.15% and more are pos. There must be, therefore, a concn. between 0.06 and 0.15% with 0 temp. coeff. Cond. measurements do not offer a good method of detg. moisture in tech. $SO_2$ because of the small change between 0 and 30 p. p. m. of $H_2O$ and because of the large no. of distns. necessary to get reproducible values for cond. It was assumed in this work that any other impurities than $H_2O$ which might be present in the different tanks were const. in amt. The results indicate that this must have been the case. C. G. F.

**The oxidation of sulfur dioxide in the electrodeless discharge.** Sampuran Das Mahant. *J. Indian Chem. Soc.* 9, 417–22(1932).—Mixts. of $SO_2$ and O on exposure to the electrodeless discharge were oxidized to $SO_3$. No thionates or polythionates were found in the products of the reaction. The results indicate that a max. amt. of $SO_2$ is oxidized when the mixt. has a compn. of 60% $SO_2$ and 40% $O_2$. The $O_2$ alone is activated by the discharge and combines with the $SO_2$. It is not known whether this activation of $O_2$ is due to the formation of $O_3$ or due to an activation of $O_2$ as such. H. W. Leahy

**Heterogeneous chemical reactions in the silent electric discharge. III.** Susumu Miyamoto. *J. Chem. Soc. Japan* 53, 914–24(1932); cf. *C. A.* 26, 5499; 27, 233.—15,000 v. was applied to the reaction chamber. The reactions between H and each of the following solid inorg. compds. were studied, and the reaction products in each case were confirmed: $CoCl_2.6H_2O \longrightarrow$ HCl, metallic Co; $NiCl_2.6H_2O \longrightarrow$ HCl, metallic Ni; $CoS \longrightarrow H_2S$; $NiS \longrightarrow H_2S$; $HgSO_4 \longrightarrow HgS$; $Hg_2SO_4 \longrightarrow Hg$, $SO_2$, HgS; $NiSO_4.7H_2O \longrightarrow NiS$; $CoSO_4.7H_2O \longrightarrow CoS$; $Ag_2SO_4 \longrightarrow Ag_2S$, Ag; AgI $\longrightarrow$ no reaction product; $CdSO_4.2^1/_2H_2O \longrightarrow CdS$, $H_2S$; $PbSO_4 \longrightarrow PbS$; $Bi_2(SO_4)_3 \longrightarrow Bi_2S_3$, $H_2S$; $Bi_2S_3 \longrightarrow H_2S$; $MnSO_4 \longrightarrow MnS$, $H_2S$; $MnS \longrightarrow H_2S$; $ZnSO_4 \longrightarrow ZnS$; $FeSO_4.7H_2O \longrightarrow FeS$, $H_2S$; $FeS \longrightarrow H_2S$. T. K.

**Recent developments in electroplating.** M. deKay Thompson. *Metal Cleaning and Finishing* 5, 9–18(1933); cf. *C. A.* 27, 909.—A review of recent, more important technical developments in the electroplating of Cr, Ni, Cd, alloys, Ag, Zn, W, Sn and Pt, together with notes on temp. corrections in measuring throwing power and electroplating on Al. D. Thuesen

**Rhodium plating.** Colin G. Fink and Geo. C. Lambros. *Trans. Electrochem. Soc.* 63, 6 pp.(preprint)(1933).—Rh-plated jewelry, silverware and reflectors are now being marketed. Very little has been published on Rh-plating baths. The authors prepd. the salts for their plating baths by alloying Rh with Pb and Bi and then treating the regulus with acids and alkali, resulting in $Rh(OH)_3.H_2O$. This salt was converted, in turn, into the sulfate, phosphate, chloride and other compds. and plating baths prepd. The $(NH_4)_2SO_4$ bath gave most satisfactory results. Details of baths and operations are given. C. G. F.

**Practical problems involved in commercial electroplating on aluminum.** Harold K. Work. *J. Electrodepositors' Tech. Soc.* 8, 11 pp.(preprint 7)(1933); cf. *C. A.* 27, 910.—W.'s work on the electroplating of Al (*C. A.* 22, 1915; 25, 2370, 2646, 4805) is briefly reviewed, and successful com. processes for the prepn. and plating of Al and Al alloys are described. The etching of Al and its alloys, wrought metal and castings, is given in detail (cf. also *C. A.* 15, 989; 24, 1801), soln. compn. and working conditions being given together with photomicrographs of typical etched specimens and their deposits. The Ni plating of Al and Al alloys is reviewed at some length, and some of the difficulties encountered, and their solutions, are discussed. E. B. S.

**Nickel plating of zinc-base die-castings at high current density.** N. R. Laban. *J. Electrodepositors' Tech. Soc.* 8, 8 pp.(preprint 6)(1933).—Methods, which are in successful com. use, for the prepn. and the Cu- and Ni-plating of Zn-base die-castings prior to Cr plating, are described. The difficulties usually encountered in the successful plating of Zn die-castings are reviewed, and their elimination by the methods given is explained. One essential in the series of operations described is that the articles should pass in a perfectly dry state from the cleaner to the next process. Degreasing is, therefore, done in trichloroethylene vapor (without action on the Zn), and the articles are wiped with a dry cloth before being racked. The extremely thin surface film left by the degreasing process is removed by the subsequent (0.5–1 min.) anodic etch (cf. *C. A.* 25,

3248) which must take place soon after the degreasing, or stains appear on the Zn and produce blisters in the final Cr-plating operation. The articles are rinsed and then Cu-plated, since the direct nickeling of anodically etched Zn is said not to give good results. The Cu plating is done in an ordinary Cu cyanide plating soln. (compn. given) at 50 amp./sq. ft., with not less than 4.5 v. bath voltage at 65°. After being swilled, the articles are dipped in a K H tartrate soln. (essential to the success of the process) or left in it until ready for Ni plating. The Ni plating is done in the following soln.: $NiSO_4 \cdot 7H_2O$, 2.5–3 lb./Brit. gal.; NaCl, 2 oz./gal.; $H_3BO_3$, 3 oz./gal. under the following conditions: temp., 60°; $p_H$, 5.2–5.8; voltage 6–8 v. for 11-in. electrode distance, with depolarized Ni anodes and vigorous agitation. The failures likely to result from the use of ordinary cleaning methods are described, and the working and maintenance of the solns. used in the above process given in detail. EDWARD B. SANIGAR

**The electrodeposition of nickel and chromium.** J. W. CUTHBERTSON. *Metallurgia* **6**, 15–16(1932).—Plating plants are described. J. L. G.

**The economical importance of chrome plating.** RICH. JUSTH. *Oberflächentechnik* **10**, 42–3(1933).—Data on the general use of Cr plating are given; the great advantages obtained by saving due to reduced wear of base metals and the properties of Cr to which this is due are discussed generally. Some statistics on the world production of Cr are added. M. HARTENHEIM

**Surface hardening by chrome plating.** K. ALTMANNSBERGER. *Oberflächentechnik* **10**, 41–2(1933).—The mechanism of the surface hardening effect by electrolytically deposited Cr is discussed. The phys. character of the deposited Cr, especially its hardness, is principally influenced by the H which is absorbed during electrodeposition; Ni absorbs 11 times, Fe 110 times, Cr 250–450 times its vol. The H absorption depends on the c. d. The max. hardness is obtained at 62 amp./sq. dm. and is then 43 times as great as at the normal d. of 16 amp./sq. dm. It is assumed that the H atoms diffuse through the cubic crystal lattice of the Cr and thereby cause a strong deformation of the lattice, which, in its turn, causes the increase in hardness. Thermal treatment can again remove the lattice deformation and thus the hardening effect. The practice of obtaining good Cr deposits is described. Thermal treatment increases the resistance against wear of Cr-plated tools. The base metal and the deposited Cr layer must not form an alloy, as this would change the crystal structure to which the hardness is due. Several practical applications of chrome-plated rolls, cylinders, etc., and other equipment in printing are described, and suggestions made for detecting causes of failures in Cr deposits. M. HARTENHEIM

**A cyanide-free bath for the deposition of copper on steel.** COLIN G. FINK AND CHAAK Y. WONG. *Trans. Electrochem. Soc.* **63**, 8 pp.(preprint)(1933).—The development of large automatic plating installations for strip steel, standard steel parts, etc., has emphasized the inadequacy of the Cu cyanide bath. Besides being decidedly poisonous, it is very unstable, rapidly carbonating during use. To meet the demand for a Cu strike bath, which is relatively stable and which may be followed by an acid bath with perfect safety, the authors have developed a sulfate-oxalate bath which produces a satisfactory Cu deposit in 60 sec. at a c. d. of 10 amp./sq. ft. (1.1 amp./sq. dm.). C. G. F.

**Tantalum and columbium cathodes *vs.* platinum cathodes for electroanalysis.** D. F. CALHANE AND C. MALCOLM ALBER. *Trans. Electrochem. Soc.* **63**, 7 pp.(preprint)(1933).—Ta and Cb cathodes may be successfully employed for the electro-detn. of Cu, Zn, Ag and Ni. The authors' results in all cases compare favorably with those for Pt gauze cathodes. In the detn. of Zn, Ta and Cb have the special advantage that the Zn may be plated directly on the cathode without the deposition of a protective coating of Ag or Cu, as is done in the case of Pt cathodes for Zn. Pt and Cb are practically on a par, with Cb slightly favored, as regards the direct deposition of Zn thereon. The authors confirm the conclusions of other investigators that Ta cathodes give irregular and inaccurate results, unless the cathode surface is mechanically cleaned after every few depositions. If this is done, Ta will give results directly comparable with those for Pt and Cb. Conclusion: Ta and Cb gauze electrodes, as soon as such become available, will give deposition rates comparable with those for Pt gauze. C. G. F.

**Electrolytic zinc plant of the Sullivan Mining Co.** W. G. WOOLF AND R. M. MILLER. *Mining Congr. J.* **17**, 624–7, 640(1931). G. G.

**A simple electrolytic hydrogen and oxygen generator.** D. VON KLOBUSITZKY. *Biochem. Z.* **257**, 478–9(1933).—A 10–12-l. glass jar with wooden cover is used. Through an opening in the center of the cover is inserted a wide-mouthed l. bottle from which the bottom has been removed. The inside electrode at which the gas is generated consists of 3 plates (2 × 3 cm.) of Ni. All connections of the app. are made gas-tight with a mixt. of wax and colophonium. The electrolyte is 20% NaOH. Water is added from time to time. The electrodes should be of pure Ni, but even so they must be replaced oc-

casionally. The app. runs practically automatically on the d. c. lighting current. It is advisable to wash the $H_2$ with acidified $KMnO_4$ and the $O_2$ with 25% KOH.
S. MORGULIS

**Theories of addition-agent action.** ROBERT TAFT. *Trans. Electrochem. Soc.* **63,** 8 pp. (preprint)(1933).—There are at least 2 types of addn.-agent action. In 1 type the addn. agent is actually included within the deposit. Adsorption of addn. agent by metal appears to be the best explanation of this type. In the second type of addn.-agent action the "addition agent" is reduced simultaneously with the metal ion. In such cases as have been studied of this type the addn. agent is not included within the deposit. An explanation of the reduction in cathode polarization which accompanies the use of certain addn. agents is advanced. C. G. F.

**Electric dewatering of slurry.** HEWITT WILSON AND H. G. WILCOX. *Concrete* (Mill Section) **40,** No. 4, 56–9, No. 5, 56–9, No. 6, 55–7(1932).—Lab. tests indicated that limestone and clay both carry a neg. charge and deposit without apparent segregation on the anode. Costs of dewatering by *electrophoresis* are estd. to be approx. equal to costs of evapn. by burning coal. RAYMOND WILSON

Special refractory bricks for the crown of electric furnaces (SOMMER) **19.** Influence of pickling operations on the properties of steel (SUTTON) **9.** Electric glass melting (BESBORODOV) **19.** Cellular concrete, etc. (Ger. pat. 568,196) **20.** Froth flotation mineral separation (U. S. pat. 1,891,776) **9.** Purifying gases (U. S. pat. 1,891,974) **21.** Making goods from rubber dispersions (Brit. pat. 364,552 and 366,044) **30.** Apparatus and process for making artificial threads (Brit. pat. 364,780) **23.** Heat-resistant, fracture-proof cathode-insulating rings (Brit. pat. 363,976) **19.** Purification of gas (Fr. pat. 40,618) **21.** Porous rubber [as separator in accumulators] (Brit. pat. 365,971) **30.**

**Leclanché battery.** "PERTRIX" CHEMISCHE FABRIK A.-G. Fr. 739,162, June 27, 1932. A galvanic element consists in a concd. soln. of $MgCl_2$ with or without the addn. of $MnCl_4$. $NH_4Cl$ is added in the solid or dissolved state to the depolarizing mass.

**Storage battery.** RAYMOND D. SHIPP (to Prest-O-Lite Storage Battery Corp.). U. S. 1,892,288, Dec. 27. Structural features.

**Magnetic material suitable for continuous loading of electrical conductors.** GEORGE LAWTON and WM. H. DEARDEN (to International Standard Electric Corp.). U. S. 1,891,235, Dec. 20. Ferrochrome is used for diffusing Cr into the outer layer of tapes or wires, or Cr may be deposited electrolytically.

**Electrical condenser.** GREENLEAF W. PICKARD (to General Elec. Co.). U. S. 1,892,362, Dec. 27. A metallic armature plate which may be formed of Al carries a coating of S serving as a dielectric and is used with a conductor such as Hg, of lower m. p. than the S coating and in close contact with the latter.

**Electrical resistance.** CLIFFORD A. NICKLE (to The British Thomson-Houston Co., Ltd.). Brit. 366,905, Aug. 9, 1929. Void. A self-reducing resistance consists of Te formed into a solid body, preferably by the simultaneous application of heat and pressure. Molds for manuf. are described.

**Silicon carbide resistor.** ERNEST HEDIGER (to Globar Corp.). Brit. 366,605, Aug. 17, 1929. A resistance of non-metallic material, *e. g.*, SiC, is cured by heat-treating at a temp. below the dissocn. temp. thereof, while it is in an atm. contg. substantial proportions of at least one of the chem. constituents of the resistor and in the field of an elec. current. Such resistors have a pos. temp. coeff. The material used is a mixt. of ordinary SiC and dense SiC from a furnace. Both are powd. and mixed with a small amt. of fine C and Na silicate in $H_2O$.

**Copper iodide rectifier.** WALTHER KRAUSS (to General Elec. Co.). U. S. 1,891,097, Dec. 13. A Pb electrode carrying Pb sulfate on its surface is used in contact with a surface comprising a mixt. of Cu iodide and free I.

**Mercury-arc rectifiers.** THE BRITISH THOMSON-HOUSTON CO. and FRANK P. WHITAKER. Brit. 363,984, July 16, 1930.

**Electrode for vapor electric devices such as mercury-arc devices.** WM. T. ANDERSON, JR., and HUGH D. FRASER (to Hanovia Chemical and Mfg. Co.). U. S. 1,890,926, Dec. 13. Various structural details are described of a device having a Hg electrode in which is immersed a coil of metal of greater heat cond. such as W or Mo which is in contact with the walls of the container (which may be formed of glass or fused silica).

**Electroplating with silver over chromium.** DANIEL GRAY and BURDETTE K. NORTHROP (to Oneida Community, Ltd.). U. S. 1,892,051, Dec. 27. A Ag plating is applied to a Cr surface over an intermediate Cu coating.

**Electrolytic apparatus for removing water from benzine, etc.** GEORGES RASQUIN. Ger. 568,220, Jan. 23, 1930.

**Electric systems for preventing undesired electrolytic action in boilers, condensers**

**or the like.** GEORGE S. NEELEY (one-half to Griffin Watkins). U. S. 1,891,004–5, Dec. 13.

**Electrical contacts of tungsten, etc.** CLEMENS A. LAISE (to Eisler Electric Corp.). U. S. 1,891,050, Dec. 13. Contacts such as those of W or Mo are formed of wrought metal having a finely grained structure (as distinguished from a fibrous or flaky structure).

**Anodic formation of oxide coatings on aluminum.** HELMER BENGSTON (to Aluminum Colors, Inc.). U. S. 1,891,703, Dec. 20. The Al is made anode in an electrolytic cell contg. an electrolyte of coating-forming soln. such as $H_2SO_4$ soln. and, during the coating process, all points of the Al-anode-electrolyte interface are maintained at a const. temp. (as by circulation of the electrolyte). App. is described. Cf. *C. A.* **26**, 5266.

**Electric apparatus for ozonizing air in buildings.** ARTHUR W. CONLEY (to Corozone Co.). U. S. 1,891,916, Dec. 27. Structural details.

**Metals.** ERWIN POPPER. Fr. 738,780, June 17, 1932. A compd. such as an oxide or salt of a metal, in the form of a vapor, mist or suspension is passed through a space to which is applied an intense local heating by means, *e. g.*, of one or more elec. arcs. Thus, $AlCl_3$ is passed in a stream of H through an elec. arc and afterward through an electrostatic field. Al is formed and part of the Cl forms HCl with H.

**Electric-arc treatment of carbonaceous materials.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,045, Oct. 7, 1930. Carbonaceous materials in the gas or vapor phase or in the form of mist or dust are treated with an arc generated by a. c. of not more than 500 cycles under such conditions that the decrease from the no-load tension to the working tension is more than 30%. The current may be rectified if desired. Materials that may be treated include coals, tars, oils and other hydrocarbons, and resinous and asphaltic materials. Treatment may be in the presence of H, N or small amts. of oxides of steam or $H_2S$. The products include $C_2H_2$ and (if N is present) HCN.

**Carbon.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,757, Nov. 17, 1930. See Fr. 720,192 (*C. A.* **26**, 3884).

**Induction furnace.** SIEMENS-SCHUCKERTWERKE A.-G. (Johann Schnepf, inventor). Ger. 568,308, Oct. 31, 1926.

**Inductively heated tunnel kiln.** SIEMENS & HALSKE A.-G. (Fritz Walter, inventor). Ger. 568,217, Sept. 14, 1930.

**Crucibles for induction furnaces.** DEUTSCHE EDELSTAHLWERKE A.-G. Fr. 738,497, June 10, 1932.

**Electric furnace for carbon disulfide production.** CLARENCE C. SCHWEGLER (to Dow Chemical Co.). U. S. 1,892,191, Dec. 27. A plurality of electrodes are laterially inserted into the lower part of a chamber to contain carbon material and are provided with a switch for disconnecting each electrode independently; sulfur vapor inlets are placed below the electrodes with valves for control of these inlets independently. Various structural details are described.

**Collecting electrodes with catch spaces for electrical precipitation apparatus.** SIEMENS-SCHUCKERTWERKE A.-G. (to Lodge-Cottrell, Ltd.). Brit. 366,877, Aug. 30, 1930.

**Electrode-feeding device for electric furnaces.** JAMES G. MARSHALL (to Electrometallurgical Co.). U. S. 1,892,109, Dec. 27. Mech. features.

**Collecting electrodes of electric dust precipitator.** METALLGESELLSCHAFT A.-G Brit. 365,018, July 29, 1931.

**Electrical purification of gases.** SIEMENS-SCHUCKERTWERKE A.-G. Brit. 366,449. Aug. 6, 1929. Void. In a process for the elec. purification of gases the velocity of flow of the gases between the electrodes is greater than 10 m. per sec., this increasing the flash-over voltage by about 80–100% above normal.

**Electrofiltration of gases.** SIEMENS-SCHUCKERTWERKE A.-G. Ger. 568,238, Mar 15, 1931. The gases are given a relatively high or low moisture content according to whether the temp. in advance of the electrofilter is substantially higher or lower than the temp. in the electrofilter.

**Treating gases electrically.** METALLGESELLSCHAFT A.-G. Brit. 367,719, Aug. 4, 1931. In a process for the elec. sepn. of suspended particles from gases the gases, after traversing one or more spiral passages contg. electrodes, are forced to travel in a straight line or have their direction of flow reversed or otherwise deflected while still within the elec. field.

**Electrical precipitation apparatus for cleaning gases.** METALLGESELLSCHAFT A.-G. Brit. 364,491, May 21, 1931.

**Cleaning blast-furnace gases, etc., electrically.** SIEMENS-SCHUCKERTWERKE A.-G. (Robert Strigel, inventor). Ger. 568,123, Mar. 7, 1931. The voltage in the electrofilter is automatically regulated in accordance with the amts. of H and dust in the gases.

**Temperature indicator suitable for use with oil-insulated electrical transformers provided with a water cooling system.** A. C. Tᴀʏʟsaac (to British Thomson-Houston Co., Ltd.). Brit. 353,281, Aug. 16, 1929. Apparatus described suitable for indicating on a scale the load conditions in a transformer.

**Electric system [employing potential from stress on a piezoelectric crystal] for indicating temperature, etc.** H. E. Lɪɴᴄᴋʜ and R. A. J. Kʟᴜɢʀ. Brit. 352,051, March 28, 1929.

**Coating wires, sheets, etc., of oxidizable metals with non-corrosive metals.** D. Bᴀᴜᴅᴇᴡʏɴs. Belg. 388,977, July 30, 1932. Wires to be coated are passed by means of grooved pulleys through a series of baths; in certain of the baths the driving pulleys act as electrodes, while the bath itself consists of an electrolyte which produces a metallic coating on the wire.

**Polarized electrically conductive couple.** Sᴀᴍᴜᴇʟ Rᴜʙᴇɴ (to Ruben Condenser Co.). U. S. 1,891,206, Dec. 13. Polarized Al electrodes are used with a spacer located between the electrodes and composed of a fibrous sheet material such as paper impregnated with a mixt. of a crystd. film-maintaining electrolyte contg. boric acid and borax crystals together with glycerol and water. U. S. 1,891,207 relates to an electrolytic condenser with spaced electrode plates, one of which is electrolytically film-formed, between which is a conductive compn. contg. ethylene glycol and a film-maintaining electrolyte comprising boric, citric, malic, lactic, tartaric or phosphoric acid together with a salt of one of these acids, forming together a crystd. electrolyte.

**High-voltage electrical dehydration apparatus for treating oils, etc.** Rᴀʏᴍᴏɴᴅ T. Hᴏᴡᴇs (one-third each to A. A. Anderson and L. A. Snyder). U. S. 1,891,645, Dec. 20. Structural features.

**Submarine cable materials.** Aʀᴄʜɪᴇ R. Kᴇᴍᴘ (to Bell Telephone Laboratories, Inc.). U. S. 1,892,279, Dec. 27. A submarine cable is described having magnetic material for increasing the inductance, and which, for relieving the magnetic material from strains due to pressure and bending, is filled or surrounded with a pressure-equalizing compd. comprising a polymerized cyclic terpene hydrocarbon such as polymerized turpentine or pine oil mixed with a gum such as balata or a synthetic gum substitute composed largely of hydrocarbon material of the compn. $(C_5H_8)_n$.

**Incandescent lamp.** Tʜᴇ Bʀɪᴛɪsʜ Eʟᴇᴄᴛʀɪᴄᴀʟ ᴀɴᴅ Aʟʟɪᴇᴅ Iɴᴅᴜsᴛʀɪᴇs Rᴇsᴇᴀʀᴄʜ Assᴏᴄɪᴀᴛɪᴏɴ, Hᴇɴʀʏ G. Tᴀʏʟᴏʀ, Wᴍ. Lᴇᴛʜᴇʀsɪᴄʜ and Eᴅᴍᴜɴᴅ B. Wᴇᴅᴍᴏʀᴇ. Brit. 363,775, Nov. 6, 1930. An elec. incandescent lamp of the gas-filled type has a heat-insulating member consisting of an evacuated space interposed between the cap and the gas space.

**Incandescent bulbs, etc.** Vᴀᴛᴇᴀ Rᴀᴅɪᴏᴛᴇᴄʜɴɪsᴄʜᴇ & Eʟᴇᴋᴛʀɪᴢɪᴛäᴛs A.-G. Brit. 363,840, Mar. 4, 1930. See Fr. 708,551 (*C. A.* **26**, 929).

## 5—PHOTOGRAPHY

E. P. WIGHTMAN

**German proposals for standardization of sensitometric methods.** E. Gᴏʟᴅʙᴇʀɢ. *Z. wiss. Phot.* **31**, 81–3(1932); *Phot. Abstr.* **12**, 218.—Negative materials for daylight use are to be tested as follows: Exposure is made behind a neutral wedge, consisting of 30 steps, increasing by 0.1 d. per step, to the standard lamp and liquid daylight filter recommended by the American Standardization Comm. for a period of 0.05 sec. The development is carried out by the brush method in a standard M. Q. developer for an "optimal" time, which will allow for special properties of certain materials, *e. g.*, degree of hardening of film, and render unnecessary the fixing of a rigid temp. of development. The sensitivity is to be measured by the exposure necessary to produce an opal contact density of 0.1 above the fog.

**Influence of inclination of rays on sensitivity of photographic plates.** V. G. Fᴇsᴇɴᴋᴏv and V. A. Kᴜʀᴀɴᴏv. *Bull. acad. sci. U. R. S. S.*, Classe sci. math. nat. **1931**, 1309–11; *Phot. Abstr.* **12**, 213.—The sensitivity does not appreciably diminish until the angle of incidence is less than 45°.

**Spontaneous growth of the latent image between exposure and development. III.** E. R. Bᴜʟʟᴏᴄᴋ. *Sci. ind. phot.* [2], **3**, 201–6, 241–4(1932); cf. *C. A.* **24**, 5243; **26**, 1528.—Satisfactorily concordant results, obtained after removing the cause of a previous irregularity, confirm the reality and probable generality of the spontaneous increase of the developable image, between a light-exposure and development, over a considerable range of materials and conditions. Jausseran's lineal relation between the latent image and the logarithm of its age is, moreover, confirmed and found to hold more accurately when the age is timed from the mid-point of a long exposure than from its beginning. The growth

effect doubtless enters as an error into most of the scientific applications of photography. Further information concerning the nature of this phenomenon and its constancy or variation with conditions not yet considered is apparently necessary before the error which it produces can strictly be compensated or allowed for. E. R. BULLOCK

**The role of alkali in [photographic] development.** G. P. FAERMAN AND N. N. SHISHKINA. *J. Phys. Chem.* (U. S. S. R.) **3**, 390–405(1932).—Developer action is independent of the particular alkali used but dependent on the H-ion concn. NaOH, KOH, $Na_2CO_3$, $K_2CO_3$ with borate, phosphate and acetate buffers and a metol developer were used. Buffer action dets. the constancy of action of the developer. Six tables and six graphs give the results. F. H. RATHMANN

**Standardization of testing of negative materials.** R. LUTHER. *Z. wiss. Phot.* **31**, 83–95(1932); *Phot. Abstr.* **12**, 218.—Exptl. work carried out to test the practicability of the German recommendations is described. Details of the construction and accuracy of a suitable exposure app. with free falling shutter are given. Tests show that wedges of required neutrality are readily obtainable. An M. Q. developer is recommended, and results with this developer, upon a wide range of materials, indicate that, for "optimal" development, times of the order of 10 min. at 15°, 7 min. at 20° and 5 min. at 25° are required. The measurements of sensitivity by the new method are shown to be in good agreement with the working speed, while tests upon the reproducibility of results show that with extreme care an accuracy of ±0.5 step can be obtained (mean of 4 readings). A comparison of measurements carried out in different labs. is being made.

**Duplication of motion-picture negatives.** J. I. CRABTREE AND C. H. SCHWINGEL. *J. Soc. Motion Picture Engrs.* **19**, 891–908(1932); *Phot. Abstr.* **12**, 192.—Tests have been carried out with various emulsions for the master positive and the duplicate negative, the resulting negative always having the same printing qualities as the original. Screen tests are described comparing prints from the original negative with prints from the duplicate negative, the graininess being compared by the min. distance at which the grain can be observed. It is found that to obtain the best result, with Eastman duplicating positive and negative film, it is necessary to develop the positive to a high gamma, 1.85, and the duplicate negative to a low gamma, 0.55. Fine-grain borax developer is recommended for the duplicate negative, and the necessity is emphasized of printing the master positive and duplicate negative so that their min. ds. are 0.4 and 0.3, resp., to avoid poor tone rendering due to the underexposure portion of the curve. Imperfect contact between negative and emulsion in the printer decreases the graininess and the definition. Diffuse printing light, together with perfect contact, reduces definition slightly, but does not alter graininess.

**New uses for aniline black.** H. FREYTAG. *Melliand. Textilber.* **13**, 144(1932); *Phot. Abstr.* **12**, 223.—Irradiation with ultra-violet light of solns. contg. aniline-HCl and suitable oxidizing agents and catalysts, as used in aniline black dyeing, markedly accelerated formation of aniline black pigment. Satisfactory reproduction of images may be obtained by impregnating paper or cotton fabric with a 1–25% soln. of aniline-HCl contg. 5 drops of aq. 4% $K_3Fe(CN)_6$ and 18–24 drops of 10% aq. $NaClO_3$ per 30 cc., covering with a photographic negative, then exposing for about 15 min. to ultra-violet light and removing unchanged aniline, etc., by washing with water.

**Behavior of phenylenediamines in ultra-violet light.** H. FREYTAG. *Melliand. Textilber.* **13**, 322(1932); *Phot. Abstr.* **12**, 223.—Irradiation of moist filter paper and cotton fabric impregnated with solns. contg. about 0.1% of *o*-, *m*- or *p*-phenylenediamine, or mixts. of these, resulted in yellow to brown color formation due to oxidation of the base, which was assisted by the presence of 0.1% $NaNO_2$ and $KNO_3$; the resulting colors were faster to washing when aniline was also present. The process could be adopted for producing photographic prints on fabric as described in the preceding abstr.

**An investigation of the decomposition products of x-ray films.** GRACE BALLARD *Radiology* **20**, 18–31(1933).—Toxic concns., that is, concns. exceeding 0.3%, of HCN were obtained in all expts. on x-ray films of various types except those on cellulose acetate film without the gelatin coating. The amt. of HCN formed decreases as the amt. of available air increases; hence if the films are burned in excess of air, HCN is probably absent entirely. It is formed apparently both in the gelatin coating and at the base of the film. The ratio of HCN formed from the gelatin to that formed from the film base is greater in acetate than in nitrate films. Expts. indicate that the gelatin probably reduces the fire hazard, as it appears to have a depressant influence on film combustion, which is greater in nitrate than in acetate film. In order to decomp. cellulose acetate film, it is necessary to keep it at a high temp., and even then a very incomplete type of combustion results. The cellulose acetate films are, therefore, superior from a safety standpoint, since they are more stable than cellulose nitrate, which decomps. rapidly at

150°, and since much lar[illegible]nts of gases are evolved from flameless combustion of cellulose nitrate films. [illegible] is liberated in smaller quantities in acetate films, while the oxides of N are entirely absent from the gases. CO is the only toxic gas liberated in comparable quantities from both types of film. GEORGE L. CLARK

Fluorescence of HgCl in Eder's solutions (PLOTNIKOV) **3.** Application of the Blair-Leighton equation to x-rays (LESTER, BLAIR) **3.** Electrolysis of Ag-bearing thiosulfate solutions (HICKMAN, *et al.*) **4.** Sizing paper strips for photographic roll-film (Brit. pat. 353,324) **23.**

MERCATOR, G.: **Die photographische Retusche mit besonderer Berücksichtigung der modernen chemischen, mechanischen und optischen Hilfsmittel** nebst einer Anleitung zum Kolorieren von Photographien. 9th ed. Halle: W. Knapp. 61 pp. M. 1.80; bound, M. 2.30.

---

**Color photography.** A. HILGER, LTD., and J. H. DOWELL. Brit. 349,107, Jan. 18, 1930. Optical features.

**Color photography.** SOC. FRANÇAISE DE CINEMATOGRAPHIE ET DE FILMS EN COULEURS KELLER-DORIAN and J. L. VIDAL. Brit. 349,267. Optical features.

**Color photography.** L. O. VAN STRAATEN. Brit. 353,151, Sept. 6, 1929. In producing corrected color-selection transparencies suitable for color photographs or color printing without hand retouching, a strip of material having primary color areas (suitably yellow, blue and red), which are preferably graded, is photographed at the same time as the original, color-selection negatives being taken (suitably with green, violet and orange filters) and negatives also being taken through filters of the primary colors on the strip. From the latter set of negatives compensating transparencies are produced having a d. which corresponds to the inherent visible faults in the images of the primary colors on the strip in the original color-selection negatives. These transparencies are then combined with the corresponding original color-selection negatives to produce corrected color-selection transparencies.

**Screen for color photography.** P. W. SMITH. Brit. 351,498, March 26, 1930. Various details are described for manuf. of multicolor screens by a process involving slicing superposed colored layers of celluloid or the like.

**Filter and prism system, etc., for color photography.** L. T. TROLAND (to Technicolor Motion Picture Corp.). Brit. 349,318, June 15, 1929.

**Coloring photographic images.** A. F. DEGENHARDT. Brit. 348,507, Nov. 12, 1929. In coloring images on a film having an emulsion coating on each side, the images on one side are treated by floating the film over bleaching and dye baths (the bleaching bath being of such compn. that the dye images produced are unaffected by another bleacher), and the film is then immersed in a second bleaching bath and dye bath to color the images on the other side. The first bleaching material may comprise $K_3FeC_6N_6$, KI, KBr, HOAc and ferric $NH_4$ sulfate (the images on this side being dyed blue or green-blue). The second bleacher may contain KI, I and citric acid, the images being dyed orange-red. $(NH_4)_2Cr_2O_7$ also may be added to the first bleacher.

**Renovating cinematograph films.** JAMES G. E. WRIGHT (to The British Thomson-Houston Co., Ltd.). Brit. 364,082, June 28, 1929. Void. Shrunken celluloid films are restored to their original dimensions by softening the gelatin picture layer, *e. g.*, by soaking in $H_2O$, to prevent injury thereto in subsequent operations, soaking the film in a camphor soln. to elongate it, and drying it under tension.

**Sound and color picture cinematographic films.** A. A. P. RICHARD. Brit. 353,579, April 3, 1930. In production of combination film records such as those with lenticular color records in which the picture images are produced by reversal from negative images, the picture images are printed from a positive master film, developed and reversed (suitably with a usual acid permanganate bath which is cleared after the reversal by use of a bisulfite or sulfite) to obtain positive images of Ag halide before the sound record is printed from a negative master record.

**Sound-record images on photographic films.** SOC. FRANÇAISE CINÉCHROMATIQUE (PROCÉDÉS R. BERTHON). Brit. 352,248, July 18, 1929. A film bearing a latent sound record is developed with a developer contg. a Ag salt (suitably ferrous oxalate with $AgNO_3$) to deposit addnl. Ag on the exposed portions of the film.

**Treating photographic sound-record images.** SOC. INDEPENDANTE DE TELEGRAPHIE SANS FIL. Brit. 351,956, March 27, 1929. In treating combination sound- and picture-record films, such as those with records produced in superposition, the metal (such as Ag) forming a sound-record image is replaced by a $BaCl_2$ image (suitably by successive application of $BaCl_2$ soln. acidified with formic acid and HCl) which is

opaque to infra-red and other invisible radiations. Various details and modifications of procedure are described.

**Combination sound- and picture-record films.** B. FREUND (to C. Stahl). Brit. 352,471, April 2, 1929. Various details of app. and operation are described relating to a process in which a combination sound- and picture-film record is made as a negative by first recording the sound and pictures on sep. films, developing one of these, then transferring the developed record onto an unexposed portion of the undeveloped film which bears the other record and finally developing the latter.

**Duplicating photographically recorded sound-record films.** W. D. FOSTER and C. L. OSWALD (to Community Service, Ltd.). Brit. 348,010, Oct. 29, 1928. Light of a selected wave length or group of wave lengths is employed and the sensitive emulsion on the film is suited to the selected light beam and the materials and process of development. For printing a combined sound and picture film with a monochromatic beam approx. 4000 A. U., a comparatively slow emulsion rated between 120 and 200 H. & D. is suitable, with glycine used as a developer. Various details of app. and operation are described.

**Tinting the pictures of combination cinematograph and sound-record films.** K C. D. HICKMAN (to Kodak, Ltd.). Brit. 348,372, May 13, 1929. Various details of app. and operation are described.

**Photographic printing process of the bromoil type.** FRANCIS J. SHEPHERD and FRANK F. RENWICK (to Ilford, Ltd.). U. S. 1,891,784, Dec. 20. See Brit. 341,924 (*C. A.* **27**, 1585).

**Color-photographic printing process.** LESLIE W. OLIVER and WM. G. CLARK (to Colour Photographs (British and Foreign) Ltd.). U. S. 1,891,571, Dec. 20. See Fr 722,405 (*C. A.* **26**, 4001).

**Photographic process employing basic dyes.** I. G. FARBENIND. A.-G. Brit 348,102, Aug. 13, 1929. Sensitive layers contg. a sensitizer together with basic dyes partially or completely decolorized by the action of light are fixed after exposure by treatment with a soln. of $HBF_4$ or a salt thereof in a solvent such as water or alc. having a solvent action on the sensitizer in the sensitive layer, the dyes being thus converted into insol. fluoborates. Various details are given.

**Photographic and photomechanical reproduction.** U. DIEM-BERNET. Brit 353,974, May 16, 1930. A negative of an original design is produced by applying the design on a transparent grainless film such as viscose which is rendered light-sensitive throughout its mass (as with ferric ammonium citrate or with AgCl), the film is exposed to light passing through the superficially applied design, the design is removed from the film and the printed image is finished by photochem. treatment. Various details and modifications of procedure are described.

**Photographic direct positives.** MIMOSA A.-G. Brit. 349,947, Nov. 30, 1928. A translucent film (such as may be cast from a cellulose nitrate soln. contg. $BaSO_4$) is coated with a sensitive Ag emulsion, exposed in a camera, developed and the developed image is reversed.

**Photographic paper negatives.** J. TACKELS. Brit. 348,281, March 13, 1930. Uncoated paper or paper which has been coated with substances such as $BaSO_4$, $CaCO_3$ or starch, etc., is treated with acid such as $H_2SO_4$ in a coating app. and then coated with a Ag emulsion to which has been added 0.2–6% of a fatty or oily substance such as lanolin, petrolatum, liquid paraffin or glycerol, which serves to increase the speed of the emulsion.

**Screen diapositives for the production of printing surfaces.** BEKK & KAUFEN CHEMISCHE FABRIK GES. Brit. 351,201, May 27, 1929. Screen transparencies for the production of printing surfaces, having screen points which can be reduced and enlarged as required, are obtained by printing from a screen negative on a Ag halide plate which has been treated with a dichromate soln. The exposure is prolonged sufficiently to produce a differentially hardened dichromate image, a strong developer such as glycine is used, and various details of auxiliary treatment are described.

**Photographic diazotype prints.** M. RENKER, G. RENKER, H. RENKER and A RENKER (trading as Dürener Fabrik Präparierter Papiere Renker & Co.). Brit. 353, 486, March 22, 1929. Paper is treated with a light-sensitive diazo compd. admixed with ureas or their derivs. such as thiourea or an $NH_4$ salt of an org. acid such as $NH_4$ citrate (which prevents subsequent discoloration of the paper), and development of the print is effected with an excess of alk. developer contg. an azo coupling agent and the excess is immediately removed. Various examples are given.

**Toning and fixing photographic prints.** G. RIVIÈRE. Brit. 353,398, Jan. 26, 1929. Prints on Ag citrate paper are toned and fixed by applying them to the moistened surface of a block of gelatinous material contg. toning and fixing reagents. Washing after toning and fixing requires only a few sec.

**Photomechanical multicolored map printing, etc.** ULLSTEIN A.-G. and M. KERN. Brit. 353,936, April 27, 1929. Two groups of partial originals are first prepd., the members of one group representing the black and differently colored areas of the map or other article and those of the second group representing the black and differently colored line portions of the map or other article such as rivers, railways, etc. Negatives are made from all the partial originals, those representing color records are colored by the 3-color process and those corresponding to the first group are taken through a screen. Printing plates are prepd. from the combined negatives.

**Photographic sensitive materials.** I. G. FARBENIND. A.-G. Brit. 354,274, Jan. 29, 1929. A layer consisting wholly or in part of a cellulose deriv. is sensitized (suitably with Ag salts, a dichromate or diazo compds.), and an image is produced by changes in the phys. or chem. properties of the cellulose deriv. (as by swelling, dissolving or coloring effects). A catalyst such as a suitable heavy metal salt, resins, gums, fillers, dye-pigments, etc., may be included in the layers formed, and various examples and details of procedure and compns. are given, suitable for producing images on cloth, metal plates or other materials. Cf. *C. A.* **27**, 1583.

**Light-sensitive layers.** VEREINIGTE CHEMISCHE FABRIKEN KREIDL, HELLER & Co. Fr. 739,004, June 23, 1932. Layers sensitive to light are made from an artificial resin which is swellable and preferably also sol., *e. g.*, condensation products of urea or thiourea with aldehydes. To avoid irregularities in the layer, wetting or emulsifying agents are added to the sensitized soln. before its application to the support.

**Comparison device for determining the density gradation of photosensitive layers.** I. G. FARBENIND. A.-G. Brit. 353,641, Dec. 20, 1929. A transparent or translucent support is provided with several series of areas of different known graded d., all the series commencing with an area of the same d. and the difference between the d. of the first and last areas of each series increasing from series to series. Comparison is made by superimposition, various details of the operation being described.

**Photographic "bleaching-out" layers.** I. G. FARBENIND. A.-G. Brit. 352,196, June 2, 1930. Bleaching-out layers are prepd. from thioxanthonium and selenoxanthonium dyes (various examples of which are given) with a suitable binding agent.

**Photographic emulsions.** S. E. SHEPPARD and E. P. WIGHTMAN (to Kodak, Ltd.). Brit. 350,996, Feb. 25, 1929. The fogging tendency of a Ag-salt emulsion is minimized by addn. of carbamide, a substituted carbamide, acid amide, substituted acid amide or acid hydrazide in small proportion.

**Photographic intensifiers.** EMILE L. FIEVEZ and UNION CHIMIQUE BELGE, SOC. ANON. Brit. 363,854, Jan. 10, 1931. See Ger. 528,712 (*C. A.* **25**, 5104).

**Photographs rich in contrasts.** I. G. FARBENIND. A.-G. Brit. 350,984, Dec. 21, 1928. Pictures rich in contrasts are produced by employing layers sensitized for infra-red rays and exposing them to light which contains only red and infra-red rays.

**Corrugated rubberized paper supporting ring for sound-reproducing diaphragms.** SPENCER W. MCKELLIP (to Philadephia Storage Battery Co.). U. S. 1,891,566, Dec. 20.

**Photomechanical printing surfaces.** MEISENBACH RIFFARTH & Co. Brit. 348,162, Nov. 7, 1929. In producing photomech. printing surfaces by exposing to light a layer of dichromated colloid on a metal plate and washing away the unexposed colloid, the surface is treated with a mixt. of a dehydrating agent such as alc. and $HNO_3$.

**Printing photographs on cloth.** YOSIGORO TAKEITI. Japan. 94,761, Feb. 26, 1932. A photograph is printed on a cloth painted with $NH_4$ oxalate soln. The figure is developed with $AgNO_3$ soln. and fixed with a soln. contg. NaClO and $H_2C_2O_4$.

**Photomechanical screens.** J. HEIDENHAIN. Brit. 351,626, Aug. 10, 1929. A PbS mirror is formed on a transparent plate such as glass, celluloid or "cellon," coated with a light-sensitive material such as dichromated albumin which is exposed under a ruled line or dot screen, rolled with oil pigment, developed with water to remove the unexposed albumin, dusted with asphalt powder to render the remaining pigmented albumin acid-proof, etched with Fe chloride and finally treated with benzine or the like to wash off the rest of the asphalt. Cf. *C. A.* **27**, 33.

## 6—INORGANIC CHEMISTRY

A. R. MIDDLETON

**Separation of iridium and platinum.** B. G. KARPOV AND A. N. FEDOROVA. *Ann. inst. platine* No. 9, 106–8(1932).—Calomel reduces Pt compds. to the metal on heating solns. to 90–95°. Ir under these conditions is reduced to a trivalent state. A soln. of mixed chlorides is adjusted by diln. to a 1–2% Pt content, calomel is introduced in slight excess and the soln. heated to 90–95° for 2 hrs. with agitation. The filtrate is

partly evapd. in $NH_4Cl$, and a little $HNO_3$ is introduced. Boiling is continued until crystals of $NH_4Cl$ sep. $NH_4$ chloroiridate is sepd. and again treated with calomel for complete sepn. of Pt. The pptd. Pt with excess of calomel is filtered from the soln. of $NH_4$ chloroiridate and is heated in a current of H. W. P. ERICKS

**Preparation of pure iridium hydroxide, $Ir(OH)_4$.** N. K. PSHENITZUIN AND S. E. KRASIKOV. *Ann. inst. platine* No. 9, 135–6(1932).—Pure $Ir(OH)_4$ can be prepd. by gradual addn. of 10% KOH soln. to a 10% aq. soln. of K chloroiridate and heating the mixt. on the water bath. The ppt. formed is washed thoroughly with water and dried in a vacuum desiccator. Compn. of the compd. so prepd. corresponds to the formula $Ir(OH)_4$. W. P. ERICKS

**Preparation of iridium tetrachloride.** N. K. PSHENITZUIN AND S. E. KRASIKOV. *Ann. inst. platine* No. 9, 133–4(1932).—The method of prepn. of $IrCl_4$ introduced by Voegelin, consisting in treatment of $NH_4$ chloroiridate with Cl at low temp., can be carried out at room temp. W. P. ERICKS

**A simple method for the preparation of germanium tetrahalides.** HUGO BAUER AND KARL BURSCHKIES. *Ber.* **B66**, 277–8(1933).—Heat for 8 hrs. under pressure at 170–180°, 10.4 g. of $GeO_2$ with 104 g. of fuming HCl. Remove the $GeCl_4$ by means of a separatory funnel and purify by distn.; it $b_{759}$, 85.5°. $GeBr_4$ (b. 183°) and $GeI_4$ (m. 145–146°) are similarly prepd. B. A. SOULE

**Action of chlorine on metallic oxides.** WALTHER KANGRO AND RICHARD JAHN. *Z. anorg. allgem. Chem.* **210**, 325–36(1933).—The action of Cl, sufficient to cause at least 1% of the metallic oxide to react per hr., started at the following temps: BeO, 1050°; ZnO, 350°; CdO, 450°; $B_2O_3$, no action up to 900°; $Al_2O_3$, 1200°; $TiO_2$, 800°; $V_2O_5$, 500°; $Cb_2O_5$, 800°; $MoO_3$, 500°; $WO_3$, 700°; $U_3O_8$, 900°. A relation of the temp. of chlorination to the at. no. is evident only in such cases where the product is freely volatile. ALFRED HOFFMAN

**The reaction of ammonia with mercurous chloride.** C. RENZ. *Helv. Chim. Acta* **15**, 1316–20(1932).—The black substance obtained by the action of $NH_3 + H_2O$ on HgCl is composed of $HgNH_2Cl$ and a *mercurophotochloride* (a stable adsorption product of Hg on HgCl). L. F. A.

**Constitution of the perchromates.** ROBERT SCHWARZ AND HERMANN GIESE *Ber.* **B66**, 310–15(1933); cf. *C. A.* **26**, 3744.—Three formulas have been suggested for blue K perchromate: $KH_2CrO_7$, $KCrO_5.H_2O_2$ and $KCrO_6.H_2O$. Prepn. and analysis of blue, slightly sol., explosive $TlCrO_6$ indicates that the 3rd formula is correct. *Peroxide linkages* were detd. by adding perchromate to acid $KMnO_4$ contg. a trace of $(NH_4)_2MoO_4$, then detg. the excess of $KMnO_4$. Structural formulas proposed for the blue and the red perchromates represent them as doubled mols., $K_2Cr_2O_{12}$ and $K_6Cr_2O_{16}$, resp., contg. sexivalent Cr and numerous peroxide linkages. B. A. SOULE

**Reactions and properties of nitric oxide and its compounds. III. The reaction between nitric oxide and the alkali salts of nitrosodisulfonic acid.** HEINZ GEHLEN *Ber.* **B66**, 292–7(1933); cf. *C. A.* **26**, 4764–5.—Evidence is offered for the statement that nitrosodisulfonic acid may be considered a deriv. of $NO_2$ in which 1 O has been replaced by 2 $SO_3H$ groups. An alk. soln. of $(KSO_3)_2NO$ (16 g. in 100 cc. of 5% NaOH) will absorb 500 cc. of NO in 2 min. This reagent is superior to $FeSO_4$ for the detn. of NO or for washing gases to effect its removal. B. A. SOULE

**Basic salts. II. Simple basic chlorides of bivalent heavy metals.** ERICH HAYEK *Z. anorg. allgem. Chem.* **210**, 241–6(1933); cf. *C. A.* **26**, 5024.—Bivalent heavy metals in general form basic chlorides of the type $M(OH)_2.MCl_2$. The new compds. $Mn(OH)_2.MnCl_2$, $Sn(OH)_2.SnCl_2$ and $Fe(OH)_2.FeCl_2$ and *mixed crystals* of these with $Zn(OH)_2.ZnCl_2$, $3CdCl_2.ZnCl_2.8H_2O$ and $2HgCl_2.5\ ZnCl_2.12H_2O$ are described. A. H

**Carbon-oxygen linkage in the metal carbonyls.** J. STUART ANDERSON. *Nature* **130**, 1002(1932); cf. *C. A.* **27**, 33.—The Raman effect affords decisive evidence that the CO is present in the mols. of the metal carbonyls as such, the difference between the value 2155 cm.$^{-1}$ found for CO itself, and the doublet 2125 and 2039 cm.$^{-1}$ found in the case of nickel carbonyl being attributable to the modification in the forces operative in the C-O linkage brought about by the coördination of the CO to the metal, and the consequent redistribution of polarities. ALBERT L. HENNE

**The system: calcium oxide–boric oxide.** ELMER T. CARLSON. *Bur. Standards J. Research* **9**, 825–32(1932).—The m. ps. of various mixts. of $CaO$-$B_2O_3$ were detd. by means of heating curves. For each mixt. the calcd. amt. of $CaCO_3$ was first calcined, then mixed with $H_3BO_3$ and heated. The product varied in appearance from a glass to a soft clinker. Mixts. contg. excess of either CaO or $B_2O_3$ were hygroscopic. Four binary compds. were found: $CaO{\cdot}2B_2O_3$, a readily devitrified glass, m. 986° ± 5; $CaO{\cdot}B_2O_3$, long, flat plates, m. 1154° ± 5; $2CaO{\cdot}B_2O_3$, consisting of irregular grains, m. 1298° ± 5; $3CaO{\cdot}B_2O_3$, irregular grains, m. 1479° ± 5. The phase equil. diagram for the system is given. E. G. VANDEN BOSCHE

**"Blue acid."** W. MANCHOT AND HANS SCHMID. *Z. anorg. allgem. Chem.* **210**, 135–44(1933).—The blue acid was prepd. by treating $NaNO_2$ with 99.4% $H_2SO_4$, expelling the air with H and passing in NO, with vigorous shaking. The acid is formed by the addn. of NO to nitrosylsulfuric acid, and not to $H_2SO_4$, according to the equation: $HSNO_5 + xNO = HSNO_5.xNO$. NO compds. of $FeSO_4$ and $CuSO_4$ in $H_2SO_4$ are not derivs. of the blue acid. H. B. VAN VALKENBURGH

**Mercuric bromoiodides.** A. CH. VOURNAZOS. *J. prakt. Chem.* **136**, 41–8(1933); cf. *C. A.* **25**, 469.—Addn. of HI to $HgBr_2$ in $C_6H_6$ produces the sol. $HHg_2Br_4I$. This is also pptd. from the $Me_2CO$ soln. of the K salt by HCl. Cu displaces the Hg in $Me_2CO$ soln. Salts produced were $KHg_2Br_4I$, $ZnHg_4Br_8I_2$, $PbHg_4Br_8I_2$, $HgHg_2Br_4I_2$, $AsHg_6Br_{12}I_3$, $SbHg_6Br_{12}I_3$, $BiHg_6Br_{12}I_3$, $SnHg_4Br_8I_2$ and $SnHg_3Br_{16}I_4$. The structure is therefore $HI.(HgBr_2)_2$, in which the Hg is bound to I by secondary valences. F. D. S.

**Nickel II hexanitrites.** M. MOUSSERON AND R. CARITEAU. *J. pharm. chim.* **16**, 382–7(1932); cf. Cuttica, *C. A.* **16**, 2645; Cuttica and Carobbi, *C. A.* **17**, 1928.—These compds. were obtained, as a rule, by the interaction of a concd. soln. of $Ni(NO_3)_2$ with nitrites of K, Na, alk. earths or heavy metals. The $Ni(NO_3)_2$ soln. was previously deprived of traces of Co by means of $KNO_2$ in the presence of AcOH, which was finally removed by repeated distn. *in vacuo*. The pptd. compds. were washed with acetone contg. 20% $H_2O$. The following nickelonitrites were obtained (the quadrivalent anion $Ni(NO_2)_6$ = *A*): *A*.$K_4$; *A*.$Na_4$; *A*.$Li_4$ (LiCl + $Ni(NO_2)_2$ from $NiSO_4$ and $Ba(NO_2)_2$); *A*.$K_2Li_2$; *A*.$K_3Na$ (no analogous $NH_4$ compd. was obtainable); *A*.$Ca_2$; *A*.$Ba_2$; *A*.$Sr_2$; *A*.SrCa; *A*.CaBa; *A*.$K_2Ca$; *A*.$K_2Ba$; *A*.$K_2Sr$; also *A*.$(NH_4)_2Ca$; finally *A*.$K_2Mg$; *A*.$K_2Cd$; *A*.$K_2Hg$; *A*.$Na_2Hg$. All these compds. are insol. in org. solvents, hydrolyze with $H_2O$, and nearly all crystallize alike (octahedra). They are a well-defined class, proving that the coördinating action of Ni *is* sufficient to produce this type of compd. S. WALDBOTT

## 7—ANALYTICAL CHEMISTRY

W. T. HALL

**Indicators.** G. A. ELLIOTT. *Chem. Eng. Mining Rev.* **25**, 130–6(1933).—Curves, charts and equations are given to illustrate the use and limitations of indicators commonly used in titrations. W. H. BOYNTON

**Experiments with Folin-Dennis reagent and with naphthoresorcinol.** HANS V. EULER, DAGMAR BURSTRÖM AND H. HELLSTRÖM. *Svensk. Kem. Tids.* **44**, 288–90 (1932)(in German).—The phosphomolybdic reagent does not react with tyrosine, phenylalanine, histamine, *l*-histidine, tryptophan, hexuronic acid and yeast nucleic acid. With 40 mg./100 glutathione there is weak color development. Equiv. color densities are given by: 1 mg. uric acid, 0.3 mg. adrenaline, 2.4 mg. cysteine-HCl and 0.8 mg. hexuronic acid. An aq. soln. of hexuronic acid anaerobically prepd. does not give a color with naphthoresorcinol but does give the blue-violet color after air has bubbled through it. The color substance is $Et_2O$-sol. and has an absorption band near the D line. *d*-Fructose does not react in this manner. A. R. ROSE

**Avoidance of anodic losses of platinum in the electrolysis of alkaline and, in particular, ammoniacal solutions.** ERICH REICHEL. *Z. anal. Chem.* **89**, 411–21(1932).—The loss in wt. of a Pt-Ir gauze anode used in the electrolysis of alk. solns. can be prevented by adding hydrazine sulfate or hydroxylamine sulfate to the electrolyte. A series of expts. in the detn. of Zn, Ni or Ga shows that no harmful results are produced by such addn. W. T. H.

**Extraction analysis with two unknowns.** HANS JESSEN-HANSEN. *Z. anal. Chem.* **89**, 422–6(1932).—The errors involved in extn. analyses are shown in expts. with wheat flour. When the gliadin was extd. with alc. the N values obtained ranged from 1.52 to 1.19% when the vol. of 55% alc. varied from 50 to 400 cc. The causes of error are discussed mathematically. W. T. H.

**New methods of standardizing acids and alkalies.** A. H. PETTINGER. *Textile Colorist* **55**, 93–4(1933).—The procedures are described for standardizing acids with borax and alkalies with $NH_4$ salts in the presence of formaldehyde. Bruhn's method for titrating oxalic acid and soda is also described. RUBY K. WORNER

**Electrometric studies of the precipitation of hydroxides. VIII. Standardization of acid solutions by means of mercuric oxide.** H. T. S. BRITTON AND BEATRICE M. WILSON. *J. Chem. Soc.* **1933**, 9–10.—When HgO is dissolved in satd. alkali chloride or *N* alkali bromide soln., the resulting soln. neutralizes 2 HCl for each HgO (cf. *C. A.* **7**, 3726; **11**, 2865; **27**, 683). Results obtained with a glass electrode agree with those obtained with methyl orange. E. B. SANIGAR

**Analytical spectral investigations. XI. New contributions to the methods of**

**quantitative and qualitative spectral analysis.** WALTHER GERLACH AND KONRAD RUTHARDT. *Z. anorg. allgem. Chem.* **209**, 337–55(1932); cf. *C. A.* **26**, 4272.—The fields of application of the interrupted arc, flaming arc, high-frequency spark and hot electrode spark are outlined. The interrupted and flaming arcs are, resp., 100 and 10 times more sensitive than the condensed spark. Methods of procedure and lines employed are given for the detection of Pd and Co, of Ag and Sb in Cu, of Pb in Pt, of Cu in Pt and of Ag, Fe, Ir, Ni, Os, Pd, Rh and Ru in Pt. **XII. The detection of antimony, arsenic and tellurium.** ELSE RIEDL. *Ibid* 356–63.—$2 \times 10^{-5}$ mg. As and $2 \times 10^{-4}$ mg. Te can be detected in solid alloy electrodes. In solns. free from heavy metals 0.01% As and 0.002% Te can be detected with the interrupted and flaming arcs. An electrolytic pptn. micro method for As, Te and Sb is worked out with 1 cc. of soln. A table of relative line intensities is given for the detn. of As. HOWARD AGNEW SMITH

**Volumetric determination of barium.** S. RIVAS GODAY. *Bol. Farm. Mil.* **10**, 202–6(1932); *Chimie & industrie* **29**, 52.—An excess of $K_2CrO_4$ soln. is added to the neutral soln., the ppt. is filtered and its Cr content detd. iodometrically. The results average 1% too low. A. PAPINEAU-COUTURE

**Volumetric determination of lead in solution of lead subacetate.** ZDENĚK REKTOŘÍK. *Časopis Československ. Lékárnictva* **12**, 241–3(1932).—To 15 g. of soln. add successively 2.5 cc. dil. $HNO_3$, 1 g. $CaCO_3$ and 70 cc. $H_2O$, and titrate the soln. with *M* $K_2CrO_4$, with $AgNO_3$ or bromothymol blue as indicator. WILLIAM J. HUSA

**β-Naphthol test for copper.** CHARLES C. FULTON. *Am. J. Pharm.* **105**, 62–3 (1933).—Dissolve 0.04 g. β-naphthol in 2 cc. alc.; add 0.5 cc. of 6 *N* $NH_4OH$ soln., and follow at once with 5 cc. of the aq. soln. to be tested for Cu. An ammoniacal soln. of β-naphthol in dil. alc. has a light pink color. In the presence of Cu it becomes a cloudy yellowish green with an oily appearance. The test detects 1 part of Cu per 3,000,000 of soln. W. G. GAESSLER

**The copper content of sea water.** W. R. G. ATKINS. *J. Marine Biol. Assoc United Kingdom* **18**, 193–7(1932).—Cu was detd. in sea water (10 mg. per cu. m.) by the Na diethyldithiocarbamate method after electrodeposition. C. M. MCCAY

**A color test for magnesium.** L. LA ROSA. *Ann. chim. applicata* **22**, 725–8(1932).—Add a few drops of 0.5% *p*-$C_6H_4(NH_2)_2$ in water to a soln. contg. $Mg^{++}$, and then concd. KOH drop by drop. A reddish-violet ppt. is obtained. The ppt. dissolves in dil. acids to form colorless solns., but the color returns on the addn. of alkali. Salts of the alkali metals do not interfere; Zn and Al give white ppts., which redissolve in excess KOH; Ba and Sr give ppts., but of different colors. Ca alone might be confused, as it gives a violet ppt., but if this is redissolved in tartaric acid soln., and KOH added, only Mg will ppt. out with the characteristic colored ppt. 0.01% of Mg can be distinguished. A. W. CONTIERI

**Determination of sodium by precipitation as sodium uranyl magnesium acetate.** C. S. PIPER. *J. Agr. Sci.* **22**, 676–87(1932).—Bray's modification (*C. A.* **23**, 462) of Barber and Kolthoff's method (*C. A.* **22**, 2898) was found less satisfactory than Kahane's method (*C. A.* **24**, 3457). Moderate quantities of Ca, Ba and $NH_4$ chlorides, and K up to 0.034 g. KCl per detn., do not interfere. Sulfates interfere only when both Ca and sulfate are present and the soly. of $CaSO_4$ is exceeded. Pure solns. of NaCl gave recoveries of 101.5–99.3%. Good recovery of NaCl added to $NH_4Cl$ exts. of *soils* was also obtained, the av. error being 1.0%. P. R. DAWSON

**Determination of vanadium in steel.** ISABURO WADA AND RAIZO ISHII. *Bull Inst. Phys.-Chem. Research* (Tokyo) **11**, 1266–78 (*Abstracts* (in English) published with *Sci. Papers Inst. Phys.-Chem. Research* (Tokyo) **19**, Nos. 394–7)(1932).—A method of detg. the error in the $KMnO_4$ titration for the detn. of V in the presence of $Cr^{+++}$ is outlined. K. KONDA

**Determination of vanadium, chromium and manganese in alloy steels.** WERNER HILTNER AND CONRAD MARWAN. *Z. anal. Chem.* **91**, 401–11(1933).—H. has recently designed a vacuum-tube potentiometer, soon to be described elsewhere, which is accurate and useful, as is shown by the results obtained in detg. Mn, Cr and V in alloy steels. The methods used were similar to those in common use. Steels free from W were dissolved in dil. $H_2SO_4$ and the Cr, V and Mn oxidized by persulfate in the presence of $Ag^+$. The excess persulfate was then destroyed by suitable boiling and the $MnO_4^-$ in the hot soln. was titrated with $Na_2C_2O_4$ soln. Then, in the cooled soln., Cr and V were titrated with $FeSO_4$, and finally the V alone was titrated with $KMnO_4$. If W is present, its complete oxidation is accomplished by treating the $H_2SO_4$ soln. with $HNO_3$; after prolonged boiling, the $WO_3$ is removed by filtration. This ppt. is dissolved in hot NaOH soln. and NaF added. The alk. soln. is made acid and added to the soln. which has undergone the $Na_2C_2O_4$ titration for Mn. In this way any V in the $WO_3$ ppt is recovered. W. T. H.

**New method for the titrimetric determination of small quantities of iodine.** Géza Csegezy. *Magyar Gyógyszerészttud. Társaság Értesitője* **8**, 457–64(1932).—Acidify the neutral or slightly alk. iodide soln. with $H_2SO_4$, add nitrite and some $CCl_4$ or $CHCl_3$. Oxidize the sepd. I with dil. HCl and Cl water to iodic acid, boil off the excess Cl water, cool, acidify, add KI and titrate with $Na_2S_2O_3$. S. S. de Finály

**Determination of small oxygen content in gases.** M. Mugdan and J. Sixt. *Angew. Chem.* **46**, 90–1(1933).—A known vol. of gas reacts upon an ammoniacal cuprous soln., and the resulting blue color is compared with that of an ammoniacal cupric soln. of known strength. A special app. is described. Check results agree well. Karl Kammermeyer

**Determination of sulfur and halogens in combustible materials.** Wolfgang Grote and Heinz Krekeler. *Angew. Chem.* **46**, 106–9(1933).—A new app. is described which permits quant. absorption and detn. of the combustion gases from the material. $SO_2$ and $SO_3$ are absorbed in a 3% soln. of $H_2O_2$, and the products of combustion of halogens are absorbed in 0.1 *N* NaOH contg. 8% of $Na_2S_2O_3$ soln. S is detd. either as $BaSO_4$ or volumetrically, and the halogen as Ag salt. A bibliography of 14 titles is given. Karl Kammermeyer

**Microdetermination of carbon monoxide by iodine pentoxide.** Gustaf Ljunggren and Gösta Frang. *Svensk. Kem. Tids.* **44**, 279–85(1932).—The app. designed by Schläpper-Hoffman (*C. A.* **22**, 925) is improved and reduced to micro size. Twenty-five cc. gas is sufficient for 0.2% CO samples. The liberated I is dissolved in $CCl_4$, and a microburet is used in the titration which is accurate to ±0.0005 cc. CO. Spontaneous liberation of I is reduced to negligible amts. in 25 min. if air is passed through the train. Twenty-five min. is ample for a detn. A. R. Rose

**The determination of nitrate in the sea by means of reduced strychnine.** L. H. N. Cooper. *J. Marine Biol. Assoc. United Kingdom* **18**, 161–6(1932).—The detn. of nitrate in sea water by means of strychnine is reliable if pure materials are used for the reagent. Iodate in small concns. is negligible in its interference. Excess org. matter such as that from plankton must be removed by centrifuging. C. M. McCay

**Nitrate in sea water and its estimation by means of diphenylbenzidine.** W. R. G. Atkins. *J. Marine Biol. Assoc. United Kingdom* **18**, 167–92(1932).—Nitrate is detd. in sea water by mixing 2.5 cc. of sea water with 6 cc. of concd. $H_2SO_4$. After cooling, this mixt. is treated with 1.5 cc. of diphenylbenzidine reagent. This is prepd. by dissolving 20 mg. of compd. in 100 cc. of $H_2SO_4$. The color is compared after 24 hours with a standard nitrate in sea water. Diphenylbenzidine is recrystd. from boiling toluene. $H_2SO_4$ free from $HNO_3$ is prepd. by heating or by adding a small amt. of $H_2S$. In $H_2O$ this color reaction for $NO_3^-$ is increased by NaCl. $Fe^{+++}$ gives the test but is too low in sea water to cause an error. 50 references. C. M. McCay

**Acidimetric determination of alkali nitrites.** B. Stempel. *Z. anal. Chem.* **91**, 413–15(1933).—To 40 cc. of 0.05 *M* hydrazine sulfate soln. in a 300-cc. Erlenmeyer flask, add 20 cc. of alkali nitrite soln. which is neutral to neutral red and heat 20 min. in the water bath. Cool, add 15 cc. of neutral formaldehyde soln., 5 drops of phenolphthalein indicator soln. and titrate with 0.1 *N* NaOH. Standardize the hydrazine soln. by carrying out the above procedure without adding nitrite. One mol. $NaNO_2$ = 1 mol. NaOH. W. T. H.

**Analysis of the ammonium sulfide group in the presence of the phosphate ion.** A. Scheinkmann. *Z. anal. Chem.* **91**, 415–18(1933).—The recommended procedure calls for the pptn. of the group with $(NH_4)_2HPO_4$, $(NH_4)_2S$ and $NH_4OH$ after oxidation of $Fe^{++}$. The filtrate contains only Na and K. After boiling with a little 2 *N* AcOH, the ppt. contains $CrPO_4$, $FePO_4$, NiS, ZnS and CoS and $AlPO_4$. In the filtrate, Ba, Sr and Ca are pptd. as oxalates, and this ppt. after filtration is converted to carbonates by boiling with $Na_2CO_3$, and then the usual procedure is followed. To the filtrate from the oxalate pptn. $(NH_4)_2SO_4$ is added to remove traces of Ba and Sr, and then $MnO_2$ together with $Mg(OH)_2$ is pptd. by adding NaOH and $H_2O_2$. The $Mg(OH)_2$ dissolves in dil. AcOH and can be detected as usual. The phosphate-sulfide ppt. of Zn, Ni, Co, Fe Cr and Al is treated with dil. HCl in the usual way to dissolve all but NiS and CoS. By adding $NH_4OH$ to the filtered soln., $FePO_4$, $CrPO_4$ and $AlPO_4$ are pptd., leaving Zn in soln. to be detected with AcOH and $H_2S$. By treating the phosphates with NaOH and $H_2O_2$, sol. $NaAlO_2$ and $Na_2CrO_4$ are formed, which can be sepd. as usual. Cf. *C. A.* **25**, 5873. W. T. H.

**Determination of mercurous chloride.** Dénes Kószegi. *Magyar Biol. Kutató Intézet Munkái* **4**, 609–11 (in German 611–12)(1931).—Moisten 2.5 g. substance to form a paste, add 20–25 cc. *N* NaOH, shake, dil. to 100 cc. and filter. Titrate 50 cc. of the filtrate with *N* HCl in the presence of methyl orange. S. S. de Finály

**Formation and properties of thallous thiocarbonate. Specific test for thallium.**

M. PICON. *Ann. chim. anal. chim. appl.* **15**, 56–61(1933).—See *C. A.* **27**, 925. W. T. H.

**Determination of the sulfate ion in sulfonated oils.** FRITZ NEUBER AND HANS WÄCHTER. *Z. anal. Chem.* **91**, 425–32(1933).—Dissolve about 10 g. of the oil in 100 cc. of alc. and heat just below the boiling temp. until the resulting $Na_2SO_4$ ppt. has settled well. With dark oils add at the start 1 cc. of glacial AcOH. Filter and wash the alkali sulfate ppt. with hot alc. Dissolve in hot water and carry out the usual gravimetric detn. as $BaSO_4$. W. T. H.

**Determination of quartz ["free silica"] in dusts.** ADOLPH KNOPF. *U. S. Pub. Health Repts.* **48**, 183–90(1933).—The quartz content of fine dusts was detd. by a combination of petrographic and chem. methods. The latter consisted in grinding, weighing, igniting, HCl treatment, $H_2SiF_6$ treatment, microscopic examn. of residue and volatilization of residue with HF. J. A. KENNEDY

**Destruction of organic substances for toxicological tests.** M. DUYSTER. *Z. Untersuch. Lebensm.* **63**, 501–3(1932).—The dry alc.-free material is heated under reflux for $^1/_2$ hr. at 125° with a mixt. contg. 30 cc. of concd. $H_2SO_4$ and 60 cc. of perhydrol. The mixt. is delivered from a dropping funnel; a tube connected with the top of the condenser dips into the acid mixt. in the funnel or in a beaker to prevent loss of Pb, Hg, etc. S. LAURER

**Applications of the method of destroying organic materials by treatment with sulfuric and perchloric acids to toxicological investigations and industrial hygiene.** R. FABRE AND E. KAHANE. *Ann. chim. anal. chim. appl.* **15**, 49–56(1933).—The method is explained in detail, discussed critically and shown to satisfy most requirements. W. T. H.

**Purification of visceral liquids. New technic for toxicological investigation of alkaloids.** JUAN A. PINTO. *Anales asoc. quím. Argentina* **20**, 168–75(1932).—Dissolve 20 g. of pure, crystd. $SnCl_2$ in 30–40 cc. of water, add 2.5 g. of KOH in a little water, shake until the ppt. dissolves, then make up to 100 cc. Visceral liquids for alkaloid detn., contg. KOAc, are added to this liquid before analysis. E. M. SYMMES

**Detection of barbital in human viscera.** C. STRZYZOWSKI. *Ann. méd. légale criminol. police sci.* **13**, 49–53(1933).—See *C. A.* **26**, 4011. A. PAPINEAU-COUTURE

**Notes on the Thompson-Oakdale method for the determination of halogen in organic compounds.** J. J. THOMPSON AND U. O. OAKDALE. *J. Am. Chem. Soc.* **55**, 1292 (1933); cf. *C. A.* **24**, 2082, 4999.—In this method care must be taken to avoid the presence of $Na_2SO_3$; this may be removed by oxidation with $H_2O_2$. All of the halogen cannot be removed unless the mixt. in the Kjeldahl flask is boiled with a continuous stream of steam passing through the app. for a short time. The $K_2S_2O_8$ must be free from $KClO_4$. C. J. WEST

**Microchemical determination of sulfur in organic substances by titration.** A. FRIEDRICH AND O. WATZLAWECK. *Z. anal. Chem.* **89**, 401–11(1932); cf. *C. A.* **24**, 2402.—Each operation involved in the method was subjected to crit. exptl. study, and as a result, the directions previously given have been modified. W. T. H.

**Determination of fats contained in organic compounds other than a solvent.** ANDRÉ HECQUET. *Ann. chim. anal. chim. appl.* **15**, 61(1933).—Treat 5 g. of finely divided material with a mixt. of 50 cc. of 660 cc. concd. $H_2SO_4$ and 340 cc. of water at —5° in a glass-stoppered 150 cc. tube which is graduated in 0.5 cc. After the sample has dissolved, allow the mixt. to come to room temp., add 50 cc. of $CCl_4$, stir mechanically for 15 min., allow to stand 30 min., stir again for 30 min., and after another hr. read the vol of the solvent. Of this take 20 cc., evap. to dryness and weigh the residue. W. T. H.

**Gravimetric determination of formic acid in the presence of the higher fatty acids.** R. RIGAMONTI. *Ann. chim. applicata* **22**, 744–6(1932).—Neutralize 50 cc. of approx 0.1% $HCO_2H$ soln., add 1 g. $HgCl_2$ and 0.2 g. cryst. $HCO_2Na$ dissolved in very little water. Heat on a water bath for an hr., filter and wash free from $Cl^-$; dry at 105° and weigh the $Hg_2Cl_2$. A. W. CONTIERI

**Micro determination of citric acid by the Thunberg methylene blue method.** ADRIAN C. KUYPER. *Proc. Iowa Acad. Sci.* **38**, 172(1931).—The method depends on the sp. property of citric acid as a H donator to accelerate the decolorization of methylene blue by an enzyme found in cucumber seed. It gives reliable results only when enzyme exts. are prepd. in the same way and used at the same age. Na, Ca and hexose diphosphate do not interfere unless present in concns. higher than those found in the blood. Oxalic acid does interfere because it changes the min. amt. of citrate necessary for max speed of decolorization. The sensitivity is directly proportional to the amt. of methylene blue present in the reaction tube. W. G. GABSSLER

**Formaldehyde titration of hydrazine sulfate.** B. STEMPEL. *Z. anal. Chem.* **91**, [illegible]—Just as $NH_4$ salts and amino acids can be titrated with HCHO soln., with

methyl red as indicator, so can hydrazine sulfate be detd. If considerable alc. is added and phenolphthalein is used as indicator, just twice as much aldehyde is required as with methyl red. W. T. H.

**A test for phenols and for copper.** CHARLES C. FULTON. *Am. J. Pharm.* **105**, 25–9(1933).—The Denigès-Oliver or Cu test is not characteristic of morphine and its derivs., such as heroine, but is a general test for phenols and their Ac derivs., although many phenols have to be tested in alc. soln. rather than aq. As a general test for a phenol, the substance to be tested is dissolved in 5 or 6 drops of alc. on the spot plate; 3 drops of $H_2O_2$ soln. is added, then 2 drops of $NH_4OH$ soln. (about 5 *N*, or 1 + 2), and the mixt. is stirred with a piece of Cu. It is probable that a compd. of Cu with phenol is formed, so that the action of the Cu is not merely "catalytic," as is generally assumed. Some phenols are very sensitive to Cu, and by using such a one this reaction may be made a test for Cu in aq. soln. as follows: the phenol is dissolved in $H_2O$ or alc. as specified, 0.5 cc. each of $H_2O_2$ (3%) and $NH_3$ (5 *N*) are added, and 5 cc. of the soln. to be tested. Reactions are shown for various proportions of Cu with morphine, thymol, 4-hydroxy-1,2-dimethylbenzene and resorcinol. Morphine will detect about 1 part of Cu in 3,000,000 of soln., the others about 1 part in 1,000,000. W. G. GAESSLER

**Determination of thymol.** C. V. BORDEIANU. *Z. anal. Chem.* **91**, 421–5(1933).—By treating about 0.1 g. thymol with a weighed portion of about 0.5 g. HgO dissolved in 1.5 cc. of AcOH and subsequently diluted with 1 cc. of water, there is formed at the water-bath temp. an insol. di-Hg compd. In the filtrate from this ppt., the excess Hg can be titrated with thiocyanate. The results are accurate to within about 0.5% of the actual thymol content. W. T. H.

**Microchemical characteristics of hydroxyflavone compounds, their localization in vacuoles.** A. GUILLIERMOND AND R. GAUTHERET. *Compt. rend.* **196**, 369–71(1933).—Oxyflavonic compds. and tannin, provided they do not exist together in the vacuole, can be distinguished by color reactions with the following: alkali hydroxides, $Pb(AcO)_2$, $Fe^{+++}$, $OsO_4$, $AgNO_3$, $NH_4$ chloromolybdate, Na acetotungstate, $K_2Cr_2O_7$ and $CrO_3$, $K_3Fe(CN)_6$, $NH_4OH$, alkaloids, vital stains, $K_2Cr_2O_7$ + $CH_2O$, $CrO_3$ + $OsO_4$. ## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

**The mineralogical work of Charles Friedel.** A. LACROIX. *Bull. soc. chim.* **51**, 1512–27(1932). G. G.

**Helium content of beryl.** WM. D. URRY. *Nature* **130**, 777–8(1932).—Various mechanisms for the production of He in beryls are found insufficient to explain the excess of He found. Such sources must be taken into account in detg. the geological age by means of the He ratio. I. J. PATTON

**Hungarian semseyites.** SÁNDOR KOCH. *Math. naturw. Anz. ungar. Akad. Wiss.* 48, 800–7(1931).—The formula of cryst. semseyite proved to be $9PbS.4Sb_2S_3$ + S, that of a compact occurrence $10PbS.4Sb_2S_3$. A dark-gray mineral on the surface of the latter showed the compn.: $3PbS.Sb_2S_3$ + S, near *boulangerite*. S. S. DE FINÁLY

**Analyses of minerals.** GÁBOR VAVRINECZ. *Magyar Chem. Folyóirat* **38**, 140–4 (1932).—*Metacinnabarite* from Felsöbánya contained Hg 77.68, Fe 5.36, S 14.97, insol.

1.41%, corresponding to 4HgS.FeS. *Stibiconite* from Szomolnok contained $Sb_2O_4$ 69.56, $SiO_2$ 5.90, $Fe_2O_3$ 1.58, $Al_2O_3$ 0.14, CaO 10.07, MgO 0.53, $H_2O$ 12.13%. *Limonite* from Rákos contained $H_2O$ 12.67, $Fe_2O_3$ 83.59, $SiO_2$ 2.93 and CaO 0.81%. *Miemite* from Rakovác, Jugoslavia, consisted of 2 layers contg., resp., FeO 5.86, 5.52, CaO 26.97, 26.90, MgO 19.48, 20.07, $CO_2$ 46.39, 46.51 and insol. 0.46, 1.12%. Iron Al garnet from Lower Tátra contained $SiO_2$ 45.5, $Al_2O_3$ 21.3, FeO 26.9 and MgO 6.3%. Analyses are also given of fresh-water limestones from Tihany and Nauheim, of actinolite and smaragdite from Zillertal and of corundophilites from Helminth and Böckstein. Gypsum crystals were found within the brown coal at Baglyasalja, consisting of $H_2O$ 19.77, CaO 30.58, $SO_3$ 45.06 and $Fe_2O_3$ 4.57%. Epsomite was found in a concrete storeroom where brown coal from Nagymányok was stored and the dripping moisture formed stalactite-like crystals. Its compn. was $H_2O$ 49.80–49.60, $SO_3$ 33.34–33.42, MgO 15.77–14.91, $Fe_2O_3$ 0.54–1.15, insol. 0.17–0.21%. S. S. DE FINÁLY

**X-ray spectra of monazite from Borstovočnyi Mountain.** K. K. MATVEEV. *Bull. acad. sci. U. R. S. S., Classe sci. math. nat.* **1931**, No. 10, 1329–46.—The different grades of monazite studied contained: $SiO_2$ 0.3–1.51, $ThO_2$ 9.74–6.84, $P_2O_5$ 25.84–27.26, $Ce_2O_3$ 32.16–34.0, $La_2O_3$ + $Di_2O_3$ + $Y_2O_3$ 28.5, $Fe_2O_3$ 0.14–0.35 (2.12 in one case), $Al_2O_3$ 0.06–0.22%, CaO and $H_2O$ only traces; residue insol. in water 0.28–0.05%. The x-ray spectrograms indicated the presence of Sm, Gd and Dy, not detected before. The intensities of the lines of Ce and Pr are small because the soft x-rays produced by these elements are largely absorbed by the photographic material. Lines of Er and Yb are also present. The monazite is characterized by a large content of the elements from La to Sm, of which Gd is most abundant. The monazite from Borstovočnyi Mt. is qualitatively similar to that from Norway, but its quant. compn. (as detd. by x-ray spectrograms) is different. G. S. STAMATOFF

**The Cruz del Aire meteorites.** ROBERT E. S. HEINEMAN. *Am. J. Sci.* **24**, 465–70 (1932).—The Fe is fine octahedrite. Analysis gave: Fe 91.00, Ni 7.62, Co 1.16, P 0.24, S 0.09, Si 0.03%, Mn none and Cu trace. ALDEN H. EMERY

**Mineragraphy or the petrology of ores and its economic significance.** F. L. STILLWELL. *Chem. Eng. Mining Rev.* **25**, 113–15(1933).—Some economic results of the use of mineragraphy in Australia are pointed out. W. H. BOYNTON

**Camp Smith sulfide deposits—upper east coast of Hudson Bay.** W. B. AIRTH. *Can. Mining J.* **53**, 53–5(1933).—The deposits are predominantly pyrrhotite with minor amts. of pyrite, arsenopyrite and chalcopyrite. W. H. BOYNTON

**Some mineral deposits on the islands of Saint-Pierre and Miquelon [Newfoundland].** E. AUBERT DE LA RÜE. *Compt. rend.* **196**, 55–7(1933).—Some heavily mineralized parallel bands, evidently zones of enrichment, contain a mixt. of magnetite and ilmenite. Black sands bearing these minerals occur as shore deposits on Miquelon Grand Colombier has a siliceous breccia impregnated with hematite. Analyses are given of 3 types of Fe ore. Cambrian grits on Langlade are impregnated with bornite, with traces of chalcopyrite and pyrite, and with malachite in the outcrops; this rock has shown Cu 27%, and Ag 240 g./ton. Occurrences of minerals elsewhere in the islands are briefly mentioned. A. W. FURBANK

**Beryllium and its raw materials.** ELEMÉR VADÁSZ. *Bányász. Kohász. Lapok* **65**, 462–4(1932).—Bauxites from W. Hungary seem to contain 1.37% BeO. Though in too small an amt. for industrial working up, its presence is important as another new argument against the terra rossa-like formation theory of bauxites. S. S. DE FINÁLY

**Feldspar.** HUGH S. SPENCE. Can. Dept. of Mines, Mines Branch, *Rept.* No. 731, 145 pp.(1932).—Occurrence, production, compn., prepn. and uses of feldspar are discussed. ALDEN H. EMERY

**The accessory components of Hungarian bauxites.** TIHAMÉR GEDEON. *Magyar Chem. Folyóirat* **38**, 134–40(1932); cf. *C. A.* **26**, 5517.—Ni occurs in almost all Hungarian bauxite in amts. varying between 0.001 and 0.01% NiO. $Mn_2O_3$ 0.2, $Cr_2O_3$ 0.07, $V_2O_5$ 0.07, CaO 0.5 and MgO 0.2% were found. Zr and Be could be detected, while K and Na were not present in Gánt bauxites. No S compds. could be found. Carbonate is present because the bauxite usually is underlain by dolomite and overlain by limestone. $P_2O_5$ averaged 0.5%. Twenty-four analyses of Hungarian and foreign bauxites are included. S. S. DE FINÁLY

**Fluorspar deposits in western United States.** ERNEST F. BURCHARD. *Am. Inst. Mining Met., Engrs.' Tech. Pub.* No. 500, 26 pp.(1933).—In the Castle Dome district, Ariz., fluorspar occurs with galena in veins in volcanic rocks. Typically, the veins reach 4 ft. in thickness, and fluorspar sometimes constitutes 40–60% of the vein material. Colorado has occurrences of com. value; at Waggon Wheel Gap fluorspar occurs in sheeted rhyolite, the vein zone extending to a point close to where hot springs emerge, and the latter evidently bear some relation to the fissure vein. At Jamestown fluorspar

is a common vein material; Au, Ag and Pb have also been mined here. There is need for a process for treating the low-grade spar in this district, which carries principally siliceous impurities, as shown by typical analyses. At North Gate the fluorspar is generally in finely cryst. radial masses or in ribbon-like form. Occurrences elsewhere, production and markets are discussed. A bibliography is appended. A. W. F.

**Potash deposits at Solikamsk and Berezniki [Russia].** V. MAIKOVSKY. *Ann. mines* [13], **2**, 177–202(1932).—Drilling carried out in 1925–7 disclosed the existence of extensive K deposits in the region of Solikamsk. Carnallite appears to be present in amt. about 3 times that of the more valuable sylvinite. Although the deposits are important reserves, they are not expected to compete with foreign sources of supply, on account of inadequate transportation facilities. A. W. FURBANK

**The Volkenroda petroleum deposit.** HELMUTH ALBRECHT. *Kali* **26**, 25–33 (1932).—A geological description. *Ibid* **26**, 39–43. Several forms of drilling and well equipment are described. The petroleum, sp. gr. 0.836 and viscosity 1.4 at 20°, brownish green in color, is 25% benzine. An av. anal. of the natural gas is: $CH_4$ 54.5, $C_2H_6$ 12.4, $C_3H_8$ 9.0, $C_4H_{10}$ 3.7, $C_5H_{12}$ and homologs 2.2, $N_2$ 18.0, $O_2$ 0.1, CO 0.1, $CO_2$ 0.0 and $H_2S$ 0.0%. W. L. HILL

**Thermomagnetic properties of volcanic rocks.** RAYMOND CHEVALLIER AND JEAN PIERRE. *Ann. phys.* **18**, 383–477(1932).—A crit. examn. of the methods for studying volcanic rocks as to their magnetic constituents is given. The app. devised for the thermomagnetic investigation is then described. The test specimen is placed in the center of an elec. furnace mounted between the poles of an electromagnet. Thermocouples and galvanometers are so arranged that a beam of light is reflected onto a photographic plate, yielding curves in which the ordinates are proportional to temps. and the abscissas to balance-deflections. Results given for many specimens of lavas, basalts, etc., indicate that the Curie points of volcanic rocks vary continuously and hence the magnetic element is a solid soln. The magnetic element is composed of mixed crystals contg. $Fe_2O_3$, FeO and $TiO_2$. When the concn. of $Fe_2O_3$ exceeds 70%, the Curie point is that of magnetite regardless of the exact compn.; below this amt. the Curie point decreases linearly with concn. The role of Ti is not apparent. The ratio $s = Fe_2O_3/(Fe_2O_3 + FeO)$ seems to det. the Curie point. For 7 lavas the $s$-$T$ curve is a straight line passing through 853°K., corresponding to pure magnetite, and 0°K. for pure FeO. The ratio $r' = Fe_2O_3/(FeO + MgO + CaO)$ for the entire mass seems to vary in the same manner as $Fe_2O_3/FeO$ in the magnetic element. For the lava of 1381 from Mt. Etna, the curves form a regular array without intersections; this is probably due to progressive oxidation from the surface toward the center, giving all possible concns. of $Fe_2O_3$. Conclusion: The magnetic element is a solid soln. and the concns. of the Fe oxides det. the Curie points. A bibliography of 26 titles is appended. W. W. S.

**The alkaline rock-mass of the Haute-Ruvubu [Urundi, Belgian Congo].** J. THOREAU. *Bull. sci. acad. roy. Belg.* **18**, 877–83(1932).—Various alk. rocks of the general type of nephelite-syenite make up a mass about 6 km. in length in the region S. of Rubura. The characteristics of 3 variations of this rock type are described; chem. compn. and magmatic parameters are given, showing a change to a monzonite-nephelinite. A. W. FURBANK

**Mineralogy of the Ukraine "topaz" pegmatite.** B. A. GAVRUSEVICH. *Compt. rend. acad. sci. U. R. S. S.* **A1932**, 173–81.—Analysis of pegmatite showed: $SiO_2$ 74.31, $Al_2O_3$ 13.61, $Fe_2O_3$ 0.49, CaO 0.51, MgO traces, $TiO_2$ traces, $K_2O$ 5.45, $Na_2O$ 4.52%. JAMES SORREL

**The physiography of the mesoeruptivum of some mountains.** ZSIGMOND SZENTPÉTERY. *Act. Lit. Sci. Univ. Hung. Francisco-Josephinae, Sect. Chem. Mineral. Phys.* **2**, 186–209(1932)(in German).—Some analyses of diabase-porphyrites made by E. Polner are worked up and discussed. Specimens from the Tátra Mountains are more acid than those from Bükk Mountain. Melaphyr is not represented in the Lower Tátra. S. S. DE FINÁLY

**The Sierra Nevada as a comagmatic region.** A. A. FITCH. *Am. J. Sci.* **24**, 481–95(1932).—Analyses are given of 81 Mesozoic igneous rocks represented in the Sierra Nevada. From distribution diagrams, 3 magma-suites are computed—amphibole-schist type, granodiorite type and combined type. For the range *si* 120–150 the pre-Tertiary magma-suite of the Sierra Nevada was related closely to the Tertiary (eruptive) suite. The "fundamental basalt" occupies almost the peak of the *c*-curve, and the acid variants and most of the basic variants are poorer in CaO than that basalt. Two hypotheses will explain this: (1) In the Sierra the basic and ultrabasic intrusions are, in general, the earliest, and they appear to be true differentiates. The result would be to increase the CaO and $SiO_2$ in the residuum. (2) The fundamental magma is andesitic rather than basaltic and the curve for *c* shows that for the acid members of the Mesozoic suite the CaO is particularly high. The vol. of acid members of this suite is greater than

that of the basic and ultrabasic ones, suggesting large-scale assimilation of siliceous country rocks followed by differentiation. Such acid fractions are high in alkalies, and their sepn. would result in a residuum impoverished in alkali. The *alk* curve for the Mesozoic suite is below the av. The Sierra Nevada province has been characterized since early Mesozoic by a suite of rocks for which *al*, *fm* and *c* + *alk* are sensibly invariant, while *c* shows a progressive decrease with time and *alk* a corresponding increase. ALDEN H. EMERY

**An examination of the geology and soils of an area in the state of Perak, Federated Malay States.** H. E. F. SAVAGE AND R. G. H. WILSHAW. *Dept. Agr. Straits Settlements Federated Malay States, Sci. Ser.* No. 10, 15 pp.(1932).—An area of recently cleared jungle shows irregular outcrops of granite, schist and limestone; aplite occurs in the form of small intrusions and contains some tourmaline veins. Concentrates collected contained abundant spinel, ilmenite, tourmaline and zircon, and rarely cassiterite. Soil survey work by Belgrave and Dennett (*Malayan Agr. J.* **17**, 175, 179(1929)) is extended, covering 4 soil profiles not recorded here before. The soils are classified on a geological basis. An almost entire absence of surface org. matter was noted, and there were few signs of humus in the soils, bearing out previous observations that it is only under particular circumstances that humus accumulates in the tropics. Decompn. proceeds at a far greater rate than previously supposed to the ultimate products $NH_3$, $CO_2$ and $H_2O$, the fraction capable of but slow oxidation being exceedingly small. A. W. FURBANK

**Weathering of Kiscell clay.** ALADÁR VENDL. *Math. naturw. Anz. ungar. Akad Wiss.* **48**, 237–55(1931).—Pyrite contained in the bluish gray variety of clay is oxidized to limonite, which gives a yellow color. During the process, silicates, *e. g.*, biotite, chlorite and feldspars, are also weathered. This is shown by the ratios of $Fe^{++}$ to $Fe^{+++}$. The mol. ratio $FeO/Fe_2O_3$ in the blue clay is 0.57–2.30, in the yellow 0.11–0.23 The ratio $S/SO_3$ is 0.62–8.37 and 0.27–2.23, resp. The ratio nos. according to Mac Carthy are 0.258–1.033% FeO/% $Fe_2O_3$ in the blue clays and 0.049–0.103 in the yellow ones; this accords with his theory. The mech. compn. of samples varied greatly. The quantity of colloidal particles increased during oxidizing weathering. S. S. DE F.

**Lacustrine concretions of manganese.** E. M. KINDLE. *Am. J. Sci.* **24**, 496–504 (1932).—Saucer-shaped concretions from Ship Harbour Lake, N. S., analyzed $SiO_2$ 12.75 (largely sand grains), heavy metals 0.67, $Fe_2O_3$ 13.74, FeO 7.70, $Al_2O_3$ 12.50, CaO 1.62, MgO 0.58, $H_2O$ 13.58, $CO_2$ and org. matter 0.26 and $MnO_2$ 36.08%. The concretions are deposited from $H_2O$ by the catalytic action of pyrolusite. A. H. E.

**Changes in fiber in a peat bog.** E. V. RAKOVSKII AND V. A. VUISOTSKAYA. *Khim. Tverdogo Topliva* **2**, No. 11–12, 80–92(1931).—The properties of a freshly cut pine tree were compared with those from a tree submerged in a peat bog for 1500–2000 years The air-dry fresh pine tree (I) had 0.65–0.68% ash while the old pine tree (II) had 0.26 0.77%; the solubilities of the fibers were: I 9.45% in hot water and 5.49% in cold water; II 3.12–5.89% and 0.92–2.66%; the yields of the ether exts. were: I 4 57 6.08%, II 10.19–12.57%, and of the alc.-benzene exts. 0.16–0.05% and 0.1%, resp The chem. compns. were: I pentosans 6.82–9.78, hemicellulose 15.69–18.41, cellulose 28.25–32.08 and lignin 29.05–29.84%; II 5.79–8.45, 11.08–16.31, 27.73–34.93 and 29.12–32.33%, resp. I contained according to Willstätter 11.29–13.77% and II 11.98–12 37% MeO. Humic substances were 0 and 19.5%, resp. Properties of the resins, compns of tarry substances, acid nos. of the ether exts., contents of fatty and resinous substances, analyses of the alc.-benzene exts. and resin analyses from both types of trees are given. A. A. BOEHTLINGK

**The geochemical and cosmic abundance of lead.** G. v. HEVESY. *Fortschr Mineral. Krist. Petrog.* **16**, 147–61(1932).—To det. the abundance of Pb, 222 samples of igneous rocks from various sources were grouped in types (granites, etc.). Each group was powd. and mixed, and a portion (25–50 g.) analyzed. Radium D, a radioactive indicator, of known activity was added before analysis. Although the activity was caused by the β-rays of Ra E (an isotope of Bi), trial showed that this was deposited with the $PbO_2$. The silica was eliminated with HF, which was then expelled, and $H_2SO_4$ was added. Most of the Pb was pptd. with the alk. earth sulfates. These were fused with $Na_2CO_3$ and $K_2CO_3$, and the metals recovered as acetates in soln. $Ag_2SO_4$ (1 mg./100 cc.) was added to this soln. and to the mother liquor. Both were heated and satd with $H_2S$. The Pb was electrolyzed out as $PbO_2$ after the usual treatment. The indicator showed 53–100% recovery, and the results were corrected accordingly. To show that the $PbO_2$ contained only traces of Bi and other impurities, it was dissolved and the Pb detd. colorimetrically (cf. *Z. anal. Chem.* **73**, 383(1928); cf. *C. A.* **21**, 1284). The av. Pb content found was $16 \times 10^{-6}$ g./g. rock. The granites had the most ($30 \times 10^{-6}$) and the gabbros the least ($5 \times 10^{-6}$). These values compare fa detns., but are a little higher because of the use of the indicator.

and Th Pb was computed to be about 0.1 of the total. The abundance of cosmic Pb computed from analyses of meteorites is $6 \times 10^{-8}$; this gives Pb 34th place among the elements. This is in accord with spectrographic measurements of the sun.

JOHN EARL MILBERY

**Occurrence of cryoconite in east Greenland pack-ice and its chemical composition.** E. BLANCK, H. POSER AND E. V. OLDERSHAUSEN. *Chem. Erde* **7**, 434–40(1932).—A description of the mode of occurrence is given with analyses of 3 samples, which show the compn. to be: $SiO_2$ 61.12–64.24, $TiO_2$ 0.74–0.84, $Al_2O_3$ 15.19–15.70, $Fe_2O_3$ 6.49–7.38, $Mn_3O_4$ 0.05–0.07, CaO 0.80–1.24, MgO 1.55–2.15, $K_2O$ 1.81–2.30, $Na_2O$ 1.27–1.85, $SO_3$ 0.14–0.18, $P_2O_5$ 0.06–0.09. These values do not agree exactly with those from earlier analyses of cryoconite, with which a comparison is made. W. L. HILL

Development of Dakota lignite (KOTH, LAVINE) **21.** Isotopes of U, Th and Pb and their geophysical significance (PIGGOT) **3.** Crystals of Fe-rich pyroxene from a slag (BOWEN) **9.** Vogtite, isomorphous with wollastonite (BOWEN) **9.**

## 9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, OSCAR E. HARDER AND RICHARD RIMBACH

**Flotation of cassiterite.** G. GERTH. *Arch. Erzbergbau Erzaufbereit. Metallhüttenwesen* **2**, 1–20(1932).—High fatty acids or their salts are suitable flotation agents for cassiterite, and also for quartz, mica and topaz, which accompany it. Cassiterite can be sepd. from these by use of Na oleate, the gang materials being pptd. if a hydrophilic silica gel. can be deposited upon them. H. STOERTZ

**Magnetic dressing of weakly magnetic bodies in free fall and in horizontal projection.** B. GRANIGG. *Arch. Erzbergbau Erzaufbereit. Metallhüttenwesen* **2**, 21–5(1932).—Various machines for this purpose are described. H. STOERTZ

**Reduction works practice at Morro Velho, Brazil.** JACK H. FRENCH AND HAROLD JONES. *Bull. Inst. Mining Met.* **339**, 45 pp.; **340**, 1–15(1932).—The present-day methods of cyaniding a complex quartz-carbonate-sulfide ore contg. pyrrhotite are described in detail. The Au content averages 12 dwt. per long ton, and the Au occurs as an alloy contg 23% Ag. Generally the Au is assocd. with arsenopyrite and in contact with pyrrhotite. The ore is concd. by tabling and then cyanided. Thick pulps are used, since pyrrhotite is such a strong cyanicide that the foul solns. cannot be returned to the circuit. Best results are obtained with low alky., approx. $^1/_2$ lb. per ton. Pptn. is by Zn. Details of these steps and of the refinery practice are given. ALDEN H. EMERY

**The metallurgy of gold in the Transvaal.** B. KUCEVALOV. *Chem. Listy* **26**, 600–4 (1932).—A survey of the geology, mining methods, cyanide and refining processes used for the prepn. of metallic Au. FRANK MARESH

**Chilean gold placer ores and their preparation for dredging operations.** BRUNO GEIER. *Metall u. Erz* **30**, 41–6(1933).—Both the practical and economic aspects of this question are considered. H. STOERTZ

**A new measuring apparatus for testing noble metal washings and eroded ore veins.** J. B. OSTERMEIER. *Metall u. Erz* **30**, 21–4(1933).—App. is described for testing the value of ore deposits and washings, which depends upon the e. m. f. of different ores toward pure Cu. H. STOERTZ

**The consideration of light metals from the commercial and engineering standpoint.** W. FARGES. *Metallwirtschaft* **12**, 59–62(1933). C. E. M.

**Vogtite, isomorphous with wollastonite.** N. L. BOWEN. *J. Wash. Acad. Sci.* **23**, 87–94(1933).—The term vogtite was applied by Hlawatsch to describe some well developed triclinic crystals obtained from a slag of unknown origin (cf. *C. A.* **1**, 833). Similar material was obtained by Hallimond from the slag of an acid hearth steel furnace (*C. A.* **14**, 1279); the compn. was found to be not far from that of a metasilicate, and could be written as (Ca, Fe, Mn, Mg)$SiO_3$, in which Ca exceeds any one of the constituents in brackets but is very much in the minority as compared with the sum of these others. A remarkable agreement is found between the Hlawatsch-Hallimond stereographic projection plot as compared with that of wollastonite having its *b* axis in the pole of the projection. The present work discusses this agreement, which indicates the isomorphism of wollastonite and vogtite; this is of addnl. interest in connection with the problem of bustamite, a Mn-bearing triclinic pyroxene (cf. Sundius, *C. A.* **26**, 4772). Although isomorphism alone does not necessitate the existence of a solid soln. there are the strongest reasons for believing that vogtite is simply a wollastonite solid soln., and the likelihood that bustamite is also a wollastonite is regarded as very great. A. W. FURBANK

**The physicochemical basic laws of metal-slag equilibrium.** FRIEDRICH KÖRBER AND WILLY OELSEN. *Arch. Eisenhüttenwesen* 6, 307–14(1933).—The metallurgical reactions of industrial methods of steel production are considered as chem. transformations in a heterogeneous system of many constituents; the total course of the reaction is principally detd. by the reactions between the 2 liquid phases, melt and slag. The investigation of the equil. between these 2 phases leads to the development of rules for the production of pure metals, many of which are already in practical use. Every metal must be sepd. very thoroughly from its basic metallic impurities, if it is melted in one of its salts, at the lowest possible temp.; it should be sepd. from the rarer impurities only at very high temp. The application of the ideal and the general mass law to metallurgical reactions and the calcn. of heats of formation is explained briefly and exemplified in the manuf. of steel. M. H.

**Facilitating the expulsion of sulfur dioxide from calcium sulfate-calcium sulfide mixtures [blast-furnace slag, converter charge in the smelting of lead ore, etc.] at higher temperatures by iron oxide.** Iv. TRIFONOV. *Metall u. Erz* 30, 46–7(1933); cf. *C. A.* 26, 5885.—The favorable action of $Fe_2O_3$ is attributed to the avoidance of the sulfatization of CaS by $SO_2$. H. STOERTZ

**Crystals of iron-rich pyroxene from a slag.** N. L. BOWEN. *J. Wash. Acad. Sci.* 23, 83–7(1933).—The crystallographic and optical properties of the pyroxenes are discussed, with particular reference to compns. especially rich in Fe. The materials examd. were cryst. products derived from slag from a reverberatory furnace of the United Verde Copper Co., Clarkdale, Ariz.; they consist of interlocking platy crystals from the interstices of which the excess slag has drained away, leaving vug-like spaces contg euhedral crystals of pyroxene suitable for goniometric and optical measurement. The observed and calcd. interfacial angles are tabulated of pyroxene crystals, monoclinic, $a:b:c = 1.0786:1:0.5828$; $\beta = 71°31'$; the optical properties are noted. The indicated content of $FeSiO_3$ is about 80%, a figure far higher than any yet found in either natural or slag pyroxenes. A plot is given showing the compn. of 4 pyroxenes of small optic axial angle (cf. Bowen, *C. A.* 8, 3543), of which the present case is an example. A. W. FURBANK

**Chamber investigations on a 200-ton Siemens-Martin furnace heated with mixed gas.** KURT HÜBNER. *Arch. Eisenhüttenw.* 5, 591–601(1932).—The operation of the furnace was studied when it was heated with a mixt. of coke-oven and blast-furnace gases. Measurements included gas, air and waste-gas vols. and their relation to chamber temps., pressure drop through the grate and heat losses. Good agreement was obtained between theoretical predictions and exptl. results. The results also suggest other improvements in the design of regenerative furnaces. CHANNING W. WILSON

**Operation of cupola furnaces in melting of high-quality gray cast iron.** K. NEUSTAETTER. *Mitt. Forschungsanstalt. GHH Konzern* 2, 112–34(1933).—The quality of a cast Fe produced in the daily routine in a cupola furnace of the Masch. Fabrik Esslingen was investigated and evaluated by quantum-statistical methods, from which the following conclusions can be drawn: The melting capacity increases with increased air quantity under a simultaneous decrease of the tapping temp. With an increasing amt. of air the C content increases at first but decreases for very high quantities of air With increasing tapping temp. the Si content of the melted Fe decreases, but the Mn, P and S contents are not influenced by the amt. of air. The FeO content of the slag is at first reduced by an increasing amt. of air, but the MnO content of the slag is not influenced. The max. of kg. of molten metal per kg. of air is obtained for low quantities of air. Increased air pressure increases melting capacity and reduces tapping temp., the same holds good for high barometric pressures, while high abs. humidity of the air has the opposite effect and reduces the C content of Fe and, apparently, also the S. Increased air humidity increases the hardness of Fe without influencing tensile and bending strength. The melting output and tapping temp. are greater the larger the coke pieces. Rust in the scrap reduces tensile and bending strength and increases hardness somewhat but reduces the C content and increases FeO content of the slag. Varying sizes of scrap pieces do not influence the melt if the percentage is not too high. Sepn. of graphite is reduced by high temp. and low-melting output, as also by low quantities of air and also by a large amt. of rust on the pig iron and the scrap. 46 references M. HARTENHEIM

**Composition and method of using special fluxes for casting magnesium.** R. DE FLEURY AND A. CAILLON. *Compt. rend.* 196, 53–5(1933).—While it is necessary to use $MgCl_2$ in order to include MgO, it is absolutely essential to remove the smallest trace of chlorides from the castings in order to avoid corrosion. The viscosity of protective fluxes is investigated, including those with $B_2O_3$ base (cf. Hardouin, Cochet and de Fleury, *C. A.* 26, 5885). Satisfactory results for industrial purposes were obtained by using 3 fluxes in succession. A basic flux contg. $MgCl_2$ and NaCl is used for fusion. The 2nd is "corrective," and contains $MgF_2$ and $B_2O_3$, with perhaps the addn. of $BaF_2$; refining is carried out between 720° and 750°; the bath is sprinkled with powdered S and with $NH_4HF_2$ in order to avoid any likelihood of fire. The last flux consists of $B_2O_3$ (15%) and $Na_2B_4O_7$, and must be prepd. with absolutely anhyd. materials. It is fluid at first, becoming viscous at about 850° and highly resistant to inclusion by the metal. This method, it is claimed, will prevent all traces of $MgCl_2$ in the finished product and consequently any liability to local corrosion. A. W. FURBANK

**The trend of progress of aluminum.** N. F. BUDGEN. *Metallurgia* 7, 105–8(1933).—Applications of fabricated and cast Al and Al alloys are discussed. J. L. G.

**Determination of the linear transformation velocity of austenite into pearlite.** A. A. BOCHVAR. *Z. anorg. allgem. Chem.* 210, 168–70(1933).—The transformation of austenite into pearlite only commences with about 40° supercooling, at which temp. its velocity is 0.09 mm. per min. At 45° it is 1.0, at 50° 5.3 and at 55° 16.5 mm. per min. H. STOERTZ

**Refined pig irons.** J. E. HURST. *Metallurgia* 7, 115–16(1933).—Properties similar to those of cold-blast irons can be produced by proper blending of refined irons. Alloy irons are being more widely used. The use of special high-C low-alloy materials for adding Cr, Ni, Mo, V, Si, etc., is recommended. J. L. G.

**Martensitic cast iron.** M. WACHLERT AND R. HANEL. *Giesserei* 19, 458–64 (1932).—Drawing extensively on the literature, the authors detd. the influence of (*a*) the alloying elements Si, Ni, Mn and Cr on the hardening ability (I) of gray cast Fe with normal C content, and (*b*) the chem. compn., hardening temp., cooling velocity and annealing temp. on the Brinell hardness, the tensile, bending, compressive and shearing strengths and the structure of the gray cast Fe. Si diminishes I greatly, and therefore its amt. in this cast Fe should be kept as low as possible. Although Mn and Cr increase I, they simultaneously cause a decrease in the machinability. Ni causes an increase in I, while it does not affect the machinability. Micrographs (4) are given. J. BALOZIAN

**Manufacture of stainless iron.** A. L. FELD. *Metal Progress* 23, No. 2, 13–17 (1933).—The alloy is made in basic elec. arc furnaces from ore or scrap and low-C ferrochrome. Some scrap is remelted in induction furnaces. The av. time per heat of 18,000 lbs. is 5 hrs. with 650 kw.-hr. per ton of ingots. Details of melting and processing operations are given. W. A. MUDGE

**Oxygen in iron.** I. FESZCZENKO-CZOPIWSKI AND S. ORZECHOWSKI. *Prace Badawcze PW U* 1931, No. 2, 5–38; *Met. Abstracts* (in *Metals & Alloys*) 3, 362.—A diagram Fe-FeO was constructed. The area of γ-Fe is limited to 0.07% $O_2$ (a number detd. by Inouye). O dissolves in Fe at room temp. up to 0.02%, when at temp. of solidus the soly. increases to 0.13% $O_2$. About 0.21% $O_2$ can be dissolved in liquid Fe at 1370°. The fact that such a low m. p. of Fe in presence of O has not been observed, is the objection to the diagram. However, the diagram can explain the abnormal grain growth during heat treatment of steel contg. O as the O drives out the C from the solid soln. The same explanation can be given to the anomalies in C cementation, and to troostitic spots in quenched steels. A steel not sufficiently deoxidized contains grains of γ-Fe beside the grains of α-Fe. The difference in dilatation of both these kinds of grain during allotropic transformation causes the brittleness of steel. Forty-nine references. G. G.

**Case carburizing of iron and steel in mixtures of sodium cyanide.** M. STROMEYER. *Werkzeugmaschine* 36, 25(Jan. 30, 1932); *Met. Abstracts* (in *Metals & Alloys*) 3, 248.—S. briefly discusses case carburizing with special reference to the salt mixts. used in cyaniding. The following salt mixt. is best: 30% NaCN, 35% $Na_2CO_3$ and 35%

NaCl. This mixt. m. about 635°, is an excellent carburizer and is characterized by a high stability of the NaCN. The procedure to be used is outlined. G. G.

**Zirconium additions to steel and cast iron.** RICHARD TULL. *Heat Treating and Forging* **18**, 471–3(1932).—The influence of small Zr addns. (0.10–0.30%) on the phys. properties of steel and cast Fe is described. Results are given of tests on pearlitic Mn steels with varying C (0.52, 0.42, 0.27%) and Mn (1.15, 1.34, 1.50%) contents, with or without Zr, subjected to one of 4 different heat treatments. These show that the properties of the steels are almost uniformly improved by the treatment with Zr, the ductility and impact resistance being increased and the elastic ratio raised. Further tests show that Zr affects cast Fe in a similar manner to steel. The machinability and resistance to hydrostatic pressure are greatly increased with both steel and cast Fe. The advantages of Zr as a deoxidizing, denitrogenizing and desulfurizing agent with these metals are indicated. J. BALOZIAN

**Classifying steels by sparking.** W. G. HILDORF AND C. H. MCCOLLAIN. *Metal Progress* **23**, No. 2, 23–7(1933).—A description with photographs prepd. for the Recommended Practice Comm. of the Am. Soc. for Steel Treating. W. A. MUDGE

**Influence of pickling operations on the properties of steel.** H. SUTTON. *Rolling Mill J.* **5**, 275–80, 290(1931); *Met. Abstracts* (in *Metals & Alloys*) **3**, 306.—The pickling of Fe and steel usually produces brittleness. The changes in phys. properties are attributed to the presence of absorbed H. The acid cleaning of low- and medium-C steels is not detrimental, and the brittleness produced is but temporary. In 10% $H_2SO_4$ soln., or in an equiv. soln. of $NaHSO_4$, HCl or HF, the degree of brittleness increases also with the temp. of pickling up to 122°F. This embrittling effect disappears gradually at room temp. and more rapidly at higher temps. A heat-treated Ni-Cr steel strip, however, displays very little brittleness after pickling. Electrolytic pickling in $H_2SO_4$ soln. results in severe embrittlement, which disappears on heating to 212°F. Electrolytic pickling in NaOH soln., NaCN or a mixt. of $Na_2CO_3$ and $NaHCO_3$ produces but a slight embrittling. Cracks may develop during pickling in steels that have been subjected to strain and insufficiently annealed. The addn. of 2% $C_5H_5N$ or quinoline to an acid pickling bath may reduce the embrittling considerably. H brittleness may be imparted to steel by the operations of electroplating. This is a more permanent form of brittleness and requires more vigorous attention than does the brittleness resulting from acid pickling. Eleven references are given. G. G.

**Nitrogenization of steel by ammonia and aging phenomena.** I. FESZCZENKO-CZOPIWSKI AND WOJCIK. *Prace Badawcze PW U* **1931**, No. 1, 51–122; *Met. Abstracts* (in *Metals & Alloys*) **4**, 10.—It is suggested that the soly. of N in Fe is greater than that indicated by Fry in his Fe-N diagram. The only steels practically suitable to nitrogenization are the Al and Cr steels, although hard C steels contg. an admissibly great amt. of Si and Mn can be nitrided in some cases. The following conditions were found to be the best for nitriding of Al and Cr steels: 540° as the temp. of process, during 30 hrs. and at 20% of dissocn. of $NH_3$. The results of aging of some nitrided steels are tabulated. The hardening of nitrided steels by aging is more efficient in low-C steels. The superhardening by means of the Herbert's app. "cloudburst" gave more pronounced results, which are tabulated. Forty-eight references are included. G. G.

**The origin of nonmetallic inclusions in steel.** F. LATTA, E. KILLING AND F SAUERWALD. *Kohle u. Erz* **29**, 64–6(Mar. 1, 1932); *Met. Abstracts* (in *Metals & Alloys*) **4**, 16.—Expts. were made on the velocity with which inclusions of fire clay and open-hearth slag ascend in the steel bath. The occurrence of inclusions which are caused by the deoxidation process also was investigated. The velocity with which foreign particles ascend in the steel bath is considerable, provided they are not present as small flakes. The velocity of sepn. of foreign inclusions is high, in particular when the foreign particles coagulate to larger aggregates. The sepn. of inclusions which are the products of the deoxidation process takes more time than that of the artificial inclusions. The latter tests, furthermore, indicate that for correct conclusions the velocity of the chem. reactions of deoxidation must be considered. G. G.

**Cutting steel with oxygen.** C. G. BAINBRIDGE. *Metallurgia* **7**, 101–2(1933).—Steels contg. up to 0.3% C can be cut with O and the cut surface machined. O cutting has little effect on mech. properties. J. L. G.

**Flow lines in forged steel.** EUGENE W. NELSON. *Heat Treating and Forging* **18**, 465–7, 529–30, 534(1932).—Etchings showing flow lines were obtained by carefully cutting the sample in the required direction and polishing on a series of abrasive papers (from 120 mesh to 000 paper) so as to avoid cold work, washing the polished surface with $Et_2O$ or alc. absorbed on a piece of cotton, etching for 15–20 min. at 180°F. with a soln. composed of $H_2O$ (50%), $H_2SO_4$ (12%), and HCl (38%), washing the etched surface with hot $H_2O$ and a stiff brush so as to remove the smut formed, drying with

an air jet and immediately covering with oil to prevent rusting. The theory of flow lines is discussed. J. BALOZIAN

**Heat resistance of aluminum-coated steel.** KONRAD STAUFFER. *Metallwirtschaft* **12**, 73–6(1933).—Sheet-steel test pieces of 0.08–0.29 C content were coated with 140–380 g./sq. m. of Al by the Schoop spraying process. They were then covered with Na silicate to exclude air while they were heated to annealing temp. for 40–100 min. to diffuse the Al into the Fe. The difference in wt. of the plates before and after spraying was taken as the wt. of Al applied. The heat resistance of the samples was detd. by heating them in an electrically heated tube furnace in an atm. of O. The O absorption and tendency to crack on bending were measured. Best protection of the steel and best phys. properties of coating were obtained by an Al coating of 270–350 g./sq. m. With the higher-C steels the coating is more brittle than with the lower-C steels, and the lower-C steels withstand oxidation better. The protection afforded by these Al coatings is very satisfactory up to 1100°. If the oxidation temp. is not over 900° the temp. and time of the preliminary diffusion treatment are not important, as further diffusion takes place. If a heavy coating has been applied it is better to diffuse at higher temps., about 1200°, in order to obtain deeper diffusion. This produces greater uniformity in thickness of coating and reduces the brittleness. C. E. MACFARLANE

**Hard steel pivots and bearings—precision scales require advanced metallurgy.** W. J. BARR. *Metal Progress* **23**, No. 2, 36–40(1933).—A discussion of the manuf., heat treatment and use of special steels and alloys for bearings, pivots, shafts, cams and metal ribbons in the manuf. of precision scales. W. A. MUDGE

**High-speed steels, their constitution and heat treatment.** JOS. WAGNER. *Rev. Tech. Luxembourgeoise* **24**, 149–57(1932).—The historical development of high-speed steel is briefly told; the first kind was made in 1868 by Robert Mushet in Sheffield and contained C 1.5–2, Mn 1–2 and W 7–8%. Cr and V were added later. The particular properties of these steels are due to transformations in the chem. compn. and structure around the point $Ac_3$. Carbides are formed, mostly $Fe_3C$, $Cr_4C$, WC and $V_4C_3$; they are enclosed in the pearlitic mass. Modern high-speed steel generally has a compn. of C 0.7, Si 0.1, Mn 0.1, Cr 5.0, W 19.0 and V 0.3%; the pearlitic mass consists of Fe 80, W 12–15, C 0.5–0.6 and Cr 4%, while the complex carbides consist of Fe 34.5, W 60.0, C 3, Cr 2 and V 0.5%. There exist, therefore, 2 constituents composed of the same elements in different proportions. The Brinell hardness attains in annealed pearlitic high-speed steel 248, in weakly carburized martensitic steel quenched at 900° 524, in strongly carburized austenitic steel quenched at 1300° 614, in strongly carburized martensitic steel quenched at 1300° and drawn at 575° 667. W gives the steel a very fine cryst. structure and acts as hardener; it alloys with Fe in any proportion. Cr also acts as hardener, favors the martensitic formation and improves the tensile properties; it is an indispensable element in high-speed steel. V is used only in small amts.; its action is not quite explained. Mo acts similarly to W, forming $FeMo_2C$. About 5–6% Co has been added recently; it favors soln. of the carbides. U up to 6% also favors soln. of the carbides in quenching. B should not exceed 0.1%, as otherwise the forgeability is impaired; it is, like V, a strong deoxidizer and improves the hardness. Ti acts as deoxidizer and reduces the content of inclusions. Some data are given for the best manner of producing the steel in batches of 120–300 kg., and also micrographs illustrating the behavior. M. HARTENHEIM

**The influence of hot rolling and forging upon the structure of steel alloys.** W. J. MERTEN. *Heat Treating and Forging* **18**, 525–8(1932).—The influence of hot working and of annealing on the cryst. structure of cast, forged and rolled steels is discussed; 7 micrographs are given. J. BALOZIAN

**Metals and alloys. VII. Lattice structure of indium.** E. ZINTL AND S. NEUMAYR. *Z. Elektrochem.* **39**, 81–4(1933); cf. *C. A.* **26**, 2952.—A single crystal of purified In showed face-centered tetragonal lattice with $a$ 4.583 ± 0.002 A. U., $c$ 4.936 ± 0.002 A. U., and $c/a$ 1.077 ± 0.001; d. (calcd. from at. wt. 114.8) 7.308. **VIII. Crystal structure of β-lanthanum.** *Ibid* 84–6.—99.6% La was prepd. in powd. form in N and annealed for several days in a vacuum at 350°. This β-La showed face-centered cubic structure with $a$ 5.296 ± 0.002 A. U. **IX. Alloy phases of the type $NaPb_3$.** *Ibid* 86–97.—$CaPb_3$, cubic with $a$ 4.891 A. U.; $SrPb_3$, tetragonal with $a$ 4.955 A. U., $c$ 5.025 A. U., and $c/a$ 1.014; $CePb_3$, cubic with $a$ 4.864 A. U.; $CaTl_3$, cubic with $a$ 4.794 A. U.; $CaSn_3$, cubic with $a$ 4.732 A. U.; and $CeSn_3$, cubic with $a$ 4.711 A. U., are structurally analogous to $NaPb_3$ (cf. *C. A.* **25**, 3261). Ca, Sr or Ce occupies the (000) layer, and Pb, Sn or Tl the ($\frac{1}{2}$ $\frac{1}{2}$ 0), ($\frac{1}{2}$ 0 $\frac{1}{2}$) and (0 $\frac{1}{2}$ $\frac{1}{2}$) layers. C. L. W.

**Special light alloys for aircraft: the manufacture and uses of the hiduminium R. R. series of aluminum alloys** W. C. Devereux. *Aircraft Engineering* **5**, 6–12(1933).—Numerous photographs, plots and tabulations make a comparison of Rolls-Royce light alloys with other Al alloys in regard to effect of temp. on tensile strength and Brinell hardness, friction tests, fatigue curves, elongation, grain size, etc.
A. W. Furbank

**Hard alloys used for drilling by the Azneft.** G. E. Varshavskii and N. L. Vartametov. *Groznenskii Neftyanik* **2**, No. 7–8, 47–54(1932)(Reports of the First All-Russian Conference on Hard Alloys).—The brazing of fishtail bits used in rotary drilling with hard alloys is effected either by elec. (d. c. current) or acetylene welding. The cutting edge is first covered with a layer, and a second and third layer is then added close to the sides. The lower parts of the sides of the bit must also be provided with a hard alloy because of their wear in drilling operations. The American powd. alloy "Blekor" contains up to 86% of metallic W and its resistance against wear is explained by the W carbides formed in the course of the brazing. The Russian alloy "Dognat" has a ferro-W alloy as the base. It has the advantage of being much cheaper but it wears more rapidly. The alloy "Azneftit" has a ferro-Cr base and its carbides are softer than those of the above alloys. The alloy "Borium" is obtained in small pieces which are welded individually to the bit; it has a W-C base and is characterized by its very great hardness. "Pobedit" is similar to "Borium." "Vokar" contains 8–15% C, 78–85% W, Fe, Mn and other elements. It has the disadvantage of having a variable compn., but it resists wear to a remarkable extent. "Sormait" is used as a base for brazing with "Pobedit" and it is slightly softer. The exact proportions of the metals present in the alloys are not given.
A. A. Boehtlingk

**New metal-cutting alloy.** W. P. Sykes. *Metal Progress* **23**, No. 2, 32–5(1933).—Properties and structures of alloy 548 (Fe-Co-W) are given in tables and photomicrographs.
W. A. Mudge

**The age-hardening of alloys.** C. H. Desch. *Sibley J. Eng.* **46**, 65, 66, 83(Mar., 1932); *Met. Abstracts* (in *Metals & Alloys*) **3**, 327.—The general principles of pptn. hardening are discussed, with the Al-$CuAl_2$ and Fe-$Fe_4N$ diagrams as examples. The development of Lüders' lines revealed in a mild-steel tensile specimen slightly stretched, heated to 200°, by etching in an acid Cu soln. is said to be entirely due to the presence of N, and steels too low in N to show age-hardening do not show the effect. Pptn. of nitride in and resultant brittleness of boiler steel during operation are stated to account for certain instances of boiler failures.
G. G.

**Iron-carbon alloys and the most significant structures of iron.** H. Katzer. *Werkzeug*, Suppl. to *Maschinenkonstrukteur-Betriebstech.* **8**, 66–70(June 10, 1932), *Met. Abstracts* (in *Metals & Alloys*) **4**, 4.—A general discussion of the equil. diagram and the structures of the Fe–C system.
G. G.

**Notes on the copper-rich alloys.** H. C. Anstey. *Metallurgia* **7**, 117–18(1933).—Some com. alloys are described.
J. L. G.

**Phase diagrams of magnesium-zinc alloys.** A. A. Bochvar and I. P. Velichko *Z. anorg. allgem. Chem.* **210**, 164–5(1933).—With 85 atoms % Mg the cast alloy consists of 3 structural elements rather than 2. These are dark primary solid solution, gray eutectic and bright fields of MgZn.
H. Stoertz

**Platinum-cadmium alloys.** K. W. Ray. *Proc. Iowa Acad. Sci.* **38**, 166(1931).—Pt-Cd alloys contg. as high as 50% Pt were prepd. by heating the 2 metals together Solid Pt dissolves in hot molten Cd to form a series of alloys, which have relatively low m. ps. The thermal diagram of a portion of the system was investigated by means of thermal analysis, microscopic study and x-ray examn. Two intermetallic compds. are formed, $Pt_2Cd_9$ and $PtCd_2$. $Pt_2Cd_9$ decomps. at 615° into Cd and $PtCd_2$. $PtCd_2$ m. 725°. $Pt_2Cd_9$ and Cd form a eutectic at 2% Cd, which m. 315°. All Pt-Cd alloys having more than about 6% Pt are very brittle and are much harder than either Pt or Cd. Alloys contg. as much as 35% Pt are exceedingly brittle and have a hardness nearly equal to that of hardened steel. The alloys are white and dissolve in HCl or $H_2SO_4$ to form the corresponding Cd salts. The Pt is left undissolved as black sponge. The Cd volatilizes rapidly when attempts are made to form alloys contg. more than 50% Pt, and a pasty mass is obtained which cannot be melted except under pressure.
W. G. Garssler

**Structure of hypereutectic and hypoeutectic alloys.** A. A. Bochvar and K. V. Gorev. *Z. anorg. allgem. Chem.* **210**, 166–7(1933).—When eutectic alloys are chilled primary crystals of one component sep. in addition to the eutectic. Between these primary crystals and the eutectic, envelopes of the 2nd crystal type are observed. In a series of alloys of Sb, Pb, Bi, Cd and Sn both hypereutectics and hypoeutectics were investigated for each pair. These elements form envelopes in the following order:

Bi, Sb, Cd, Pb, Sn. Each element forms an envelope about those to its left. H. STOERTZ

**Structure of several ternary eutectics.** A. A. BOCHVAR AND K. V. GOREV. *Z. anorg. allgem. Chem.* **210**, 171–2(1933).—The ternary alloys Cd-Pb-Bi, Cd-Pb-Sn and Cd-Sn-Bi form eutectics at 91.5°, 145° and 103°, resp. Their structure is discussed. H. STOERTZ

**The system: gold–manganese.** H. MOSER, E. RAUB AND E. VINCKE. *Z. anorg. allgem. Chem.* **210**, 67–76(1933).—Annealing curves are detd. for Au-Mn alloys from 0 to 100% Au. From 0 to 40% Mn, formation of solid soln. occurs. The m.-p. curve shows a min. at 977° and 12% Mn. At 21.8% Mn the compd. AuMn is formed. Microscopically the alloys contg. 0–22% Mn are homogeneous after long heating at 900–1000°. With higher Mn content, the alloys can no longer be homogenized. A eutectic occurs at about 44% Mn and 1073°. Three transformations occur in the solid state. The first, with 80–100% Mn, occurs at 800, the 2nd is due to an $\alpha$–$\beta$ transformation. The 3rd transformation is a max. at 10–12% Mn and is caused by transformation into a martensite-like structure. The transition from $\gamma$-solid solution to $\delta$-solid solution is accompanied by great hardness increase. H. STOERTZ

**The system: gold–manganese.** H. MOSER, E. RAUB AND E. VINCKE. *Mitt. Forschungsinst. Probieramt Edelmetalle* **6**, 129–36(1933).—The thermoanalytic results of a former investigation (cf. preceding abstr.) were checked by microscopic methods and corroborated. Micrograms showing the structures of different Au-Mn alloys are reproduced. M. HARTENHEIM

**The practical deoxidation of brasses and bronzes.** FERNANDO GONZÁLEZ V. *Rev. quím.* **1**, No. 4, 9–12(1932).—Reduction of dissolved $Cu_2O$ by addn. of a Cu-Mn-Al alloy to the molten metal is described and discussed. L. E. GILSON

**Workability of high brass sheet as influenced by hardness, ductility and grain size.** M. H. MEDWEDEFF. *Metal Progress* **23**, No. 2, 18–22(1933).—A review. W. A. M.

**Apparatus for the determination of the resistance of alloys in hot corrosive liquids.** H. THYSSEN AND J. BOURDOUXHE. *Rev. universelle mines* **9**, 95–7(1933).—A glass app. is described in which the corrosive liquid is both heated and kept in motion; the gases formed by the corrosion can be exhausted and analyzed. M. HARTENHEIM

**Corrosion of iron.** JOHN G. VEAR. *J. Oil & Colour Chem. Assoc.* **16**, 39–49 (1933).—Accepted methods of coating iron and steel are described. Contradictory results often observed are referred to. G. G. SWARD

**Corrosion-resisting steels—their structure and characteristics.** C. M. CARMICHAEL AND G. S. SHAW. *Iron & Steel Can.* **16**, 23–8(1933); cf. *C. A.* **26**, 5284.—A brief review. Suitable compn. and heat treatment provide a sure cure for "weld decay." Some conclusions are noted for the fabrication of stainless steel in the cases of welding, shearing, punching, drilling, sawing, machining, threading and tapping. W. H. BOYNTON

**Corrosion of duralumin rivets.** J. E. SULLIVAN. *Aviation* **30**, 347–9(1931); *Met. Abstracts* (in *Metals & Alloys*) **3**, 292.—The severe corrosion of duralumin rivets in sea water can be traced to wrong heat treatment of the rivets. The rivets should be heated for at least 20 min. to 510°, quenched in plenty of cold water and used within 30 min. Storing the rivets at 0° prevents hardening so that they keep in good condition for use for 24 hrs. G. G.

**Corrosion protection of light metals.** L. SCHIFFER. *Deut. Motorzeit.* **9**, 10–14 (Jan., 1932); *Met. Abstracts* (in *Metals & Alloys*) **3**, 343.—A double-coated duralumin, designated as Duralplat, is discussed. Photomicrographs show the intimate contact due to a diffusion of virgin metal and plate attained by thermal treatment. Enlargements of cross-sections of Brinell indentation marks prove the favorable deep-drawing properties of the plated surface layer which is uniformly deformed with the underlying carrier. The phys. properties of Duralplat coincide with those of the duralumin alloy 681. In corrosion tests duralumin lost 38% of the former elongation, 7% of its tensile strength, whereas Duralplat suffered only negligible losses. G. G.

**The corrosion of high-pressure steam boilers.** E. LUPBERGER. *Elektrizitätswirtschaft, Mitt. d. Ver. d. Elektrizitätswerke E. V.* **31**, 118–19; *Wasser u. Abwasser* **30**, 174(1932).—To inhibit soln. of Fe in high-pressure boilers a $p_H$ of 12.0 is necessary. Even this $p_H$ is not sufficient if the dissolved O is above 0.05 mg. per l. at 30 atm. or 0.01 mg. per l. at 100 atm. F. P. GRIFFITHS

**Investigation of the corrosion of condenser tubes.** P. REUTER. *Elektrizitätswirtschaft* **31**, 6–13(1932); *Wasser u. Abwasser* **30**, 82.—Tubes of marine brass 70/29/1 and Cu: Ni 85/15 were not corroded after 3.5 years. Tubes of brass 62/38 were corroded after one year of service. Trials with 9 other Cu alloys were started. No adequate explanation of the causes of corrosion has been obtained. F. P. GRIFFITHS

**Corrosion in hulls of merchant vessels.** J. MONTGOMERIE. *Trans. Inst. Engrs.*

*Shipbuilders Scotland* **75**, 391–458(1932).—An electrolytic method for protecting tankers consists in adding a sol. ferrous salt to the sea water, when the tank is in ballast, and making the tank structures cathodic to a suitable anodic conductor. Cargoes of oils or molasses have no effect, in themselves, on corrosion but rapidly increase rusting when alternated with sea water used as ballast. Mill scale still adhering to plates develops pitting. Rivets made from "rimming" steel corrode faster because of the segregations. Discussions are added. ANN NICHOLSON HIRD

**Use of a light-diffusion method for determining the liability of metals to corrosion.** FRANÇOIS CANAC. *Compt. rend.* **196**, 51–3(1933).—Precision methods are used to det. optically the extent of corrosion of flat metal surfaces. Dull surfaces diffuse light to a greater extent than polished. Each metal sample was submitted to a series of baths in corrosive liquids, after which the corrosion products were washed and brushed away; the surface was then illuminated by parallel rays at a const. incidence of 30°, and the intensity of the light diffused was detd. Curves are plotted showing the intensity of the diffused light as a function of the period of attack. Diffusion increases with the time, but has a definite limiting value. In general the curves are of 2 types, one following an exponential and the other a parabolic law. A characteristic change of curvature occurs in each type; the time for this to be reached is given for each of several "rustless" and light alloys. Rustless steels treated with $H_2SO_4$ and water give curves of the 1st type; light alloys treated with soda and $H_2O_2$ give the 2nd. The classification obtained is well in accord with those reached by older and better known methods, such as that employing the loss-of-wt. principle, and in much less time. A. W. FURBANK

**Surface protection by chemical processes.** GEO. BUETTNER. *Oberflächentechnik* **10**, 40–1(1933).—The chem. formation on base metals of a layer to protect against corrosion by atm. influences is described, and the various methods of coating Al, Fe, steel, light metals, etc., are reviewed. M. HARTENHEIM

**Some recent developments in welding for the chemical industry.** F. LEVERICK. *Welder* **3**, Jan., 14–18(1932). G. G.

**A new method of welding the extra hard alloy "pobedit." I. Technology of welding and laboratory investigations.** G. E. VARSHAVSKIĬ. *Azerbaĭdzhanskoe Neftyanoe Khozyaĭstvo* **1932**, No. 12, 24–32.—Pobedit, used in drilling wells, is a solid soln. of WC in Co. WC is prepd. by heating for 3 hrs. in a gas furnace a mixt. of C black and W. The resulting powder and finely divided Co are mixed and further pulverized by rotating 35–40 hrs. in a ball mill until the grains are not over 0.0001 mm. in diam. This mixt. is pressed dry under a pressure of 1.5–3 tons/sq. cm. Lower pressures are inefficient, while higher pressures develop cracks in the product. Less pressure is required by fine than by coarse grains. The pressed material is heated ½ hr. at 700–1100° on Ni or C plates and surrounded with C powder in an atm. of H. The alloy is given the desired shape and reheated 3–4 hrs. at 1500°. Pobedit has a sp. gr. of 14–15 depending on the Co content (the higher the sp. gr., the harder the product) and is not affected by heating to 700–750°. Higher temps. are harmful because of formation of oxides of W and Co. The new method of welding it to the drill utilizes yellow Cu (m 1000°) and powd. $Na_2B_4O_7$ (m. 800°) as flux; 20% more alloy is required but it can be reclaimed, its present consumption being thus decreased 30%. **II. Field tests.** N. L. VARTANESOV. *Ibid* 32–7.—The superiority of the new method of welding over present methods was proved in practice. The quality of drills was unimpaired, and the alloy could be reclaimed. V. A. KALICHEVSKY

**The x-ray in the examination of welded pressure vessels.** J. H. GOOLSBY. *Refrigerating Eng.* **25**, 134–9(1933). A. H. JOHNSON

**Nickel-Handbuch.** Edited by M. WACHLERT. **Nickelstähle. Tl. 1. Baustähle. Nickel-Kupfer.** 46 pp. **Tl. 2. Legierungen über 50% Nickel.** 32 pp. Frankfurt: Nickel-Informationsbüro.

**Froth flotation mineral separation.** LOUIS J. O'MALLEY. U. S. 1,891,776, Dec.

20. **An ore pulp such as a Southeast Missouri galena ore is subjected to froth flotation to produce a froth contg. metal values over the froth liquor, and the fractions of the froth that contain the metal values are electrically attracted upward by causing the froth to pass between electrodes having opposite electrical charges at a relatively high potential difference (one of the electrodes being above the surface of the liquor but in elec. contact with the froth).** App. is described.

**Apparatus for roasting and agglomerating ores.** ADRIEN DAWANS. Ger. 568,175, Mar. 23, 1930. This corresponds to Fr. 689,324 (*C. A.* **25**, 905).

**Treating materials such as ores or fumes containing zinc, copper or tin values.** ALLAN R. GIBSON. U. S. 1,891,532, Dec. 20. The material is leached (at ordinary temp. and with substantial exclusion of air) with a soln. formed of $NH_3$ or $SO_2$, one of which is present in excess in the soln. in accord with the metal value which it is desired to ext.

**Direct reduction of iron ore.** WALTER E. TRENT (to Trent Process Corp.). U. S. 1,891,850, Dec. 20. The ore is mixed with low-temp. coke having a substantial volatile H content, the mixt. is heated to a reduction temp. in an atm. of H and CO, reduced iron is sepd. from the gang and excess coke, and the evolved gases are recycled through the reduction zone. App. is described.

**Treating iron pyrites and similar sulfidic material.** STANLEY I. LEVY (to Sulphide Corp.). U. S. 1,891,717, Dec. 20. The material is treated, at temps. up to 1000°, with a chlorinating agent such as Cl, which is substantially free from moisture and H compds., to drive off and recover volatile chlorides substantially free from S chlorides and $FeCl_3$, and to form a residue contg. non-volatile chlorides; ferrous chlorides and chlorides of non-ferrous metals are sepd., Fe is deposited and Cl is liberated electrolytically and the Cl thus liberated is used for the treatment of addnl. sulfidic material.

**Treating titanium ores.** JOHANNES BRODE and GEORG KÄB (to I. G. Farbenind. A.-G.). U. S. 1,891,911, Dec. 27. Decompn of raw Ti ores and removal of Fe from them is effected by directly treating the raw ore with dil. $H_2SO_4$ in the presence of a reducing substance for the ferric ions such as $SO_2$ or a titanous salt.

**Removing silica from oxide ores.** ERNST JUSTUS KOHLMEYER. Brit. 366,015, Apr. 9, 1930. Ores and other materials contg. $SiO_2$ and (or) silicates and oxides of light metals, *e. g.*, Al, Be and Mg, or high-melting heavy metals, *e. g.*, Zr, Cr and V, are mixed with metal sulfides and C and heated so that without melting the Si is driven off as SiS. If ZnS is employed a Zn-Si-S vapor is given off. Other sulfides except $Al_2S_3$, *e. g.*, FeS, may be used. In an example bauxite is mixed with zinc blende and C and heated to 1350–1400°.

**Substitute for "natural feed ore" for use in steel production.** JOHN M. HUGHES, JOSEPH H. CARTER and LEWIS B. PERKINS (to Sharon Steel Hoop Co.). U. S. 1,891,889, Dec. 20. A block is formed from over 93% by wt. of $Fe_3O_4$ and a binder of portland cement.

**Metal values such as zinc from crude oxides.** WM. A. OGG. U. S. 1,892,114, Dec. 27. The crude oxide is spread on a foraminous support and exposed beneath an externally heated wall while a reducing gas is passed up through the support. App. is described.

**Refining metals.** ERNST H. RIESENFELD. Ger. 568,320, Mar. 25, 1930. The molten metal is treated with a paste comprising an oil and a solid adsorbent.

**Refining lead contaminated with copper.** WALTER F. GROSS and CHARLES N. SAPPINGTON (to Am. Smelting and Refining Co.). U. S. 1,891,978, Dec. 27. A portion of the material is removed from a molten bath and caused to flow in a thin stream having an exposed surface, and S is added to the exposed surface at a rate to produce desired reaction, and reaction products are returned to the bath. App. is described.

**Furnace for heat treatment of metals.** WM. E. MOORE and GEORGE L. SIMPSON (to Pittsburgh Research Corp.). U. S. 1,892,112, Dec. 27. Structural features.

**Furnace for reducing iron ores, etc., in an electromagnetic field.** MARIO AMOROSO and SOC. ANON. METALFER-INDUSTRIELS. Ger. 568,241, June 18, 1930. This corresponds to Brit. 358,481 (*C. A.* **26**, 3474).

**Reverberatory furnaces for melting aluminum, etc.** J. SCHÜFFLER (to Wirbelstrahlbrenner Ofenbauges). Brit. 383,103, Jan. 5, 1931. Mech. details.

**Rotary-drum furnace for roasting, sintering and agglomerating ores and for burning lime, dolomite, cement, etc.** FELLNER AND ZIEGLER A.-G. and BERNHARD YOUNG. Brit. 363,900, Feb. 21, 1931.

**Seal for metallurgical vacuum furnace and other large vacuum vessels.** HERAEUS-VACUUMSCHMELZE A.-G. and WILHELM ROHN. Ger. 568,097, Jan. 19, 1928.

**Charging apparatus for blast furnaces.** KARL F. JUENGLING. U. S. 1,891,821, Dec. 20. Mech. features.

**Apparatus for charging metal-heating furnaces.** JEROME R. GEORGE (to Morgan Construction Co.). U. S. 1,891,531, Dec. 20. Structural and mech. features.

**Gas-heated regenerative tunnel furnace for annealing sheet metal, etc.** HEINRICH KOPPERS. Ger. 568,300, Aug. 20, 1926.

**Reversible regenerative open-hearth furnace.** THE WELLMAN SMITH OWEN ENGINEERING CORPORATION, LTD., and HENRY W. SOWARD. Brit. 364,303, Dec. 12, 1930.

**Furnace for melting or heating iron, etc.** H. W. SOWARD and THE WELLMAN SMITH OWEN ENGINEERING CORP., LTD. Ger. 565,415, Mar. 15, 1931. This corresponds to Brit. 349,745 (*C. A.* **27**, 939) and 364,303 (preceding abstr.).

**Construction of detinning furnaces.** LEEDS DETINNING, LTD., and F. CALVERT. Brit. 383,669, Aug. 21, 1931. Mech. details.

**Producing castings of metal with tapped holes therein.** RALPH V. BURDICK and LOUIS R. KRUG (to Burdick & Son). U. S. 1,891,867, Dec. 20. Various details of app. and operation are described.

**Casting metals.** SVEN G. E. FORNANDER. Fr. 739,258, June 29, 1932. Construction of casting shell is described.

**Casting rods of metal, artificial resin, etc.** F. RASCHIG G. M. B. H. Brit. 365,329, Jan. 30, 1930. A series of rods of metal, etc., are cast simultaneously by using a battery of open-ended molds.

**Casting ingots.** BYRON E. ELDRED and HOMER C. SNOOK (Eldred to Snook). U. S. 1,892,044, Dec. 27. For casting elongated steel ingots suitable for rolling, an upright cast-iron mold is used which is lined with insulating refractory material, and the mold is charged with liquid steel hot enough to insure initial "super-molten" temp. for all of the liquid metal and for the top and side walls of the insulating lining of the mold; the lower end of the liquid metal is cooled so as to form a solid layer having a substantially horizontal top; thereafter solidification is caused to progress upwardly in a substantially horizontal plane by abstracting heat from the liquid metal downwardly and substantially uniformly. App. is described.

**Ingot molds.** K. K. NIHON SEIKOSHO. Brit. 381,742, July 16, 1931. Structural features.

**Modifying injurious strains in metal castings and forgings.** FREDERICK C. LANGENBERG (to U. S. Pipe & Foundry Co.). U. S. 1,891,234, Dec. 20. After ascertaining experimentally a degree of pressure which will advantageously modify internal strains existing in metal articles, the articles are then subjected to such detd. and known high pressure simultaneously exerted on all parts of the body to modify internal strains without materially changing the form of the body. App. is described suitable for exerting pressure on articles by means of liquid.

**Apparatus for production of metal billets, bars, etc., directly from molten metal.** FRANK W. HARBORD and VERNON HARBORD. U. S. 1,891,813, Dec. 20. Structural and mech. features.

**Making metal fabrics.** J. R. BUCHANAN and T. M. CRAY. Brit. 381,152, Apr. 22, 1931. Mechanism for joining the ends of paper machine or other woven wire fabrics by soldering, brazing or welding.

**Making wire fabrics.** J. R. BUCHANAN and T. M. CRAY. Brit. 381,169, Feb. 9, 1931. Cf. Brit. 381,152 (preceding abstr.).

**Uniting or dividing by fusion.** M. ZACK. Brit. 381,108, Apr. 17, 1931. In elec arc welding or cutting 2 electrodes are used, one for heating and the other (of metal) for adding material. The metal electrode may contain a catalyzer to serve in the decompn. of the water or steam.

**Standard comparison specimens for determination of surface texture or granulation of metals.** A. M. ERICHSEN. Brit. 351,350, Oct. 9, 1929. Various details of manuf. and mounting of comparison standards are described.

**Testing the deep-drawing qualities of sheet metals.** ERICH SIEBEL (to Steel City Testing Laboratory). U. S. 1,892,013, Dec. 27. Various details of app. and operation are described, relating to subjection of a sample of the metal to a drawing test.

**Apparatus for case-hardening iron by cementation liquids.** Soc. J. AICHELIN. Fr. 739,143, June 27, 1932. The liquid is atomized to a mist with the gas aiding cementation.

**Pickling ferrous metals.** JAMES R. MCELHANEY (to American Sheet and Tin Plate Co.). U. S. 1,892,312, Dec. 27. Before introducing the metal to be pickled into the acid pickling soln. it is immersed in water heated to about 65–100° in order to loosen scale and facilitate pickling.

**Purifying spent metal-pickling liquor.** OHIO SANITARY ENGINEERING CORP. Brit. 365,981, July 24, 1931. See Fr. 721,538 (*C. A.* **26**, 4024).

**Piston for internal-combustion engine.** SIEMENS & HALSKE A.-G. Brit. 363,809, Dec. 11, 1930. At least the head of the piston is made from a common tempered Be

alloy, especially Cu-Be alloys contg. up to 13% Be, and a powd. solid, *e. g.*, a salt such as $KNO_3$, convertible into liquid without volatilization at approx. the working temp. of the piston, is placed in a space adjacent to the head to facilitate cooling thereof.

**Ductile vanadium deposits on bodies such as tungsten wire.** ANTON E. VAN ARKEL, JAN HENDRIK DE BOER and WILHELMUS KOOPMAN (to N. V. Philips' Gloeilampenfabrieken). U. S. 1,891,124, Dec. 13. For effecting deposition of pure ductile V on a solid body enclosed in a vessel such as one of quartz, an auxiliary body is heated in an atm. contg. a V iodide to approx. 1100° to produce a V ppt., and the latter together with pure I is introduced into the vessel to reform V iodide from which V is then deposited on the body under treatment which is heated to incandescence.

**Zinc sheets.** BERNDORFER METALLWARENFABRIK ARTHUR KRUPP A.-G. Brit. 363,962, June 12, 1930. Long Zn strips or sheets are formed by casting vertical blocks, if desired, cutting off the impure top and (or) bottom portions, shaping in a rod press at over 100° to form rods or other shapes, and rolling the rods cold or hot.

**Steel.** GEBR. BÖHLER & Co. A.-G. Austrian 130,917, Nov. 15, 1930. Steel resistant to corrosion and high temp. contains 1–20% of Ta. A typical product contains C 0.2, Si 1, Cr 19 and Ta 8%.

**Refining steel, etc.** PAUL GIROD. Fr. 738,493, June 10, 1932. Impure steel, Fe or cast Fe, particularly Thomas steel, is poured along with a molten slag into a ladle to purify the metal. C, Si, Fe-Si, Al, Si-Al or Fe-Mn may be added to the slag for deoxidation of the Fe. The slag is afterward poured off along with the impurities.

**Coloring steel.** POLDIHÜTTE. Austrian 131,106, July 15, 1932. Articles of rustless steel, particularly Cr steel, are colored brown by treatment with an acidified warm aq. soln. of $Na_2S_2O_3$, $Na_2S_2O_4$ or an alkali di- or poly-thionate. Suitable solns. are prepd. by adding 10–200 cc. of $H_2SO_4$ (sp. gr. 1.4) or concd. HCl to a soln. of 50–500 g. of $Na_2S_2O_3$ in 1 l. of water. The articles may be pretreated with an acidified aq. soln. of a heavy metal chloride.

**Thermal treatment of steel.** HANS MEYER. Ger. 568,212, Dec. 7, 1926. See Brit. 281,621 (*C. A.* **22**, 3388).

**Alloy.** ERWIN F. LOWRY (to The Canadian Westinghouse Co., Ltd.). Can. 329,799, Jan. 31, 1933. An improved alloy of Ni-Co base having high mech., elec. and oxidation resistance consists of Ni 40–85%, Co 40–10%, their sum being about 80–95%, and the rest approx. 20–5% Fe plus Ti, the Ti ranging from about 10–1% of the total alloy.

**Alloy for brake drum liner.** EDWIN WALKER and HAROLD WOLSTENHOLME. Brit. 360,772, Feb. 19, 1931. Addn. to 326,276. An Fe alloy free from Cr and contg. Ni 0.5–30%, C 3–3.75, Si 1–2.5 and Mn 0.4–1 is emloyed.

**Alloy for making bearings.** ROLLS-ROYCE, LTD. Ger. 568,268, Dec. 18, 1930. See Brit. 336,881 (*C. A.* **25**, 1793).

**Alloy for making bearings, etc.** SIEGMUND DEICHES. Austrian 130,903, Apr. 15, 1931. The alloy contains Sn 9–11, Sb 9–11, Cd 1.4–1.8, As 0.9–1.7, and Cu 1.2–1.6%, the remainder being Pb.

**Aluminum and its alloys.** VEREINIGTE ALUMINIUM-WERKE A.-G. (Hans Röhrig, inventor). Ger. 561,173, May 24, 1929. Crystals of Al, deposited from a melt of impure Al, are freed from adherent melt by agitation with a fused salt mixt. of appropriate m. p. and sp. gr., *e. g.*, a mixt. of halides of Ba and Ca with KCl or NaCl. Deposited mixed crystals of Al alloy may be similarly treated.

**Treatment of aluminum alloys.** VEREINIGTE ALUMINIUM-WERKE A.-G. (Hans Röhrig, inventor). Ger. 561,293, June 29, 1928. Cast Al alloys are heated for some days at the usual annealing temp., *e. g.*, 500°, then cooled to a temp. from 30° to 175° below the annealing temp. and finally chilled. The products have a higher coeff. of expansion than those annealed by the usual methods. Cf. *C. A.* **27**, 263.

**Wrought articles of aluminum alloys.** NORMAN B. LANE and WM. T. ENNOR (to Aluminum Co. of America). U. S. 1,891,549, Dec. 20. Wrought articles such as Al alloy rivets are improved by deforming the metal by a series of metal-working operations and immersing the partially formed article in a caustic soln. such as a hot 10% soln. of NaOH prior to the final working operation.

**Copper alloy containing also cadmium and silver.** WM. H. BASSETT, JR., and ROBERT H. LEACH (to Anaconda Wire & Cable Co.). U. S. 1,891,495, Dec. 20. An alloy which is suitable for trolley wires and lead-in wires contains Cu together with Cd 0.25–1% and Ag 0.125–0.75%.

**Iron alloys containing chromium, copper, etc.** JOHN L. COX and FRANCIS B. FOLEY. U. S. 1,892,384, Dec. 27. Alloys highly resistant to $H_2SO_4$ and of "fair resistance" to HCl are formed of Fe together with Cr 20–25, Cu 10–15, Ni 1–4, Si 2–8%.

**Iron-chromium-nickel alloy.** FREDERICK M. BECKET (to The Electro Metallurgical Co. of Canada, Ltd.). Can. 329,831, Jan. 31, 1933. High-carbon ferrochrome is melted

with CaO and Ni mat and the mixt. heated until the S is substantially eliminated and an alloy contg. at least 1.0% of C is formed. The ratio of Cr to C is raised to a value suitable for stainless steel by blowing the metal, in the molten state, with com. pure O. The alloy is dild. with Fe at any stage after the elimination of the S.

**Iron-cobalt-chromium alloys.** KINZOKUZAIRYO KENKYUSHO (Hakaru Masumoto, inventor). Fr. 738,906, June 21, 1932. An alloy of low coeff. of thermal expansion contains Co 25–94, Cr 1–25% and Fe the rest, *e. g.*, Fe 36.5, Co 54 and Cr 9.5%.

**Cobalt-tungsten alloys.** VEREINIGTE STAHLWERKE A.-G. (Werner Köster, inventor). Ger. 568,099, July 5, 1930. See Fr. 713,428 (*C. A.* **26**, 1570).

**Lead alloys.** WILFORD J. HAWKINS (to American Machine & Foundry Co.). U. S. 1,892,273, Dec. 27. An alloy which may be used as a *solder* comprises Pb with about 0.1% of Pb phosphide and about 1% of a "brightening metal" such as Al, Sb, Sn or Zn.

**Corrosion-resistant steel alloy.** H. ALTON MITCHELL, ALFRED W. GREGG and RAYMOND H. FRANK (to Bonney-Floyd Co.). U. S. 1,892,316, Dec. 27. An alloy contains C 0.5, Mn 14, Al 11 and Si 0.5%, the balance being mainly Fe with incidental impurities such as S and P. Cr, Ni or Mo 1–5% also may be added. Cf. *C. A.* **27**, 57.

**Cleaning metal strip.** IMPERIAL CHEMICAL INDUSTRIES, LTD., and WM. H. SMITH. Brit. 367,437, Nov. 20, 1930. Metal strip is cleaned by passing it in a sloping path while the upper surface is treated with a shower of a volatile solvent and the lower surface is washed with solvent collected from the shower. App. is described.

**Coating metals.** WILHELM KUNST. Brit. 367,387, Jan. 4, 1930. See Fr. 705,967 (*C. A.* **26**, 76).

**Coating by dipping.** ALBERT C. LENG and ARNOLD S. LENG (trading as C. H Leng & Sons). Brit. 367,108, Jan. 7, 1931. In coating by dipping the rate of sepn. of the frame, to which the articles are attached, and the bath contg. the liquid is controlled by regulating the flow of a liquid other than the coating liquid. App. is described.

**Protecting boiler tubes, heating coils, etc., from corrosion by water or steam.** BERTHOLD BLOCK. Ger. 568,375, Feb. 26, 1930. The parts to be protected are heated in siliceous water until they acquire a thin adherent layer of silicate.

**Removing rust and scale from the interior of closed piping systems such as water pipes of buildings.** FRANCIS C. BATTISTELLA (to Sanitation Holding Corp.). U. S 1,892,093, Dec. 27. A weak acid soln. capable of attacking the rust and scale is circulated under pressure through the piping system together with an inhibitor for preventing attack of the metal walls, solids are filtered from the acid soln. under pressure, and the filtered soln. is recirculated. Various examples are given.

**Welding.** SOCIÉTÉ ANON. DES ATELIERS DE SECHERON. Brit. 363,921, Mar. 26, 1930. In a process of metallic arc welding, the coating of the electrode contains besides a mixt. of substances which react exothermally, *e. g.*, a thermoaluminic mixt., substances which under the heat of the arc evolve gases to blow the products of the reaction away from the joint. The gas-producing substances may be carbonates or hydrated substances or hydroxides.

**Apparatus for electric welding.** ALEXANDER CHURCHWARD (to Wilson Welder & Metals Co., Inc.). Brit. 363,926, Apr. 17, 1930.

**Welding electrodes or rods.** GERALD R. BROPHY (to The British Thomson-Houston Co. Ltd.). Brit. 363,784, Nov. 13, 1930. Welding rods, usable as electrodes in elec. welding, comprise an Fe alloy contg. less than 0.05% C, 2–4% Mn and up to 1% Si or Ti.

**Welding rods or electrodes.** THE QUASI-ARC CO., LTD., and ARTHUR P. STROHMENGER. Brit. 363,815, Dec. 12, 1930. The rod or electrode has a metal core surrounded by a flux coating together with one or more carbohydrates, *e. g.*, starch, cellulose, and one or more compds. which are normally stable but evolve O on heating, *e. g.*, K or Na dichromate, a perchlorate or nitrate.

**Welded tubes from hot billets.** AIR REDUCTION CO., INC. Brit. 363,790, Nov. 17, 1930. A billet from a furnace is rolled to sheet in a mill and while hot is bent into a tube and the seam fusion welded. App. is described.

**Spot welding.** R. D. BELL. Brit. 382,055, Oct. 16, 1931. Elec. app. for spot-welding small articles of stainless steel, etc.

**Elongated electric arcs suitable for use in welding operations, etc.** ENGELBERT WIST. U. S. 1,892,325, Dec. 27. An app. is described comprising an electrode of metal and a second electrode of carbon, one of the electrodes being tubular and the other rod-shaped, concentrically placed so that when an arc is struck between the electrodes a blast of gaseous hydrocarbon material may be passed along the electrodes in the channel between them and serve to elongate the arc in the direction of the blast, the

gaseous hydrocarbon serving to renew the carbon electrode without affecting the metal electrode.

**Welding wire.** LEOPOLD HASENÖHRL. Austrian 131,094, July 15, 1932. Steel wire for electric or gas-welding contains up to 0.1% of B, together with a high content of C or non-ferrous metal.

**Solder for aluminum.** FRIEDRICH STRASSER. Fr. 739,035, June 24, 1932. The solder contains Zn, Sn and up to 20% of Ag as essential ingredients, *e. g.*, Al 30, Zn 20, Sn 15, Cu 5, Bi 10 and Ag 10 parts by wt. Cf. *C. A.* **27**, 947.

**Soldering wire-cloth ends.** R. FRANCK. Brit. 381,447, Feb. 16, 1932. Details are given.

## 10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

**Celebration of the centenary of the birth of Charles Friedel. Note on his life and on a part of his work in organic chemistry.** A. BÉHAL. *Bull. soc. chim.* **51**, 1423–1511 (1932). G. G.

**The reform of chemical nomenclature. XXIII. Ketones and quinones.** G. SIBONI. *Boll. chim. farm.* **71**, 761–3(1932); cf. *C. A.* **27**, 494. **XXIV. Simple aliphatic compounds.** *Ibid* 805–6. **XXV. Glycerol and its derivatives.** *Ibid* 925–6. LEWIS W. BUTZ

**Action of water vapor on hexane and benzene.** C. MATIGNON AND M. SÉON. *Compt. rend.* **196**, 77–9(1933). - By repeated passage of a mixt. of hexane and $H_2O$ vapor over zircon at 1050° the reaction $C_6H_{14} + 12H_2O = 6CO_2 + 19H_2$ can be made practically complete. Benzene acts in the same way. Free C is not deposited unless the zircon contains Fe. ALFRED HOFFMAN

**Fractional recovery of intermediate hydrocarbons.** F. N. VORONOV. *Sinteticheskii Kauchuk* **1**, 7 12(1932).—Adsorption of the fraction b. —103.8° to 2.5° (contg. butylene, butadiene and propylene) by activated C was studied. A method for the quant. analysis of butadiene in gas with the interferometer and activated C is described. JAMES SORREL

**1,6-Dimethyl-1,3,5-hexatriene.** URION. *Compt. rend.* **196**, 353–4(1933).—By the catalytic decompn. of dipropenylglycol with reduced Cu, there is obtained, together with an impure isomer b. 137–43°, *1,6-dimethyl-1,3,5-hexatriene* (I), b. 144–8°, m. 52.5°, $d_4^{23}$ 0.7961, $n_D^{27}$ 1.5131. *Hexabromide*, m. 122°. I, freshly prepd., consists of white plates of pronounced odor. Exposed to the air for a few days it is oxidized to a yellow rubber-like resin, which gives an aldehyde reaction. ALFRED HOFFMAN

**1-Propyl-2-iodoacetylene.** THOMAS H. VAUGHN. *J. Am. Chem. Soc.* **55**, 1293 (1933).—PrC : CI as prepd. by Grignard and Perrichon (*C. A.* **20**, 1782) is probably impure A sample prepd. by V. $b_{35}$ 67–7.5°, $b_{51}$ 75–7°, $\gamma_{25}$ 34.22 dynes/cm., [*P*] 283.3 (calcd. 281.3), $d_{25}$ 1.6557, $n_D^{25}$ 1.5310, $n_D^{25}$ 1.52231. C. J. WEST

**Polymerization of some unsaturated hydrocarbons. The catalytic action of aluminum chloride.** W. H. HUNTER AND R. V. YOHE. *J. Am. Chem. Soc.* **55**, 1248–52 (1933).—At room temp. there is very little reaction between CH : CH and $AlCl_3$; at 100° adsorption and reaction were very rapid. There were no liquid reaction products; analysis of the darkened catalyst indicated the compd. $AlCl_3.C_2H_2$. The presence of $Et_2O$ vapor caused an immediate darkening of the catalyst and liquid products resulted; however, there was no reaction between $AlCl_3.Et_2O$ and $C_2H_2$ at room temp. or at 100°. If $C_2H_2$ is bubbled through $Et_2O$ and then passed over $AlCl_3$ an extremely exothermic reaction takes place and liquid products are formed which decomp. violently with $H_2O$ to give HCl and a dark brown cuprene-like material; analysis suggests $Al_2Cl_6.Et_2O.C_2H_2$. $Al_2Cl_6.2PhNMe_2$ failed to catalyze the polymerization of $C_2H_2$ at room temp. or at 100°. $Me_3N$ completely stopped the adsorption of $C_2H_2$ by $AlCl_3$ at 100°. $C_2H_4$ is adsorbed slowly by anhyd. $AlCl_3$ to give a very small quantity of a deep red oil; neither heat nor $Et_2O$ vapor accelerated the reaction; the $Et_2O$- or $PhNMe_2$-$AlCl_3$ complex caused no reaction between $C_2H_4$ and $AlCl_3$. Isobutylene (I) was extremely reactive toward $AlCl_3$; liquid products formed immediately when I was allowed to come into contact with $AlCl_3$, giving a colorless liquid, mol. wt. 200, Br no. 10–15, and a red oil, contg. 11.5% Al; I contg. $Et_2O$ vapor reacts vigorously with $AlCl_3$ to give a red viscous oil with 11.8–12.3% Al; $Al_2Cl_6.2PhNMe_2$ does not react with I at room temp.; at 140° the color of the complex changed from pale green to cherry-red but its compn. remained unchanged; the complex $Al_2Cl_6.PhNMe_2$ gives a colorless liquid and the complex changes until it becomes inactive, at which point it contains 10.48% Al and 2.63% N ($Al_2Cl_6.PhNMe_2.2C_4H_8$). A theory of polymerization based on the electronic structures of $AlCl_3$ and olefins is postulated. C. J. WEST

**Acetylene polymers and their derivatives. VI. Vinylethinylmagnesium bromide and some of its reactions.** WALLACE H. CAROTHERS AND GERARD J. BERCHET. *J. Am. Chem. Soc.* 55, 1094–6(1933); cf. *C. A.* 27, 1321.—$CH_2$:CHC:CH reacts with EtMgBr, yielding $CH_2$:CHC:CMgBr (I). I with $Me_2CO$ gives 53% of *vinylethinyldimethylcarbinol*, $b_{24}$ 67°, $n^{20}_D$ 1.4778, $d^{20}_4$ 0.8872; in 2 weeks it becomes a hard, tough, transparent mass, the transformation being accompanied by absorption of O; catalytic reduction gives $Me_2BuCOH$. I and $CO_2$ give *vinylpropiolic acid* (II), $b_2$ 64–71°, turns yellow on standing and yields a rubber-like yellow substance on heating 85 min. at 75° *in vacuo*. I and $\alpha$-$C_{10}H_7NCO$ give the *α-naphthylamide* of II, yellow, m. 125–6°. $Ph_3$-CCl and I give *vinylethinyltriphenylmethane*, yellow, m. 134–5°. **VII. Sodium vinylacetylide and vinylethinylcarbinols.** W. H. CAROTHERS AND RALPH A. JACOBSON. *Ibid* 1097–1101.—Na vinylacetylide, obtained by the action of Na or of $NaNH_2$ on $CH_2$:CHCH:CH, is a very reactive white powder, which shows a tendency to ignite spontaneously in the air. Under properly controlled conditions it is a convenient reagent for introducing the vinylethinyl group into reactive org. compds. Vinylethinylcarbinols are readily obtained by treating a mixt. of vinylacetylene and a ketone; $NaNH_2$. The same methods can also be applied to aldehydes but with less fav results. The tert. carbinols all polymerize spontaneously on standing, giving a sirup, then a tough rather elastic mass and finally a hard, transparent glass-like; the sec. carbinols polymerize much less slowly. The following *vinylethinylcarbinol* described: *Me*, $b_{22}$ 65°, $d^{20}_4$ 0.9112, $n^{20}_D$ 1.4851; *Bu*, $b_{10}$ 74–6°, d. 0.8919, *n* 1.47 *Me Et*, $b_{20}$ 75°, d. 0.8878, *n* 1.4802; *di-Et*, $b_4$ 62°, d. 0.8875, *n* 1.4800; *di-Pr*, $b_{22}$ d. 0.8738, *n* 1.4745; *Me octyl*, $b_5$ 98–100°, d. 0.8681, *n* 1.4734; *cyclopentyl*, $b_7$ 104–5° d. 1.0181, *n* 1.5228; *cyclohexyl*, $b_3$ 84–5°, d. 0.9742, *n* 1.5169; *Me Ph*, $b_4$ 125–6°, m. 40–1° Distn. of these carbinols at too high a temp. leads to the production of the corresponding substituted divinyl acetylenes. C. J. WEST

**Action of bromine and butadiene.** G. B. HEISIG. *J. Am. Chem. Soc.* 55, 1297 (1933).—On mixing gaseous butadiene and Br in the ratio of 1–1 or 1–0.5 with from 15–20 vols. N a reaction occurs, giving 1,1-dibromo-2-butene, m. 53°; on carrying out the reaction in the same bulb which had been coated with paraffin, the rate of the reaction was very markedly reduced; since no fog or smoke formed in the uncoated reaction sphere, the reaction must have occurred on the surface. C. J. WEST

**Hydrolysis and rearrangement of certain olefin dibromides containing a tertiary bromine.** W. L. EVERS, H. S. ROTHROCK, H. M. WOODBURN, E. E. STAHLY AND F. C. WHITMORE. *J. Am. Chem. Soc.* 55, 1136–40(1933).—The hydrolysis and rearrangement of isobutylene and trimethylethylene dibromides are practical methods of converting *tert*-BuOH and *tert*-AmOH to iso-PrCHO and iso-PrAc in good yields. The hydrolysis of 13 other dibromides prepd. from aliphatic tert. alcs has been studied; with 7 of these the rearranged aldehyde or ketone has been obtained in poor yield; with the others, polymerizations occur apparently due to the formation of substituted butadienes and other unsatd. products. 2,3-Dibromo-2-methylpentane, $b_{15}$ 66–8°, $n^{20}_D$ 1.4975, gives 25% of $EtCOCHMe_2$; 2,3-dibromo-2-methylhexane, $b_6$ 75–8°, *n* 1.5024, gives 33% of iso-PrCOPr; 2,3-dibromo-3-methylpentane, $b_5$ 48–50°, $b_{15}$ 72–4°, *n* 1.5085, gives 20% of *sec*-BuAc; 2,3-dibromo-3-ethylpentane, $b_4$ 73–7°, *n* 1.5098, gives 30% 3-ethylpenta-1,3-diene and 10% of 3-ethylpentan-2-one; 2,3-dibromo-2,3-dimethylpentane gives 10% of *tert*-AmAc. C. J. WEST

**Preparation of vinyl iodide.** JOHN SPENCE. *J. Am. Chem. Soc.* 55, 1290–1(1933).—$C_2H_4I_2$ (282 g.) and 334 cc. 3 *N* EtONa, on distn., give approx. 50 g. $CH_2$:CHI, b. 56–6.5°, $d^{20}$ 2.037, *n* 1.53232, 1.53845. 1.55186, 1.56468 for *α*, D, *β* and *γ*. C. J. WEST

**Dehydration of 2,2-dimethylhexan-1-ol and related tertiary alcohols.** FRANK C. WHITMORE AND J. M. CHURCH. *J. Am. Chem. Soc.* 55, 1119–24(1933).—$Me_2BuCCH_2$-OH, $b_{14}$ 80–2°, $n^{20}_D$ 1.4304, heated with 6% of its wt. of concd. $H_2SO_4$ and 4% of *p*-$MeC_6H_4SO_3H$ for 6 hrs. with const. removal of the products by distn., gave 70% dehydration with a 63% yield of octylenes. Indication of the formation of $Me_2C$:CHBu (I), $CH_2$:CMeAm (II), PrCH:CMeEt (III) and MeBuC:CHMe (IV) was obtained from the ozonolysis products; the 1st 2 appeared in the ratio of 12:1, the last 2 in the ratio of 2:1. Since the first of these ratios was much higher than similar ratios obtained in dehydrating various alcs. contg. Me and Am groups, it was decided to dehydrate the tert. alcs. $Me_2AmCOH$ and MeEtBuCOH. The first gave I and II in the ratio of 1.4:1 and the 2nd IV and III in the ratio 1.6:1 and also a 6% yield of $CH_2$:CEtBu. The difference between the values of 12:1 and 1.4:1 for the ratios of I and II formed by dehydration with rearrangement of the primary alc. by means of a small quantity of concd. $H_2SO_4$ and by dehydration of the tert. alcs. by means of a small quantity of 50% $H_2SO_4$ is being studied. C. J. WEST

**Rearrangement of *tert*-butylmethylcarbinol[pinacolyl alcohol]. I.** FRANK C. WHITMORE AND H. S. ROTHROCK. *J. Am. Chem. Soc.* 55, 1100–9(1933).—Pinacolyl

alc. (I) has a f.-p. const. of 5.6; heating in $CO_2$ atm. at 200° for 18 hrs. causes little change, as did refluxing 41 hrs. The acetate, $b_{740}$ 141.2–1.4°; heating 5 g. at 160–70° for 144 hrs. gives 3 g. unchanged alc. Distn. over porous tile at 300° gave 35% of *tert*-BuCH:$CH_2$. The chloride and bromide from I consist almost entirely of rearranged products. The compn. of the impure bromide was not changed by heating 16 hrs. at 125°; hydrolysis expts. indicated that the mixt. was about 90% tert. bromide, $Me_2CBr$-$CHMe_2$. A variety of means of dehydration of I gave only $Me_2C$:$CMe_2$ and Me-($Me_2CH$)C:$CH_2$ without any 3rd product. Attempts to dehydrate boiling I by means of traces of $PhSO_3H$ and I failed. C. J. West

**Hydrogenolysis of alcohols to hydrocarbons.** Bruno Wojcik and Homer Adkins. *J. Am. Chem. Soc.* **55**, 1293–4(1933).—Hydrogenolysis of primary alcs. (5 hrs. at 250° and 100–200 atms. H over a Ni catalyst) gives the next lower hydrocarbon; there have been prepd. in this way undecane, tridecane, heptadecane and ethylcyclohexane; decan-1,10-diol gives octane. Sec. alcs. react according to the equation $R_2CHOH + H_2 = R_2CH_2 + H_2O$; cyclohexanol and 2-octanol give cyclohexane and octane. $Me(CH_2)_5$-$CH(OH)(CH_2)_{10}CH_2OH$ gave $C_{17}H_{36}$. The 2 reactions, ester to alc. and alc. to hydrocarbon, can be carried out in 1 step by using a mixt. of Cu-Cr oxide and Ni but the operation is best carried out in 2 stages, since the $H_2O$ formed in the 2nd step prevents the completion of the 1st reaction. C. J. West

**Carbon monoxide and hydrogen.** Fritz Rosendahl. *Montan. Rundschau* **25**, 1–14; *Petroleum Z.* **29**, No. 6, 1–14(1933).—A detailed historical review of the catalytic prepn. of MeOH, hydrocarbons, etc., from CO and $H_2$ under high temp. and pressure. Alfred Hoffman

**Preparation and properties of methylene dibutyl disulfone.** R. E. Stutz and R. L. Shriner. *J. Am. Chem. Soc.* **55**, 1242–5(1933).—BuBr and $Na_2S_2O_3$ in $H_2O$ give 47% of $Bu_2S_2$, $b_{760}$ 226°, $d_{20}^{20}$ 0.944, $n_D^{20}$ 54.90. BuSNa and $CH_2I_2$, refluxed for 3 hrs., give 82% of *methylene dibutyl disulfide*, $b_{30-5}$, 133–8°, $b_{760}$ 250°, $d_{20}^{20}$ 0.947, $n_D^{20}$ 1.4946; the *disulfone* (I) m. 95–6° (13% yield with $CrO_3$ in AcOH); I and Br in $H_2O$, heated 2 hrs., give a *di-Br deriv.*, m. 80° (47%). I with MeI in EtONa gives the *di-Me deriv.*, m. 54–7° (40%). Na or Na-K alloy cleaves alkyl and aryl disulfides to the metal mercaptides; $Bu_2S_2$ and $Ph_2S_2$ were studied. C. J. West

**Preparation of some higher aliphatic sulfonic acids.** C. R. Noller and J. J. Gordon. *J. Am. Chem. Soc.* **55**, 1090–4(1933).—The following *mercaptans* were the starting points for the synthesis of the sulfonic acids: nonyl, $b_{20}$ 100–4°, $d_{20}^{20}$ 0.8386, $n_D^{20}$ 1.45197; decyl, $b_{19}$ 125–7°, d. 0.8410, *n* 1.45367; *undecyl*, $b_{21}$ 138–41°, d. 0.8432, *n* 1.45816; *lauryl*, $b_{24}$ 153–5°, d. 0.8450, *n* 1.45886; *tridecyl*, $b_{22}$ 162–6°, d. 0.8468, *n* 1.45906; *myristyl*, $b_{22}$ 176–80°, d. 0.8484, *n* 1.46005. Oxidation of the Pb mercaptides with 50% $HNO_3$ gives the Pb sulfonates; the free sulfonic acids were obtained by passing HCl into the suspension in iso-PrOH; m. ps. are given for the monohydrate and the anhyd. acid: *undecyl*, 40–1°, 49°; *lauryl*, 43–5°, 52°; *tridecyl*, 48–9°, 58°; *myristyl*, 55–6°, 65.5°; the *benzylaniline salts* m. as follows: *nonyl*, 90.5–1.0°; *decyl*, 84–4.5°; *undecyl*, 84.6–4.7°; *tridecyl*, 87.5–8°; *myristyl*, 82.5–2.7°. C. J. West

**Amination by ammonolysis. IV. Design and construction of equipment.** P. H. Groggins. *Ind. Eng. Chem.* **25**, 274–7(1933); cf. *C. A.* **27**, 1344.—Because of the elevated temps. at which the reaction between org. compds., contg. replaceable substituents, and $NH_3$ generally takes place, it is essential that ammonolysis be carried out either in high-pressure autoclaves (discontinuous) or in tubular systems (continuous). Direct-fired systems have been supplanted by jacketed vessels heated with steam or circulated fluid or by tubular systems immersed in molten alloys. Such systems provide a safer, more accurate and practically automatic control of the amination process. **V. Control of ammonia recovery system.** *Ibid* 277–9.—The successful industrial use of amination processes demands the recovery of the excess aq. $NH_3$ and its return to the reaction system at a const. and optimum strength. Problems involved in the recovery of $NH_3$ are (1) removal of the heat of soln., and (2) controlling the soly. by regulating the temp., pressure and concn. of the aq. $NH_3$ in the absorption system. In properly conducted operations, the recovery is efficiently and almost automatically carried out by the choice of suitable equipment and the installation of mechanically controlled devices. W. C. Fernelius

**Reactions of ethylene oxide. I. Action of ethylene oxide on diethylamine.** A. J. W. Headlee, A. R. Collett and C. L. Lazzell. *J. Am. Chem. Soc.* **55**, 1066–9(1933); cf. Horne and Shriner, *C. A.* **26**, 4303.—$Et_2NH$ and $(CH_2)_2O$ in a Cu autoclave at 100° for 1 hr. give 81% $Et_2NCH_2CH_2OH$ (I), $b_{741}$ 160°, $n_D^{25}$ 1.4389, $d_{abs.}^{25}$ 0.8800, $\eta^{25}$ 0.0405, $\gamma^{26.5}$ 27.50. $(CH_2)_2O$ reacts with MeOH at 55°, contrary to H. and S. The corresponding phys. consts. for I and other compds. prepd. by H. and S. are given, since they do not agree with those in this paper. I and $(CH_2)_2O$ on autoclaving give $Et_2NCH_2CH_2OCH_2$-

$CH_2OH$, $b_{46}$ 135°, $n$ 1.4464, d. 0.9421, $\eta$ 0.0856, $\gamma$ 30.50; *p-nitrobensoate*, m. 128.5°. Further action of $(CH_2)_2O$ gave the following compds.: $Et_2N(CH_2CH_2O)_2CH_2CH_2OH$, $b_{30}$ 163–5°, $n$ 1.4501, d. 0.9753, $\eta$ 0.1284, $\gamma$ 31.26. $Et_2N(CH_2CH_2O)_3CH_2CH_2OH$, $b_{33}$ 185–8°, $n$ 1.4529, d. 0.9905, $\eta$ 0.1596, $\gamma$ 32.05. $Et_2N(CH_2CH_2O)_4CH_2CH_2OH$, $b_9$ 182–4°, $n$ 1.4566, d. 1.0128, $\gamma$ 33.47. $Et_2N(CH_2CH_2O)_5CH_2CH_2OH$, $b_{36}$ 254–9°, $n$ 1.4592, d. 1.0325, $\gamma$ 34.65. $Et_2N(CH_2CH_2O)_6CH_2CH_2OH$, $b_4$ 205–9°, $n$ 1.4620, d. 1.0474, $\gamma$ 35.51. C. J. WEST

**Cyclization of a series of $\omega,\omega'$-dicarbethoxydialkylmethylamines through the acetoacetic ester condensation.** E. A. PRILL AND S. M. MCELVAIN. *J. Am. Chem. Soc.* **55**, 1233–41(1933).—Compds. of the type $EtO_2C(CH_2)_mNMe(CH_2)_nCO_2Et$, in which both $m$ and $n$ are varied from 1 to 4, have been studied. EtONa was used as a condensing agent instead of Na; no solvent, $C_6H_6$ and PhMe were used with the various diesters. The results show that EtONa is a more efficient condensing agent than Na for the formation of 1-methyl-3-carbethoxy-4-piperidone and that diln. of the reactants with an inert solvent favors the intramol. condensation. $\gamma$-$EtO_2C(CH_2)_3NMeCH_2CO_2Et$ condenses even more readily than the isomeric $NMe(CH_2CH_2CO_2Et)_2$. Amino diesters which have the necessary structure (2 H atoms on an $\alpha$-C atom) for an acetoacetic ester condensation and at the same time have an $NH_2$ group attached to this $\alpha$-C atom react very slowly, if at all, with EtONa or Na in condensations involving this particular $\alpha$-C atom. *Et $\gamma$-bromobutyrate*, in 72% yield from the nitrile, $b_{28}$ 104–5°, $d_{25}^{25}$ 1.3531, $n_D^{25}$ 1.4539. Et *$\beta$-N*-methylaminopropionate gives a *HCl salt*, m. 59–60°. *Et $\delta$-N-methylaminovalerate*, from 1-methyl-2-piperidone, was analyzed as the *HCl salt*, m. 108–9°. $\gamma,\gamma'$-Dicarbethoxydipropylamine, from $MeNH_2$ and $Br(CH_2)_3CO_2Et$, $b_9$ 159–60°, $d_{25}^{25}$ 0.9913, $n_D^{25}$ 1.4407, 20% yield. The following *amines* were prepd. from 1 mol. of an $\omega$-haloester and 2 mols. of an *$\omega$-N*-methylamino ester (allowed to stand 4–24 hrs. at room temp.) (R = $CO_2Et$): $RCH_2NMeCH_2R$, $b_{11}$ 114–5°, d. 1.0485, $n$ 1.4328, 75%; $RCH_2NMeCH_2CH_2R$, $b_{10}$ 124–5°, d. 1.0287, $n$ 1.4350, 85%; $RCH_2NMe(CH_2)_3R$, $b_{10}$ 134–5°, d. 1.0145, $n$ 1.4367, 80%; $R(CH_2)_4NMeCH_2R$, $b_9$ 146–7°, d. 1.0032, $n$ 1.4393, 73%; $R(CH_2)_4NMe(CH_2)_2R$, $b_9$ 159–60°, d. 0.9914, $n$ 1.4410, 54%; $R(CH_2)_4NMe(CH_2)_3R$, $b_9$ 166–7°, d. 0.9814, $n$ 1.4420, 58%; $R(CH_2)_4NMe(CH_2)_4R$, $b_9$ 177–8°, d. 0.9741, $n$ 1.4438, 55%. Condensation with EtONa gives *1-methyl-4-carbethoxy-3-piperidone-HCl*, m. 171–3° (decompn.); *1-methyl-4-carbethoxy-3-pyrrolidone*, m. 132–3°. *Cyclic amino ketones*, $MeN.(CH_2)_m.CO.(CH_2)_n$ were prepd. as follows: $m$ and $n$ = 2, 1, $b_{18}$ 46–7°, d. 0.9675, $n$ 1.4431 (*HCl salt*, m. 62–3°); 3, 0, $b_{14}$ 84–5°, d. 1.0260, $n$ 1.4666 (*HCl salt*, m. 79–81°); 2, 2, $b_{11}$ 56–8°, d. 0.9725, $n$ 1.4580 (HCl salt, m. 94–5°); 3, 1, $b_{18}$ 63–4°, d. 0.9684, $n$ 1.4559 (*HCl salt*, m. 110–1°); 4, 1 (*HCl salt*, m. 195–6°). With the other diesters studied, the condensation, as judged from the amt. of EtOH given off, was quite slow and incomplete and went to give intermol. condensation products. C. J. WEST

**Highly polymerized compounds. LXXIV. The Raman effect of methyl silicates.** R. SIGNER AND J. WEILER. *Helv. Chim. Acta* **16**, 115–21(1933); cf. *C. A.* **27**, 1256.—Data are given for the mono-, di-, tri- and decameric esters of Me orthosilicate and compared with those for quartz and crownglass. A curve shows the relation between the degree of polymerization and Raman frequency. C. J. WEST

**Nitrogen trichloride and Grignard reagents.** GEORGE H. COLEMAN AND MARION A. BUCHANAN. *Proc. Iowa Acad. Sci.* **38**, 168(1931).—$NCl_3$ reacts with Grignard reagents to produce primary amines, $NH_3$ and a small amt. of secondary amines. No tertiary amine was isolated. The yields of these products obtained in a typical reaction with BuMgCl were: $BuNH_2$ 35%, $NH_3$ 15% and $NHBu_2$ 3%. W. G. GAESSLER

**Organomagnesium compounds containing solubilizing amino groups.** HENRY GILMAN, STANTON A. HARRIS AND CHUAN LIU. *Proc. Iowa Acad. Sci.* **38**, 167–8(1931).—There is an uncommon demand, particularly in cancer and related studies, for organomagnesium compds. which contain amino groups to increase the soly. of the products and also endow them with certain desirable physiol. properties. With this in mind a series of Grignard reagents is being prepd., the members of which contain the —MgX group attached to C in a mol. having a basic group like $—NR_2$ or in a substituted pyridine, quinoline, etc., grouping. Such RMgX compds. are formed from the corresponding RX compds. with somewhat less ease than from RX compds. having no basic grouping; however, they appear to have the same general properties of RMgX compds. not contg. the amino or substituted amino groups. W. G. GAESSLER

**Synthesis of aliphatic $\alpha,\alpha$-dimethyl aldehydes of high molecular weight.** G. DARZENS AND ANDRÉ LEVY. *Compt. rend.* **196**, 184–7(1933); cf. *C. A.* **27**, 1323.—In order to verify a rearrangement indicated by the results of previous work monomethyl glycols of the type R'RC(OH)CH(OMe)R and especially glycols of the type $Me_2C(OH)CH(OH)R$ were prepd. and studied. If the group R is of high mol. wt. they readily rearrange into aldehydes of the type $Me_2CRCHO$, thus providing a method for prepg.

trisubstituted acetaldehydes previously obtained from decompn. of glycidic acids. When the R group is smaller than $C_5H_{11}$ this rearrangement does not take place but the expected ketone is formed. A medium-large radical yields a mixt. of aldehyde and ketone. *Method.* Reaction of an α-Br acid possessing the required radical with MeONa, then with 2 mols. MeMgBr gives good yields of monomethylglycol which is then treated at the b. p. with 2 parts by wt. of $HCO_2H$. The compds. obtained were *α,α-dimethylstearic aldehyde*, b. 165–177°, m. 14.5°; *α,α-dimethyllauric aldehyde*, $b_{13}$ 140°. The monomethylglycol from capric acid gave 30% *α,α-dimethyldecylic aldehyde* and 70% iso-Pr cetyl ketone. The glycol from enanthic acid $C_5H_{11}CH(OMe)C(OH)Me_2$ gave solely iso-PrCOAm. ANNE E. WHITE

**Autoxidation of aldehydes in the presence of manganese dioxide hydrate.** JULIUS V. BRAUN AND WERNER KELLER. *Ber.* **B66**, 215–19(1933).—The $Ag_2O$ method of oxidizing aldehydes to the corresponding acids is very inconvenient for work with large quantities of materials. In the study of the degradation of naphthenic acids (*C. A.* **26**, 2306) recourse was accordingly had to $H_2O_2$ in the presence of $Na_2CO_3$, but with no great success; the aldehydes, RCHO, form stable $H_2O_2$ addn. products which then lose water or dissoc. to form peroxides and the acid, but the changes are so slow that the unchanged $H_2O_2$ has a chance to further oxidize the residue R. The velocity with which aldehydes are oxidized by mol. $O_2$ is also too slow, even when the reaction is catalyzed with ferrous compds., but $MnO_2$, either as such in finely divided form, or, better, as $KMnO_4$, has been found to be a very efficient catalyst. The amt. of $MnO_2$ can be decreased from $^1/_{1000}$ to $^1/_{4000}$ mol. per mol. of aldehyde without perceptibly decreasing its influence; $^1/_{12,000}$ mol. is distinctly less effective and $^1/_{40,000}$ mol. seems to have no effect at all. The mechanism of the reaction is apparently the same as with ferrous salts, the $MnO_2$ adding loosely to the C:O grouping and thereby making it more readily accessible to the O. Aldehydes which readily undergo autocondensation (enanthal, decylaldehyde, but not iso-PrCHO) become more indifferent to $MnO_2$ on long standing; that it is the unsatd. autocondensation products which are responsible is shown by the fact that unsatd. aldehydes (citronellal, PhCH:CHCHO) are not catalyzed by $MnO_2$, and addn. of olefins of the most varied kind to an aldehyde-$MnO_2$ mixt. instantly slows up or stops the oxidation. *Sebacic dialdehyde*, $b_{11}$ 136–8°, m. 16–18° (*disemicarbazone*, m. 185°), is obtained in 75% yield, together with the *aldehydo acid*, $b_{12}$ 140–80°, m. 40–60° (*semicarbazone*, m. 155°), by ozonizing 1,11-dodecadiene (*C. A.* **26**, 2963) in 10% AcOH and treating the ozonide with Zn dust. C. A. R.

**Improvement of the general method for preparing aldehydes by degradation of acids.** G. DARZENS AND ANDRÉ LEVY. *Compt. rend.* **196**, 348–50(1933).—The method consists of prepg. the α-alkoxy acids from the α-Br acids and NaOR and distg. the same with Cu. *α-Methoxyenanthic acid*, $b_{15}$ 122°, gives hexanal (70%). *α-Methoxylauric acid*, m. 52°, $b_4$ 145°, gives undecanal (75%) *α-Methoxystearic acid*, m. 62.5°, $b_5$ 190°, gives margaric aldehyde in theoretical yield. ALFRED HOFFMAN

**Action of phosphorus oxychloride on some aldehydes.** M. BACKES. *Compt. rend.* **196**, 277–9(1933).—The action of $POCl_3$ on aldehydes in which the α-C atom is not completely substituted produces aldol condensation, while in aldehydes with completely substituted α-C atoms, chlorination takes place. $POCl_3$ (I) with EtCHO gives 2-methyl-3-pentanol-1-al; the 2,4-dinitrophenylhydrazone m. 161°, and a dimer $b_{17}$ 150–60°. The dimer and I give EtCH:CMeCHO. I and PrCHO give α-ethyl-β-propylacrolein and its 2,4-dinitrophenylhydrazone m. 122°. I and isobutanal give the dimer 2,2,4-trimethyl-3-pentanol-1-al and its 2,4-dinitrophenylhydrazone m. 177°. I and heptanal give 2-amyl-3-nonanol-1-al, $b_{0.5}$ 103–6°, and its 2,4-dinitrophenylhydrazone m. 124.5°. A dimer, $b_{0.5}$ 160–85°, is also obtained. JULIUS WHITE

**Synthesis of some methoxymethyl alkyl ketones and their relation to the aroma of products of fermentation.** SUTTEKITI MARUYAMA. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) **20**, 53–62(1933).—As it has been found that acetoin is a constituent of the aroma of saké, but is accompanied by other unknown odorific substances, homologs of it have been prepd. While these have a more or less agreeable odor, they do not seem characteristic of saké. The ketones were prepd. by the reaction: $MeOCH_2CN + RMgBr \longrightarrow MeOCH_2C(:NMgBr)R \longrightarrow MeOCH_2COR$. $MeOCH_2CN$ was prepd. by shaking 92 g. of $AcCH_2Cl$ with 102 g. of dry powd. CuCN at room temp. for 20 min., then carefully heating to 50° till the main reaction was over. The flask was then heated at 100° till the solid cake liquefied, then in an oil bath for 20 min. to complete the reaction. The product was then fractionated. Crude yield, 71 g. The Grignard reactions were carried out as usual. The following *methoxymethyl alkyl ketones* were prepd.: *Et*, b. 130°; *Pr*, $b_{175}$ 117°; *Bu*, $b_{173}$ 131–2°; *iso-Am*, $b_{87}$ 117°. *Semicarbazones*, m. 84–5°, 97–8°, 95°, 105–6°. *2,4-Dinitrophenylhydrazones*, m. 198–8.5°, 128.5–9°, 93°, 109.5°. ALFRED HOFFMAN

**Condensation of 2-butanone with normal aliphatic aldehydes.** S. G. POWELL,

HAZEL C. MURRAY AND MAYNARD M. BALDWIN. *J. Am. Chem. Soc.* **55**, 1153–4(1933).—2-Butanone reacts with EtCHO, BuCHO and AmCHO through the $CH_3$ group (cf. *C. A.* **19**, 239). The following new *compds.* are reported, the condensation, dehydration, reduction and oxidation being carried out as described in the previous paper. EtCH(OH)CHMeAc, $b_{20}$ 94–6°, $n_D^{25}$ 1.435, $d_4^{22}$ 0.939, 61% yield; BuCH(OH)CHMeAc, $b_{16}$ 98°, $n_D^{25}$ 1.4404, $d_4^{20}$ 0.9167; $C_6H_{13}CH(OH)CHMeAc$, $b_{22}$ 147°, $n_D^{25}$ 1.4425, $d_4^{22}$ 0.889; PrCHMeAc, b. 142–5°, $n_D^{25}$ 1.409, $d_4^{25}$ 0.828; AmCHMeAc, $b_{18}$ 64–5°, $n_D^{25}$ 1.424, $d_4^{27}$ 0.832; $C_7H_{15}CHMeAc$, $b_{20}$ 121°, $n_D^{20}$ 1.431, $d_4^{20}$ 0.823; AmCHMeCH(OH)Me, $b_{16}$ 75°, $n_D^{25}$ 1.437, $d_4^{27}$ 0.831; $C_7H_{15}CHMeCH(OH)Me$, $b_{19}$ 125°, $n_D^{25}$ 1.440, $d_4^{25}$ 0.834. It appears that the normal aliphatic aldehydes in general react in this manner with 2-butanone. C. J. WEST

**Light absorption of aliphatic carboxylic and amino acids in the presence of neutral salts.** FRANZ LEUTHARDT AND MARIANNA PFISTER. *Helv. Chim. Acta* **16**, 228–32 (1933); cf. *C. A.* **26**, 4584.—The effect of $MgCl_2$, $CaCl_2$ and NaCl upon the absorption of AcOH, $ClCH_2CO_2H$, $Cl_3CCO_2H$, $PrCO_2H$ and $H_2NCH_2CO_2H$ is shown by a series of curves. The absorption curves of the free acids (undissocd.) are unchanged by the presence of a high excess of neutral salt but those of the ionized acids are shifted toward the shorter wave lengths. The $NH_2$ acid behaves similarly. C. J. WEST

**Isomerism phenomena in the β-series of eleostearic acids.** ERNST EIGENBERGER. *J. prakt. Chem.* **136**, 75–116(1933).—An extended description is given of 4 *isomeric β-eleostearic acids*, which are characterized principally by their *K salts*. Sp. cond. data, soly. and crystallographic data are given for the salts. C. J. WEST

**Maximum rotations in the homologous series of α-bromo acids.** P. A. LEVENE. *J. Am. Chem. Soc.* **55**, 1295–6(1933).—$EtCHBrCO_2H$, resolved through the brucine salt, has $[M]_D^{25}$ 59.62°; $BuCHBrCO_2H$, resolved through the strychnine salt, has $[M]_D^{25}$ −71.45°; thus, in this homologous series the values of the rotations of the individual members increase progressively ($MeCHBrCO_2H$ has been shown to have $[M]_D^{25}$ −43.6°). The progress in the case of the Me esters was similar, being 83°, 92° and 104°, resp. C. J. WEST

**The rapid combustion of ketene.** J. A. MULLER AND ÉGLANTINE PEYTRAL. *Compt. rend.* **196**, 279–80(1933); cf. *C. A.* **26**, 1897, 4063.—By heating $CH_2CO$ 0.002–0.003 sec. by passing it rapidly through a Pt. tube at 1150° under partial pressure, M. and P. obtained $C_2H_4$, $C_2H_2$, CO, $CH_4$ and H. This is explained by the dissocn. of $CH_2CO$ into the radicals CO and $CH_2$ which can undergo reactions to produce the above. J. WHITE

**Color and structure of amides.** MME. RAMART-LUCAS AND MLLE. WOHL. *Compt rend.* **196**, 120–2(1933).—The absorption curves in the ultra-violet show that amides, non-substituted or monosubstituted, are, in liquid form or in soln., an equil. mixt. of the amide and the imino alc. ALFRED HOFFMAN

**Synthesis of vinylpropenylglycol.** WIEMANN. *Compt. rend.* **196**, 118–20(1933).—By hydrogenating 500 g. of an equimol. mixt. of acrolein and crotonaldehyde, a fraction (90 g.) is obtained, consisting of a mixt. of *stereoisomeric vinylpropenylglycols*, $b_{15}$ 114–17°, $n_{22}^D$ 1.4732, $d_{22}$ 0.9851. On hydrogenation with colloidal Pd this gives a *liquid* $C_7H_{16}O_2$, $b_{15}$ 109°, $n_{22}^D$ 1.4420, $d_{22}$ 0.9430, and a *solid isomer*, m. 103–4°, probably identical with a substance obtained by hydrogenation of ethylbutyrylcarbinol (Vénus-Danilova, *C. A.* **22**, 4473). ALFRED HOFFMAN

**The reaction of etherates of magnesium halides with ethylene oxides. II. Reactions of bromomagnesium etherate with some aliphatic and monosubstituted ethylene oxides.** I. RIBAS AND E. TAPIA. *Anales soc. espaü. fis. quím.* **30**, 778–91(1932); cf. *C. A.* **24**, 4265; **27**, 1323.—Products of the reaction of some ethylene oxides in $Et_2O$ on MgBr etherate were investigated and found to have the general formula $RCH_2BrCHOMgBr \cdot Et_2O$, where R = H, $CH_2Cl$, Me or OMe, because they were identical with those obtained by means of the corresponding bromohydrins and EtMgBr according to the reaction $RCH_2OCH_2Br + EtMgBr = C_2H_6 + RCH_2BrCHOMgBr$. If the etherate of the MgBr reacts with an excess of $(CH_2)_2O$ it forms $[RCH_2CHBrO]_2Mg$. Even at −21° no mol addn. product of MgBr and the ethylene oxides like those described by Meisenheimer (*C. A.* **20**, 3687) was formed. E. M. SYMMES

**Derivatives of dioxane.** J. BÖESEKEN, F. TELLEGEN AND P. COHEN HENRIQUEZ. *J. Am. Chem. Soc.* **55**, 1284–8(1933); cf. *C. A.* **27**, 93.—Chlorination of dichlorodioxane (I) gives a liquid asym. *tetra-Cl deriv.* and a *hexa-Cl deriv.* (II), m. 89.5–91°. Higher chlorinated products are under study. It is highly probable that by long duration of the chlorination the ring structure is broken through. There are no indications of the existence of mono-, tri- and penta-Cl derivs. The stability of the chlorinated dioxanes increases greatly with increasing Cl content, the stability of II being so great as to prevent investigation of its structure. I reacts with *o*-$C_6H_4(OH)_2$ to give a *compd.* $C_{18}H_{10}O_4$, m.

74–6°; $PhCH_2OH$ gives the *compd.* $C_{18}H_{18}O_4$, m. 66–8°; Et *d*-tartrate gives the *compd.* $C_{12}H_{18}O_8$, m. 93.3–4.7°, $[\alpha]_D^{25}$ —0.30° (0.8% EtOH soln.); AcOK gives the compd. $C_8H_{12}O_6$, m. 104–5.5°. Formulas are given for these compds. C. J. West

**Identification and biochemical oxidation of α-glucoheptulitol.** Mme. Y. Krouvine and G. Nitzberg. *Compt. rend.* **196**, 218–20(1933); cf. *C. A.* **23**, 373.—Examn. of x-ray diagrams of α-glucoheptulitol (I), α-glucoheptitol and β-glucoheptitol shows that I cannot be a mixt. of the others. Values are tabulated for the angles 4 θ calcd. for the rays of greater intensity for the 3 compds. According to the proposed formula for α-glucoheptulose one could ignore the diversities just noted and give to I the formula of β-glucoheptitol. An alc. of this structure if oxidized by the sorbose bacteria or *Acetobacter xylinum* would normally give β-glucoheptulose. K. and N. prepd. medium from α-glucoheptulitol and yeast ext. The sorbose bacteria oxidized the alc. in 1.5 months producing 80% of reducing sugar. The product was pptd. with $Pb(OAc)_2$ and recrystd. from alc. several times. It m. 173°, reducing power 86% as strong as glucose, $[\alpha]_D^{16}$ —63°. These data and x-ray diagrams show the product to be α-glucoheptulose. α-Glucoheptulitol was recovered from the mother liquor. It is shown that the accepted formula for β-glucoheptitol is not suitable for α-glucoheptulitol. A. E. White

**The $C_4$-saccharinic acids. VI. Further attempts to prepare 2,2′-dihydroxyisobutyric acid. 2,3-Dihydroxybutyric acid lactone from glycidol. Preparation of the two iodohydrins of glycerol.** J. W. E. Glattfeld and Rosalind Klaas. *J. Am. Chem. Soc.* **55**, 1114–19(1933); cf. *C. A.* **25**, 4849.—The addn. of HCN to glycidol, followed by hydrolysis of the addn. product, resulted in a 25–50% yield of 2,3-dihydroxybutyrolactone; under certain conditions 3-hydroxyisocrotonolactone was formed. Further attempts were made to prep. 2,2′-dihydroxyisobutyric acid from $CHCl(CH_2OH)_2$ (I) and heavy-metal cyanides; from the diacetate of I, $ClCO_2Et$ and Na-Hg; and from pentaerythritol by oxidation with $Ba(MnO_4)_2$ or $KMnO_4$; these attempts were unsuccessful. α-Glycerol iodohydrin has been prepd. in 15% yield by the interaction of the chlorohydrin with NaI in $Me_2CO$; it also results by the hydrolysis of isopropylidene α-iodohydrin, formed as a by-product in the above reaction. The *β-isomer*, m. 52–3°, was similarly prepd. in 18% yield; with NaCN it yields 2,3-dihydroxybutyric acid. C. J. West

**1,3-Dimethylbarbituric acid as an aldehyde reagent.** Shiro Akabori. *Ber.* **66B**, 139–43(1933); cf. *C. A.* **26**, 5077.—In a search for a sp. means for isolating and identifying small amts. of furfural (I) mixed with aliphatic aldehydes and ketones 1,3-dimethylbarbituric acid (II) was found to be a very good reagent for identifying aldehydes, RCHO, with which it forms condensation products of the structure $RCH{:}C(CO.NMe)_2$-CO. The products with I and aromatic aldehydes are almost all easily crystd. and have sharp m. ps.; HCHO and AcH, however, give products which, although cryst., do not melt sharply, and iso-BuCHO and citronellal yield only tarry products. The following *derivs.* of II were obtained by heating the aldehyde and II in water or aq. alc. for a few min. on the water bath; the yields were in general 80–90% (97–8% with I and methylfurfural): *benzal*, light yellow, m. 164–5°; *cinnamylidene*, orange-yellow, m. 196–7°; *anisal*, light yellow, m. 148.5–9°; *p-methylbenzal*, light yellow, m. 142–2.5°; *vanillylidene*, yellow, m. 222.5–3°; *piperonylidene*, yellow, m. 201.5–2°; *m-hydroxybenzal*, yellow, m. 233–4°; *p-hydroxybenzal*, yellow, m. 297–8°; *o-nitrobenzal*, m. 156.5–7°; *p-nitrobenzal*, yellow, m. 196–6.5°; *furfurylidene*, yellow, m. 195–6°; *5-methylfurfurylidene*, yellow, m. 172–2.5°; *5-hydroxymethylfurfurylidene*, yellow, m. 181–2°; *5-ethoxymethylfurfurylidene*, orange-yellow, m. 112.5–13°; *furylacrylidene*, brick-red, m. 223–4°; *β-indolylidene*, yellow, m. 291–2°; *citrylidene*, m. 101–1.5°; *salicylidene*, yellow needles, m. 177–8° (effervescence), changing on repeated crystn. from BuOH into colorless crystals, m. 236–7°, which, from their compn. and mol. wt. in camphor (387), are apparently *salicylidenebis(dimethylbarbituric) anhydride*, $C_{19}H_{18}O_6N_4$; *o-vanillylidene*, yellow needles, m. 180–1°, likewise changing into white crystals, m. 237–8°, presumably of the *bis(dimethylbarbituric) anhydride*. The condensation products of barbituric acid with I and its derivs. give with $PhNH_2$ or $PhNH_2.HOAc$ strong color reactions which for I and its 5-Me and 5-$HOCH_2$ derivs., resp., differ quite distinctly from each other and are sufficiently sensitive to permit detection of the aldehydes at dilns. of 1:1,000,000. The condensation products with II give similar colors with $PhNH_2$ but the differences between the 3 aldehydes are not so distinct. C. A. R.

**Action of alkalies on the monobasic sugar acids. I. Conversion of gluconic to mannonic and of galactonic to talonic acids by the action of barium hydroxide.** Howard T. Bonnett and Fred W. Upson. *J. Am. Chem. Soc.* **55**, 1245–8(1933).—Epimerization may be produced by the action of $Ba(OH)_2$; gluconic acid has been converted to mannonic acid, mannonic acid to gluconic acid and galactonic acid to talonic acid, in yields comparable with those obtained by the use of $C_5H_5N$ and $C_9H_7N$. The process described furnishes perhaps the most convenient method for obtaining mannonic and

talonic lactones. A possible mechanism is suggested for the formation of isomeric hexonic acids in the alk. oxidation of hexoses. C. J. WEST

**Some properties of *d*-xylonic lactone.** V. HASENFRATZ. *Compt. rend.* **196**, 350–3 (1933).—*d*-Xylonic lactone was converted into *Pb d-xylonate*, $(C_5H_9O_6)_2Pb.5H_2O$, m. 59°, $[\alpha]_D^{18}$ —5.9° (in $H_2O$). With $H_2S$ this gives the pure, cryst. lactone, m. 99–103°, $[\alpha]_D^{18}$ 85.5°. The rotatory power of the soln. diminishes on standing. With $Ac_2O$ and $ZnCl_2$ it gives a *tri-Ac deriv.*, m. 99°, $[\alpha]_D^{18}$ 62.4° (in EtOH). It can be recrystd. from $H_2O$ without formation of the acid. ALFRED HOFFMAN

**Effect of hydrocyanic acid on methylglyoxal.** C. V. SMYTHE. *Biochem. Z.* **257**, 371–84(1933); cf. *C. A.* **27**, 62–3.—HCN and AcCHO form an addn. compd. which is easily oxidizable by reacting directly with $O_2$. The products of this oxidation are AcOH, $CO_2$ and a small amt. of $HCO_2H$. In the absence of $O_2$ the compd. reacts with a mol. of free AcCHO which serves as the oxidizing agent, $AcCO_2H$ being the product of the anerobic oxidation and a reduction product with at least 6 C atoms. For every mol. $AcCO_2H$ formed about 2 mols. AcCHO disappear. Both the anerobic and aerobic reactions proceed with the same speed and with an excess of HCN the direct reaction with $O_2$ can be made practically quant. S. MORGULIS

**Preparation of the ketol $C_6H_{10}O_3$ and of methylglyoxal.** M. HENZE AND R. MÜLLER. *Z. physiol. Chem.* **214**, 281–4(1933).—The heretofore relatively inaccessible AcCHO can now be obtained with little cost and trouble by the method of Riley, Morley and Friend (*C. A.* **26**, 4305). This consists in the oxidation of MeAc by refluxing with $SeO_2$, recovery of Se and unoxidized MeAc and vacuum distn. of $AcCH(OH)_2$. The yield is 90–100 g. pure AcCHO from 2 l. of MeAc. Condensation of AcCHO and $AcCH_2CO_2H$ to the ketol $AcCH(OH)CH_2Ac$ in 50% yield is described at length. A. W. D.

***d*-Galacturonic acid. I. Methyl 1-methyl-*d*-galacturonate and 1-methyl-*d*-galacturonic acid.** FELIX EHRLICH AND RENATE GUTTMANN. *Ber.* **66B**, 220–7(1933).—The acetalization and esterification of *d*-galacturonic acid (I) were undertaken to obtain simple compds. with which to study the general properties of substances like pectin and which might be used for model expts. for pectolase and pectase. By the Fischer method for prepg. Me glucosides (heating with HCl in MeOH under pressure), I yields, with relative ease, about 33% of *Me α-1-methyl-d-galacturonate* (II), and by the Voss method with $Me_2SO_4$ and HCl in MeOH (*C. A.* **25**, 1798) is obtained 50–5% of a mixt. of II and the *β-isomer* (III), sepd. by fractional crystn. from acetone. I seps. in stout quadratic columns and truncated tablets, II in fine needles arranged in druses, so that the 2 forms can sometimes be sepd. by decantation. The 2 epimers are readily sapond. (by cold $Ba(OH)_2$) to the *α*- (IV) and *β-acids* (V) which with dil. acids on the water bath yield I. In addn. to II and III, the Voss method also gives about an equal amt. of a non-reducing sirup, sapond. by $Ba(OH)_2$ to a sirupy acid which on further hydrolysis with dil. acids gives a strongly reducing soln. from which cryst. I seps. It is possible that the original reaction mixt. contains, besides II and III, a γ-isomer or an easily sol. and difficultly crystallizable furoid form. In an extensive series of expts. it was found that all ferments for *α*- and *β*-glucosides and complex galacturonic acids (maltase, emulsin and pectolase from various sources) have absolutely no action on II-V under the most varied conditions, and the same is true of an *α*- and *β*-galactoside-cleaving ferment mixt. obtained from emulsin (Helferich, *et al.*, *C. A.* **26**, 4070). On the other hand, a pectase obtained from lucerne (Bertrand and Mallèvre, *Compt. rend.* **121**, 726(1895)) hydrolyzed II (distinctly in 1 day, 30% in 4 days). II, seps. with 1 $H_2O$, m. 139–42° (decompn.), $[\alpha]_D^{20}$ 125.0° (0.1072 g. hydrate in 10 cc. water), $[\alpha]_D^{23}$ 131.9° (0.1403 g. anhyd. ester in 10 cc. water) III, sinters 189°, m. 193–4°, $[\alpha]_D^{19}$—45.6° (0.1064 g. in 10 cc. water). IV, tablets with 2 $H_2O$, m. 109–13°, $[\alpha]_D^{20}$ 129.9° (0.1189 g. in 10 cc. water). V, needles with 1 $H_2O$, sinters 126°, m. 134° (decompn.), $[\alpha]_D^{21}$ —39.2° (0.1366 g. hydrate in 10 cc. water), $[\alpha]_D^{20}$ —40.5° (0.1124 g. anhyd. acid in 10 cc. water). Since this work was completed there has appeared a preliminary paper by Link (*C. A.* **26**, 5913) on the isolation of a Me galacturonide which seems to be identical with IV. C. A. R.

**Recent studies in tautomerism.** R. P. LINSTEAD. *Sci. J. Roy. Coll. Sci.* **2**, 79–87 (1932). E. H.

**Mercuration of compounds containing a reactive methylene group by means of mercuric chloride. II.** K. G. NAIK AND R. P. PATEL. *J. Indian Chem. Soc.* **9**, 533–7 (1932); cf. *C. A.* **26**, 5547.—An active $CH_2$ group may be converted to a C:Hg group by the following typical procedure: A soln. of 1 g. $NaHCO_3$ is added to soln. of 1 g. malonomonophenylamide (I) and 1.15 g. $HgCl_2$ in boiling EtOH. *Mercurimalonomonophenylamide* (II) seps. immediately; the reaction is completed by 0.5 hr. boiling. In this way *mercurimalonamide* (III), m. 286°; *di-Et mercurimalonate*, undecompd. below 300°; *Et mercuriacetoacetate*, blackening above 270°; *mercuriacetoacetanilide*, m. 205°; *mercuriacetoaceto-o-toluide*, m. 230°; *mercuriacetoaceto-p-toluide*, m. 243–7°; and the following mercurimalonomono derivs. were prepd.; *o-toluide* (IV), m. 257–9°; *p-toluide*,

m. 278–9°; *m-toluidide*, m. 255°; *α-naphthylamide*, m. 269°; *β-naphthylamide*, m. 270°; *1,3,4-xylide*, m. 270°. All these compds. m. with decompn. II and HCl give I; II and $H_2S$ yield HgS quantitatively; and with $PhNHNH_2$ or $N_2H_4$ Hg is liberated from II. With Br, III forms dibromomalonamide. The C:Hg linkage of IV is quantitatively broken by cold aq. KI. A. F. SHEPARD

**Optimum conditions for preparing *d*-glutamic acid hydrochloride from wheat gluten. II. Effect of purity of acid, time of reaction, climatic conditions and other experimental circumstances.** CHAO-LUN TSENG AND EDITH JU-HWA CHU. *Science Quart. Natl. Univ. Peking* **3**, 53–68(1932); cf. *C. A.* **26**, 5548.—In the hydrolysis of wheat gluten to *d*-glutamic acid-HCl by means of HCl, the purity of the HCl and the use of pressure heating had little or no effect upon the yield, but the time of heating had a pronounced effect, the optimum being 7 hrs. Heatings of 4 hrs. or less were too short. About 9 hrs. of preliminary digestion before refluxing improved the yield slightly. Dried gluten gave better yields than wet material, sun-dried gluten being better than oven-dried material. The grinding of sun-dried gluten to a powder had a favorable effect. In general the results of these expts. done in Peking showed lower yields than the author's previous expts. performed in Nanking. The difference is thought to be due to the climatic differences of the 2 cities. H. W. LEAHY

**The decolorization of the solution in the preparation of *d*-glutamic acid hydrochloride by hydrolysis of wheat gluten.** CHAO-LUN TSENG AND EDITH JU-HWA CHU. *Science Quart. Natl. Univ. Peking* **3**, 69–74(1932); cf. preceding abstr.—Japanese active C was found to be superior to any other C tried in decolorizing power, the C from chestnuts or peanuts being nearest to it. Com. samples of animal C, besides being inferior, have the disadvantage of contg. $Ca_3(PO_4)_2$ which causes a great inconvenience and a substantial lowering of the yield due to the pptn. of this impurity during the vacuum distn. H. W. LEAHY

**The tartrates of cadmium.** PARISELLE AND BARBIER. *Compt. rend.* **196**, 114–16 (1933).—The tartrates of Cd were studied principally by the addn. of NaOH to soln. of 1 part $CdSO_4$ and 4 parts Na tartrate. The changes in soly. and in the rotatory power indicate the existence of a no. of acid and basic salts. ALFRED HOFFMAN

**Preparation of some structurally related monoguanidines.** CHARLES E. BRAUN. *J. Am. Chem. Soc.* **55**, 1280–4(1933).—$C_6H_{13}NH_2$ (14.5 g.) and 21 g. *S*-methylisothiourea sulfate in 60 cc. $H_2O$, refluxed at 100° for 5 hrs., give 18.2% (5 g.) of *hexylguanidine sulfate*, m. 210–2°. *Cyclohexylguanidine-HCl*, m. 224–6°, results in 64% yield from cyclohexylamine-HCl (m. 204–5°) and cyanamide in abs. EtOH by heating 6 hrs. at 100°. *o-Tolylguanidine-HCl*, m. 133–5° (31.6% yield); *m-tolylguanidine sulfate*, m. 215–7° (31.1%); *p-tolylguanidine-HCl*, m. 136–7° (17.4%); the by-product is *p*-tolylbiguanide-HCl, m. 245–7°. *α-Methyl-α-phenylguanidine-HCl*, m. 217–8° (35.3%). *β-Phenylethylguanidine sulfate*, crystals with 1 mol. EtOH, softens 60–5°, m. 175–7° (40.3% yield). C. J. WEST

**Hydroxyallantoin.** A. PINGUET. *Compt. rend.* **196**, 112–14(1933).—Hydroxyallantoin (I), prepd. according to Grimaux from parabanic acid and urea (*Bull. soc. chim.* **32**, 120(1879)), is a mixt. of I and oxalyldiureide. The crude product, washed with cold $H_2O$, dissolved at 0° in dil. NaOH and neutralized to phenolphthalein with AcOH, gives the Na deriv. of I. An excess of AcOH gives I, m. 270°. Oxalyldiureide differs from I in the following: it is insol. in $H_2O$, does not give the biuret reaction and reacts differently with a no. of other reagents. ALFRED HOFFMAN

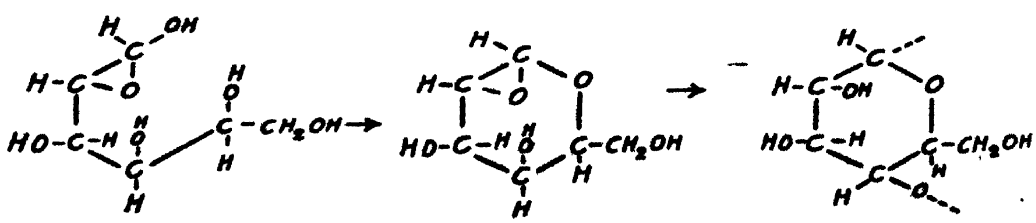
**Imidazole derivatives of barbituric acid.** MILLARD S. TAGGART AND G. HOLMES RICHTER. *J. Am. Chem. Soc.* **55**, 1110–11(1933).—4(or 5)-Chloromethylimidazole and and $BuCH(CO_2Et)_2$ condense with EtONa to a glassy solid (55.9% yield), which with $CO(NH_2)_2$ yields *5-butyl-5-[4(or 5)-imidazolemethyl]barbituric acid*, decomps. about 290°; the *5-iso-Am deriv.*, prepd. similarly, decomps. without melting. C. J. WEST

**Ethylene-*N*,*N'*-bisbarbital, a dimolecular barbital with hypnotic properties.** ARTHUR W. DOX. *J. Am. Chem. Soc.* **55**, 1230–2(1933).—Ethylenediurea and $Me_2C(CO_2Et)_2$, heated with 10% EtONa 7 hrs. at 100–6°, give 75% of *ethylene-N,N'-bisbarbital* (I), m. 189°; Et hexylethylmalonate gives *ethylene-N,N'-bis(5-hexyl-5-ethylbarbituric acid)* (II), a transparent gum, which may consist of 2 pairs of optical isomers; $PhEtC(CO_2Et)_2$ gives 50–8% of *ethylenebis(carbethoxyurea)* (III), m. 219° (decompn.), which gives with 25% $NH_4OH$ at 100° *ethylenebisbiuret*, m. 245° (decompn.). I showed hypnotic potency equal to about 75% that of barbital; II was much feebler in its action. A 2-mg. dose caused very noticeable drowsiness in a 20-mg. mouse but no anesthesia; an increase to 2 and 4 times this dosage gave the same effect; the limiting factor appears to be the rate of absorption which in turn is limited by the insoly. of the free acid. The formation of III appears to be an exchange of $CO_2Et$ for H instead of the usual barbituric acid condensation. A by-product is $PhEtCHCO_2Et$. C. J. WEST

**Precipitation of sugars and polyols by metallic hydroxides in alkaline media. I.**

**General character of this precipitation.** PAUL FLEURY AND JEAN COURTOIS. *J. pharm. chim.* **16**, 97–109(1932). II. **Mechanism of the precipitation; practical results.** *Ibid* 145–61.—Cf. *C. A.* **24**, 1625; **26**, 3780. S. WALDBOTT

**Synthesis of gluco-*m*-hydroxybenzaldehyde.** NÁNDOR MAUTHNER. *Math. naturw. Anz. ungar. Akad. Wiss.* **48**, 473–5(in German 476–7)(1931).—Acetobromoglucose was condensed with *m*-$HOC_6H_4CHO$. The tetraacetylgluco-*m*-hydroxybenzaldehyde was sapond. with dil. ammonia to a cryst. product m. 160–1°, sol. in warm alc. and water, which was found to be different from picein. S. S. DE FINÁLY



**Preparation of octaacetyl and haloacetyl derivatives of turanose.** JENÖ PACSU. *Math. naturw. Anz. ungar. Akad. Wiss.* **48**, 485–91(in English 492–3)(1931).—Three octa-Ac derivs. m. 216–7°, 156–7° and 95°, $[\alpha]_D^{20}$ in $CHCl_3$ 20.5°, 105.9° and 125.4°, were obtained instead of the theoretical 2 isomerides. The acetochloro, acetobromo and acetoiodo derivs. corresponding to the 2nd isomer m. 165°, 133–4°, 105–6°, $[\alpha]_D^{20}$ —0.4°, —30.5° and —54.2°. No Walden inversion occurred during their formation. β-Acetobromoturanose in acetone gave in the presence of $Ag_2CO_3$ with water β-hepta-acetylturanose, m. 145–6°, $[\alpha]_D^{20}$ 36.9°. S. S. DE FINÁLY

**Sucrose and other disaccharides. Sir James Irvine's correction.** H. C. CARRINGTON, W. N. HAWORTH AND E. L. HIRST. *J. Am. Chem. Soc.* **55**, 1084–90(1933); cf. Irvine and McGlynn, *C. A.* **26**, 969, 3781.—The oxidation of 2,3,6-trimethylglucose under various conditions has been studied with results contrary to the conclusions of I. and M. 2,3,6-Trimethyl-γ-gluconolactone (I) is a cryst. substance, the properties of which diverge widely from those ascribed to this lactone by I. and M. It is shown that dimethylmethylglucoside is readily extd. from aq. soln. by $CHCl_3$. I $b_{0.05}$ 130°, m. 29–30°, $n_D^{18}$ 1.4625, $[\alpha]_D^{18}$ 55° ($H_2O$, *c* 2), 56° (EtOH, *c* 0.5), 55° (50% EtOH, *c* 0.4). The rate of mutarotation is similar to that of tetramethyl-γ-gluconolactone. The rotation of the acid in $H_2O$ is $[\alpha]_D^{20}$ 28° (initial), 32.5° (const.); the *phenylhydrazide* m. 145°. The oxidation of the glucose with Br and $CaCO_3$, by Isbell and Hudson's method and by $HNO_3$ is also discussed. The bearing of these results on the critical views of I. concerning the chemistry of sucrose and other disaccharides is discussed. C. J. WEST

**Molecular structure of polysaccharides.** W. N. HAWORTH AND E. L. HIRST. *Trans. Faraday Soc.* **29**, 14–17(1933).—Review. FRANK URBAN

**Nature of the mechanism of polymerization.** H. HIBBERT AND S. Z. PERRY. *Can. J. Research* **8**, 102(1933).—Exptl. evidence has been obtained in support of the theory that the polymerization of $\overline{CH_2.CH_2.O}$ first involves activation by the catalyst (aq. alkali), followed by ring fission and the addn. of $H_2O$ to give $CH_2(OH)CH_2OH$ (I). I adds to another mol. of the open chain form of $\overline{CH_2.CH_2.O}$ to give $(CH_2CH_2OH)_2$ and so on. The mechanism involved is the addn. of HX to the open chain form of $\overline{CH_2.CH_2.O}$, X representing $—(OCH_2CH_2)_yOH$, where *y* has the values 0, 1, 2, 3, etc., thus giving rise to chain formation. R. B. SANDIN

**Plant synthesis of carbohydrates and polysaccharides.** H. HIBBERT. *Can. J. Research* **8**, 103–4(1933).—The $\dot{C}H_2.CH_2.O$ polymerization theory provides a working hypothesis for the plant synthesis of sugars and polysaccharides. The ethylene oxide form of glucose and fructose (I) by loss of $H_2O$ yields the anhydride (II). The addn. of a mol. of hexose (HX) to the free valence form of the ethylene oxide ring in II yields a disaccharide and so on (intermol. chain synthesis). Polysaccharide chain formation may be brought about by intramol. glycidol chain polymerization as shown in the conversion of II to III (cf. Levene and Walti, *C. A.* **23**, 99; Nef, *Ann.* **355**, 191).

(I) (II) (III)

R. B. SANDIN

**Anionotropic and prototropic changes in 4-hydroxycyclopentenones.** H. BURTON AND C. W. SHOPPEE. *Chemistry and Industry* **1932**, 981.—B. and S. have investigated the changes involved in the conversion of *4-hydroxy-3,4-diphenyl-5,5-dimethyl-* $\Delta^2$-

*cyclopentenone* (I) into the isomeric *2-HO deriv.*, (II). Acetylation of I gives an acetate m. 137°, which is believed to be *2-acetoxy-3,4-diphenyl-5,5-dimethyl-*$\Delta^2$*-cyclopentenone* (III). Hydrolysis of III gives II which is thought to be a prototropic change. The evidence furnished is the prepn. of 3 isomeric ethoxy-3,4-diphenyl-5,5-dimethylcyclopentenone 2,4-dinitrophenylhydrazones. H. W. LEAHY

**The reactions between the bromonitro derivatives of toluene and sodium thiophenate.** ED. BOURGEOIS AND JEAN HENRION. *Bull. soc. chim.* **51**, 1416–24(1932); cf. *C. A.* **6**, 608.—The variable activity of the Br atom in bromonitro derivs. of MePh has been investigated by a study of their double decompn. reactions with PhSNa. The derivs. contg. Br *para* and *ortho* to the $NO_2$ group reacted readily with formation of NaBr and mononitrated tolyl Ph sulfides. No NaBr was formed with *m*-derivs. but insol. indeterminate compds. contg. N and Br were produced, probably as the result of the reduction of the $NO_2$ group when this was not hindered by the presence of an *o*-Me grouping. The dinitro compds. contg. $NO_2$ groups in the *o*- and *p*-positions to the Br atom reacted by double decompn. more readily than the mononitro compds. PhSH, b. 169.5°, prepd. by the reduction of $PhSO_2Cl$, $b_{20}$ 131.4°, with powd. Zn and HCl, was dissolved in abs. alc. and treated with an equiv. quantity of Na to yield the required PhSNa (I). The addn. of 20 cc. of dry Br at a rate of 10 drops per min. to 56 g. of *m*-$O_2NC_6H_4Me$, b. 230°, and of *p*-$O_2NC_6H_4Me$, m. 54°, in the cold in the presence of 10 g. of sublimed $FeCl_3$ gave 85% yields of *p*-nitro-*o*-bromotoluene (II), $b_{38}$ 175°, m. 77.5°, and a mixt. of *m*-nitro-*o*-bromotoluene (III), $b_{14}$ 121°, m. 77.5°, and *m*-nitro-*p*-bromotoluene (IV), $b_{13}$ 147–8° (non-cryst.). The bromination of toluene in the presence of powd. Fe gave *p*-$BrC_6H_4Me$, b. 172–82°, m. 28.5°, which on nitration with fuming $HNO_3$ at 0° yielded a mixt. of *o*-nitro-*p*-bromotoluene (V), b. 256°, m. 47°, and IV. The nitration of *m*-$BrC_6H_4Me$ (*Ann.* **168**, 153(1873)), b. 182–3°, by the slow addn. of 100% $HNO_3$ at 0° gave a mixt. of solid *o*-nitro-*m*-bromotoluene (VI), b. 267°, m. 55.5°, and liquid *p*-nitro-*m*-bromotoluene (VII), b. 269° (liquid at —20°). The violent reaction of *m*-$BrC_6H_4Me$ with fuming $HNO_3$ at 0° yielded chiefly 2,4-dinitro-5-bromotoluene (VIII), m. 103°. The double decompn. reaction was carried out by adding 0.1 mol. of the bromonitro compds. in 100 cc. of a mixt. of abs. alc. and anhyd. $Et_2O$ to 13.2 g. (0.1 mol.) of I in 100 cc. of abs. alc., refluxing on the steam bath, concg. and pptg. the org. products by the addn. of $H_2O$. III, VI, VII and VIII were converted after refluxing 1.5–2 hrs. into the corresponding substituted-tolyl Ph sulfides, m. 82.8°, 72°, 59.5° and 114.5°, resp., with almost theoretical yields. The *m*-nitrotolyl Ph sulfide from III was oxidized by $KMnO_4$ in AcOH into the *sulfone*, m. 104° (yield 80%). C. R. ADDINALL

**The structure of musk ketone.** A. E. CHICHIBABIN. *Bull. soc. chim.* **51**, 1436–62 (1932).—By the action of AcCl on sym. butylxylene in the presence of $AlCl_3$, Baur (*Ber.* **31**, 1346(1898)) obtained the ketone, acetylbutylxylene (I), which gave on nitration a dinitro deriv. (II) with a strong odor of musk, the so-called musk ketone. On the basis of a series of transformations of I into the corresponding nitrile and on the results of a stepwise oxidation and degradation of I through a supposed dimethylbutylcarboxyphenylglyoxylic acid (III) and butylmethylphthalic acid (IV) to methylbutylbenzoic acid (V), B assigned to II the asym. structure, 2,4-dinitro-5-butyl-6-acetyl-*m*-xylene (*Ber.* **33**, 2568(1900)). C. remarks that the m. p. and odor of II contradict this asym. formulation and notes the curious behavior of IV on heating. In the prepn. of the mononitro deriv. of I only the sym. nitrobutylxylene is formed. A mixt. of 20 cc. of $HNO_3$ (d. 1.49 g.) and 20 cc. of $Ac_2O$ was added dropwise to a cooled soln. of 25 g. of I in 25 cc. of $Ac_2O$, and after 30 min. the reaction mixt. was poured onto ice. The sepn. of the products gave 21.6 g. (70.8%) of 1,3-dimethyl-5-butyl-2-acetyl-4-nitrobenzene, m. 56°, and 6.2 g. (24.8%) of 2-nitro-5-butyl-*m*-xylene, m. 85° (total yield 95.6%). This lack of isomers and the anomalous behavior noted all pointed to a sym. structure formulation for I and II and suggested a verification of the oxidation expts. and a detailed examn. of IV. The oxidation of I, m. 47°, by alk. $KMnO_4$ at 60–5° gave the same mixt. of acids, mostly methylbutylcarboxyphenylglyoxylic acid, m. 90–110°, that B. found on carrying out the oxidation above 70° and which he supposed to be dimethylbutylphenylglyoxylic acid. The mixt. was oxidized by 20% $H_2SO_4$ and $MnO_2$ and after working up yielded 2,6-dimethyl-4-butylbenzoic acid (VI), m. 168°, and 3-methyl-5-butylphthalic acid (VII), m. 180° (decompn.), transformed by loss of $H_2O$ to an *anhydride*, m. 129°. IV was shown to be a mixt. of VI and VII. By heating 2 g. of I with 5 g. of $NH_2OH.HCl$ and 6 cc. of MeOH in a sealed tube at 160° for 5 hrs. the ketone was transformed by a Beckmann rearrangement into the Ac deriv. of 2-amino-1,3-dimethyl-5-butylbenzene, m. 160°, identical with the deriv. obtained by the acetylation of the amine (VIII) obtained by the reduction of 2-nitro-1,3-dimethyl-5-butylbenzene. (B. records m. p. 81°—probably the m. p. of an unstable polymorph.) This transformation of I leaves no doubt as to the correctness of assigning to the ketone the sym. formulation, 2-acetyl-5-butyl-*m*-xylene. At room temp. I dissolves in 93% $H_2SO_4$ and reacts, with sepn. of the Ac

group, to yield principally and almost uniquely the same butylxylenesulfonic acid as that formed by the sulfonation of butylxylene with fuming $H_2SO_4$. By fusion of the K salt with KOH both yield a phenol identical with the 2-hydroxy-1,3-dimethyl-5-butyl benzene, m. 84°, obtained by the action of $HNO_2$ on VIII, proving conclusively the sym. structure of the phenols and sulfonic acids. Sym. dinitrobutylxylene and the phenol (and its Me ether) obtained from sym. dinitroaminoxylene by the action of $HNO_2$ all have a feeble odor of musk. Of the derivs. of butylxylene with an odor, the isomers whose structural formulas possess a plane of symmetry have a more agreeable odor than those with an asym. structure. Sym. derivs. of butylxylene have a higher m. p. than the asym. compds. From the above results it is necessary to change the structural formulas for the series of compds. related to the ketone producing musk-ketone to the following: 2,6-dimethyl-4-butylphenylglyoxylic acid, 2,6-dimethyl-4-butylbenzoic acid, 2,6-dimethyl-4-butylbenzaldehyde, 2,6-dimethyl-3,5-dinitro-4-butylbenzaldehyde (musk-aldehyde), 3-methyl-5-butylphthalic acid, 3-methyl-5-butyl-1,2-phthalidecarboxylic acid, and to change to the sym. formulation the series of ketones, obtained from butylxylene by the Friedel-Crafts reaction, whose dinitro derivs. have a musk odor and the furoxan derivs. obtained by the oxidation of the sym. ketone and its nitro derivs. The asym. derivs. of the ketone and of the above enumerated compds. should be considered as unknown. Although asym. compds. possessing an agreeable odor are known, the facts are in favor of the general rule: sym. structure is a favorable factor for odoriferous properties. C. R. ADDINALL

**Diselenomesoxyanilide and oxyselenanilide.** A. BARONI. *Atti accad. Lincei* **16**, 253–6(1932).—*Diselenomesoxyanilide* (I) is prepd. by heating 9 g. malonanilide, in 25 cc. anhyd. $C_6H_6$, with 5 g. $Se_2Cl_2$, also in 25 cc. anhyd. $C_6H_6$. The ppt. appearing on cooling and recrystd. from acetone, m. 209–10°. The reaction is $(ArNHCO)_2CH_2 + Se_2Cl_2 \longrightarrow (ArNHCO)_2CSe_2 + 2HCl$. Treated with hot $HNO_3$ (d. 1.5), I dissolves completely, and on cooling the nitrate seps. as small yellow crystals, m. 224°, recrystd. from EtOH. The *p*-toluidine deriv. m. 211°, and also forms a nitrate m. 215°. *Oxyselenanilide* (II) is prepd. by heating together $Se_2Cl_2$ and $PhNH_2$. It is a liquid b. 210° (decompn.), and $b_{26}$ 111° without decompn. It is yellow-orange and has an aromatic odor. The corresponding *p*-toluidine deriv. is an orange oil, b. 245° (decompn.), or $b_{26}$ 130° without decompn. Heated with $ZnCl_2$, II, as well as the *p*-toluidine deriv., give blue dyes, which are difficult to dissolve. A. W. CONTIERI

**The formation and stability of polybromide derivatives of heterocyclic compounds. I. The bromination of diphenyl-ψ-thiohydantoin and its *o*-tolyl homolog.** MOHAMMAD OMAR FAROOQ AND ROBERT F. HUNTER. *J. Indian Chem. Soc.* **9**, 545–52(1932).—The N atom of benzothiazole apparently can hold Br atoms by heteropolar single bonds, but the S atom is inert in addn. reactions (Hunter, *C. A.* **24**, 1860). The S atom of a reduced thiazole ring is now shown to be also inert. Diphenyl-ψ-thiohydantoin and Br yield *2-phenylimino-3-p-bromophenyl-4-ketotetrahydrothiazole hydropentabromide* (I), vermilion, which loses Br at 140° and m. 161–3° (decompn.). I is also formed from Br and *2-phenylimino-3-p-bromophenyl-4-ketotetrahydrothiazole* (II); I liberates 4 I from KI and with HgO or $SO_2$ it yields II. Exposed to air or heated *in vacuo* at 135° it forms the corresponding *hydrotribromide*, yellow, m. 145–6° (decompn.), which with $SO_2$ also gives II. II m. 175°; it was prepd. from $ClCH_2CO_2H$ and *s*-phenyl-*p*-bromophenylthiocarbamide. II forms an *octabromide* (III), red, m. 161–2°, from which $SO_2$ or HgO regenerates II. III liberates 6 I from KI, yielding *2-phenylimino-3-o,p-dibromophenyl-4-ketotetrahydrothiazole* (IV), m. 119–20°. III and $H_2O$ also give IV. Di-*o*-tolyl-ψ-thiohydantoin and Br form *2-o-tolylimino-3-p(?)-bromo-o-tolyl-4-ketotetrahydrothiazole hydroheptabromide* (V), red, m. 120–1° (decompn.). V and KI or $SO_2$ yield *2-o-tolylimino-3-p(?)-bromo-o-tolyl-4-ketotetrahydrothiazole* (VI), m. 129°. On exposure V gives the corresponding *hydrotribromide*, yellow, m. 132° (decompn.). *s-o-Tolyl-p-bromo-o-tolylthiocarbamide*, from *p*-bromo-*o*-toluidine and *o*-tolylthiocarbimide, m. 152°; attempts to synthesize VI from this compd. were fruitless. A. F. SHEPARD

**Differentiation of the *O*- and *N*-methyl groups.** P. PFEIFFER AND E. OCHIAI. *J. prakt. Chem.* **136**, 125–8(1933).—$AlBr_3$ may be used to differentiate MeO and MeN, since MeO gives HO, while MeN is unchanged. Thus piperonal in $C_6H_6$ with 3 mols. $AlBr_3$ gives 49% $3,4\text{-}(HO)_2C_6H_3CHO$ and 8.5% anthracene, while $PhNMe_2$ in $C_6H_6$ is unchanged and $p\text{-}Me_2NC_6H_4CHO$ and $AlBr_3$ in $C_6H_6$ give $Ph_2CHC_6H_4NMe_2$. C. J. WEST

**The law of periodicity. VII. The activity of compounds with the substituents alike and different.** P. PETRENKO-KRITCHENKO, M. GOROCHOLINSKAYA AND A. TROZENKO. *Ber.* **66B**, 194–7(1933); cf. *C. A.* **24**, 5190–1.—Data are given for the rate of action of 0.1 *N* NaOH and *N* $PhCH_2NH_2$ on $CHCl_3$ and $CCl_4$, also for the hydrolysis of urea and $AcNH_2$ with NaOH and HCl. In general compds. having dissimilar substituents on the

same C possess greater activation energy, *e. g.*, $HCONH_2 > AcNH_2 > CO(NH_2)_2$.
B. A. SOULE

**Reaction of some carbonyl and thiocarbonyl compounds with phenylhydrazine.** L. CHAS. RAIFORD AND W. T. DADDOW. *Proc. Iowa Acad. Sci.* **38**, 171(1931); cf. *C. A.* **25**, 2701.—When the CO group is joined directly to C and H (aldehydic) or to C and C (ketonic) it reacts with $PhNHNH_2$ to give the corresponding phenylhydrazone. When the radical is joined directly to N and H, as in HCONHPh, the products are aniline and HCONHNHPh. Substitution productions of HCONHPh behave similarly. If the radical is joined directly to N and N, as in diphenylurea, the products are aniline and semicarbazide. The corresponding thiourea behaves similarly, and gives a thiosemicarbazide. If the reaction with the thioureas is carried out in the presence of a desulfurizing agent, guanidine derivs. are obtained. W. G. GAESSLER

**Biarsyls. V. Reactions of tetraphenylbiarsyl.** F. F. BLICKE, R. A. PATELSKI AND L. D. POWERS. *J. Am. Chem. Soc.* **55**, 1158–61(1933); cf. *C. A.* **27**, 967.—$Ph_4As_2$ and S give tetraphenylarsyl sulfide; SCl gives $Ph_2AsCl$ and S; $SOCl_2$ gives $Ph_2AsCl$, $SO_2$ and S; BrCN gives $Ph_2AsBr$; PhMgBr gives $Ph_3As$; $AsCl_3$ or $PCl_3$ gives $Ph_2AsCl$; phenylarsine oxychloride gives $Ph_2AsCl$ and PhAsO; Na-K alloy gives the K or Na deriv. of $Ph_2AsH$, which yields with PhBr $Ph_3As$, identified as the methiodide. AcCl, BzCl, $Ph_2CCl_2$, 2,4-$(O_2N)_2C_6H_3Br$, $(Ph_2CCl)_2$ or $(CH_2)_2O$ do not react with $Ph_4As_2$.
C. J. WEST

**Bistibyls. II. Tetra-*p*-bromotetraphenyl- and tetra-*p*-tolylbistibyl. Di-α-naphthyliodostibine.** F. F. BLICKE AND U. O. OAKDALE. *J. Am. Chem. Soc.* **55**, 1198–201 (1933); cf. *C. A.* **25**, 1823.—*p*-$BrC_6H_4SbO_3H_2$ acid in cold concd. HCl, filtered after 12 hrs., cooled and satd. with $SO_2$, gives *p-bromophenyldichlorostibine*, m. 90–2°; the oxide and HI (d. 1.65) give the *diiodo compd.*, m. 124–5°. The oxide, heated at 145° in a N atm. for 1 hr., gives the tetra-*p*-bromotetraphenylstibyl oxide, oily; AcOH gives *di-p-bromodiphenylstibyl acetate*, m. 134–5°; HI in hot AcOH gives *di-p-bromodiphenyliodostibine*, m. 73–4°; $NaH_2PO_2$ gives *tetra-p-bromotetraphenylbistibyl*, greenish yellow, m. 211–3° (decompn.). *p-Tolyldichlorostibine*, m. 89–92°; *tetra-p-tolylstibyl oxide*, m. 101°; *di-p-tolylstibyl acetate*, m. 122–3°; *di-p-tolyliodostibine*, m. 76–8°; *tetra-p-tolylbistibyl*, m. 155–7°. *α-Naphthyldichlorostibine*, m. 105–6°; *di-α-naphthyliodostibine*, m. 136–7°. The bistibyls possess properties similar to those of biarsyls. A procedure for the *detn. of Sb* is described. C. J. WEST

**Phenyl- and diphenylarsine.** F. F. BLICKE AND L. D. POWERS. *J. Am. Chem. Soc.* **55**, 1161–7(1933).—$PhAsH_2$ (I) in PhBr absorbs $O_2$ very rapidly at first and then more slowly until 1 mol. equiv. is taken up. S gives PhAsS and $H_2S$. I (2 mols.) and 4 mols. I give $PhAsI_2$ quant.; 2 mols. I give $(PhAs:)_2$, while with 3 mols. I gives $PhAs_2I_2$. I and $Ph_3AsCl_2$ give $Ph_3As$, $(PhAs:)_2$ and HCl. $Ph_2AsH$ (II) in PhBr absorbs $O_2$ rapidly, giving 93% diphenylarsinic acid. Equiv. quantities of II and I form quant. $Ph_2AsI$; half this quantity of I gives $Ph_4As_2$. II and $Ph_4As_2O$ give $Ph_4As_2$ (91% yield); $Ph_4As_2S$ gives the same product but in lower yield. II and PhAsCl(OEt) give $Ph_2AsCl$, $(PhAs:)_2$ and EtOH; $Ph_3CBr$ gives $Ph_2AsBr$ and $Ph_3CH$; $Ph_3C$ gives $Ph_3CH$ and $Ph_4As_2$. $Ph_3AsCl_2$ and 2 mols. equiv. of II give $Ph_3As$ and $Ph_4As_2$, while equiv. amts. give $Ph_3As$ and $Ph_2AsCl$. $Ph_4As_2$ and $Ph_3AsCl_2$ give $Ph_3As$ and $Ph_2AsCl$. II and $Ph_3As(OH)Cl$ give $Ph_3As$, $Ph_4As_2$, HCl and $H_2O$; the $Ph_4As_2$ reacts with more $Ph_3As(OH)Cl$ to give $Ph_4As_2O$, $Ph_2AsCl$, $Ph_3As$ and $H_2O$. C. J. WEST

**The chemistry of beryllium. V. Organic compounds of beryllium.** HAROLD S. BOOTH AND DOROTHY GORDON PIERCE. *J. Phys. Chem.* **37**, 59–78(1933).—Various sulfonates of Be have been prepd. by the double decompn. of Be salts of the organic acids with $BeSO_4$. The following have been prepd., analyzed and their properties studied: Be *p*-toluenesulfonate; Be *p*-xylenesulfonate, Be 2-chlorotoluene-5-sulfonate; Be benzenesulfonate; Be 2-nitrotoluenesulfonate; Be *m*-nitrobenzenesulfonate; Be benzoylacetonate; Be dibenzoylmethane and Be ethyl acetoacetate. I. J. PATTON

**Yields of some organolithium compounds by the improved procedure.** HENRY GILMAN, E. A. ZOELLNER AND W. M. SHELBY. *J. Am. Chem. Soc.* **55**, 1252–7(1933); cf. *C. A.* **26**, 3240.—Yields are reported for 20 organo-Li compds. prepd. in $Et_2O$ after the general procedure for the prepn. of Grignard reagents. Three sets of conditions were used, the differences being the size of the pieces of Li and the rate of addn. of the org. halide. Optimal conditions and general limitations are discussed. C. J. WEST

**Preparation of ketones by the carbonation of organolithium compounds.** HENRY GILMAN AND PAUL R. VAN ESS. *J. Am. Chem. Soc.* **55**, 1258–61(1933).—Usual procedures for the carbonation of organo-Li compds. give high yields of ketone and very little acid. The formation of acids for the characterization of organometallic compds. is markedly improved by the use of solid $CO_2$ or of the gas in the spray-procedure. A 2nd method for the prepn. of ketones, both simple and mixed, in satisfactory yields from organo-Li compds. involves interaction with salts. A mechanism of carbonation

is considered. PhLi and $CO_2$ give 4% BzOH, 70% $Ph_2CO$ and no $Ph_3COH$; in the spray method there resulted 37% BzOH and 8.7% $Ph_3COH$; solid $CO_2$ gave 60% BzOH, 15.4% $Ph_2CO$ and no $Ph_3COH$; carbonation at the b. p. of $Et_2O$ gave 1.6% BzOH, 76% $Ph_2CO$ and no $Ph_3COH$. *p*-$MeC_6H_4Li$, starting at 0° and ending at 15°, gave 1% *p*-$MeC_6H_4CO_2H$ and 77–81% (*p*-$MeC_6H_4)_2CO$; *o*-$MeC_6H_4Li$ gave 35% *o*-$MeC_6H_4CO_2H$. BuLi in $Et_2O$ cooled with an ice-NaCl bath gave 45–50% $Bu_2CO$. BzOLi and PhLi, refluxed in $Et_2O$ 5.5 hrs., give 70% $Ph_2CO$; $PrCO_2Li$ and PhLi in $Et_2O$, refluxed 8 hrs., give 62% PhCOPr. BzCl and PhLi give 42% $Ph_3COH$. BzOH and PhLi give 37.2% $Ph_2CO$ and 14.1% $Ph_3COH$. It is recommended that organo-Li compds. be prepd. in a N or H atm. C. J. West

**Relative reactivities of organolithium and organomagnesium compounds.** Henry Gilman and R. H. Kirby. *J. Am. Chem. Soc.* **55**, 1265–70(1933).—A study of the relative reactivities of organo-Li and organo-Mg compds. shows that the former undergo more rapid reaction with a selected no. of typical reactants. BuLi is more reactive than PhLi. Some compds., like *p*-$Me_2NC_6H_4CN$ and *p*-$MeOC_6H_4CN$, which do not react with the Grignard reagent, undergo prompt reaction with MeLi and PhLi to give the expected products. The unusual 1,4-addn. of PhMgBr to the lateral nuclear conjugated system in $Ph_2C{:}NPh$ is not shown by PhLi, which adds normally to the anil linkage, both under mild and forced conditions, to give $Ph_3CNHPh$. An explanation based, in part, on the different mol. vols. of the 2 organometallic compds. is proposed to account for the differences in behavior with sterically hindered functional groups. The relative reaction rates are given for PhMgBr and PhLi: PhCN (time in hrs.) 1.3, 0.07; $PhCH_2Cl$ 8, 2.4; PhN:NPh 8, 0.07; $Et_2SO_4$ 8, 0.23; PhCH:NPh 8, 0.07; $Ph_2C{:}NPh$ 8, 7; $PhCH{:}CHCO_2Et$ 1.6, 0.07; 2,1,4-$C_6H_3(NO_2)Me_2$ 1.3, 0.07; furfural 0.07, 0.07; $Me_2CAc$ 0.07, 0.07. BuMgBr and BuLi: PhCN 8, 0.07; $PhCH_2Cl$ 8, 0.07; PhN:NPh 0.5, 0.07; $Et_2SO_4$ 8, 0.11; PhCH:NPh 8, 0.07. C. J. West

**Mechanism of the reaction of phenylsodium and phenyllithium with phenyl isothiocyanate.** Henry Gilman and Fritz W. Breuer. *J. Am. Chem. Soc.* **55**, 1262–4 (1933).—PhLi and PhNa react with PhN:C:S to give $PhNHC(:S)Ph$ as a consequence of addn. to the C:S group and not to the anil linkage, as has been hitherto postulated in this widely used reaction for the characterization of organo-alkali compds. The reaction is more complicated than that observed with PhMgX but the essential mechanisms are alike. C. J. West

**Some rearrangement reactions of organosodium and organolithium compounds.** Henry Gilman and Fritz W. Breuer. *Proc. Iowa Acad. Sci.* **38**, 167(1931).—In continuation of rearrangement reactions of organometallic compds. it was desirable to ascertain whether R-metal combinations (free of halogen or other acidic groups) would react after the manner of $PhCH_2MgCl$ types with compds. like HCHO, for example This last reaction gives not only the normal product ($PhCH_2CH_2OH$), but also *o*-tolylcarbinol. It has been shown that the corresponding organosodium and organolithium compds. behave in a similar manner. Incidentally, it is possible to prep. some organolithium compds. like PhLi, very conveniently, in a short time, and in excellent yields in the customary 3-necked flasks. W. G. Gaessler

**Organic mercury compounds. V. Arylation of mercuric oxide by aromatic iodo compounds.** A. N. Nesmeyanov and L. G. Makarova. *Ber.* **66B**, 199–201; cf. *C. A.* **26**, 4028, 5295.—$PhIO_2$ (1.18 g.), 1.9 g. HgO paste and 40 cc. 10% KOH, shaken 8 hrs. and treated with KBr, give 19.6% of PhHgBr; in the presence of $Ag_2O$ the yield is 80%; $PhIO_2$, HgO, $Ag_2O$ and $Ba(OH)_2$ give 53%. *p*-$MeC_6H_4IO_2$, HgO and $Ag_2O$ give 92% of *p*-$MeC_6H_4HgBr$. *o*-$ClC_6H_4IO_2$ gives 84% of *o*-$ClC_6H_4HgCl$; the *m*- and *p*-isomers give 78 and 84%, resp., of the HgBr compd. *o*-$O_2NC_6H_4IO_2$ gives 48% of *o*-$O_2NC_6H_4HgCl$; the *m*- and *p*-isomers give 69 and 54%, resp. C. J. West

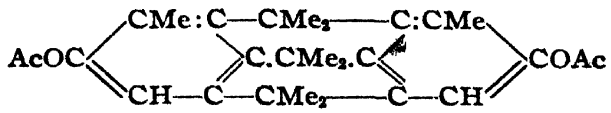
**Interconversion of arylmercuric halides and dimercury compounds. I.** Frank C. Whitmore and R. J. Sobatzki. *J. Am. Chem. Soc.* **55**, 1128–35(1933).—The relation of arylmercuric halides to diarylmercury compds. has been studied from the point of view of the equil. $2ArHgX \rightleftharpoons Ar_2Hg + HgX_2$. The alkali method for forcing this reaction to the right has been studied with 13 iodides; with 10 of these it was successful. The following new Hg compds. are reported: *o-tolylmercuric bromide*, m. 169.5°; *iodide*, m. 176°; *p-ethoxyphenylmercuric chloride*, m. 221°; *bromide*, m. 227–8°; *iodide*, m. 229°; *di-p-ethylphenylmercury*, m. 136.5°; *phenylethylmercuric iodide*, m. 154°. Solubilities are reported for ArHgI and $Ar_2Hg$ in 95% EtOH at 25° for Ar = Ph, *m*- and *p*-$MeC_6H_4$, *p*-$EtC_6H_4$, $PhCH_2$ and 2-*p*-cymyl. The action of alkali iodides with the arylmercuric halides is shown in a series of tables. The following arylmercuric iodides were converted to the Hg diaryls by refluxing with an excess of EtOH-NaI: *o*-, *m*- and *p*-tolyl, *m*-xylyl, mesityl, α- and β-naphthyl. PhHgI showed no change after refluxing for 300 hrs. The benzyl and cyclohexyl compds. decompd. on long heating with NaI. In the case of *p*-$EtC_6H_4HgCl$ a molar ratio of NaI to ArHgCl of 3.5:1 gave a mixt.

contg. 11% of the diarylmercury; a ratio of 4.5:1 gave 64% and a ratio of 9:1 gave complete conversion. A mol. ratio of $Na_2HgI_4$ to $(p\text{-}EtC_6H_4)_2Hg$ of 1:1 gave 97% conversion to $p\text{-}EtC_6H_4HgI$, while molar ratios of 2:1, 4:1 and 8:1 gave conversions of 98, 99 and 99.8%, resp. In the case of $p\text{-}MeC_6H_4HgX$, a moderate vol. of EtOH was as effective as a large vol.; the time of refluxing could be reduced to an approx. limit of 10 min. without cutting down the yield of $R_2X$. A new method for *Hg analysis* of org. Hg compds. is reported, which is particularly useful in detg. the proportions of $R_2Hg$ and RHgX in a mixt. of the 2. C. J. WEST

**Some reactions of tetra-*p*-tolyltin.** R. W. BOST AND H. R. BAKER. *J. Am. Chem. Soc.* **55**, 1112–13(1933).—$(p\text{-}MeC_6H_4)_4Sn$ reacts with halogens to form the corresponding aryl halides; with $HNO_3$ and $H_2SO_4$ to form $p\text{-}O_2NC_6H_4Me$ and PhMe, resp.; with S under different conditions to form $(p\text{-}MeC_6H_4)_2S_2$ and 3,7-dimethylthianthrene. No isomers were obtained with the halogens or $HNO_3$. Reactions of acyl and aryl halides are less marked. C. J. WEST

**Mechanism of the reduction of sulfonyl halides by phosphorus tribromide.** A. H. KOHLHASE. *J. Am. Chem. Soc.* **55**, 1291–2(1933); cf. *C. A.* **26**, 3783.—Reply to Hunter and Sorensen (*C. A.* **26**, 4793). C. J. WEST

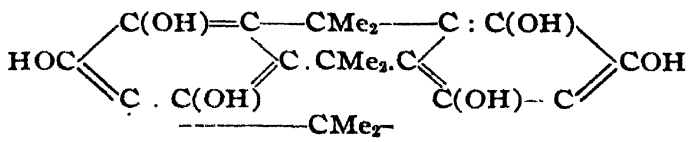
**The action of thionyl chloride on phenol.** P. CARRÉ AND D. LIBERMANN. *Compt. rend.* **196**, 275–7(1933); cf. *C. A.* **27**, 711.—Three mols. of PhOH and 2 mols. of $SOCl_2$ produce $(C_6H_4OH)_2SCl$ (I) and $(p\text{-}HOC_6H_4)_2S$ (II). II arises from the decompn. of I. The mechanism involves the formation of $HOC_6H_4SOCl$ which splits off HCl to give $O{:}C_6H_4{:}S{:}O$ (III). III reacts with 2 mols. of PhOH to give $O{:}C_6H_4{:}S(C_6H_4OH)_2$ (IV). IV reacts with HCl to give I. JULIUS WHITE



**Hydroxyphenyl alkyl sulfides.** ELLIS MILLER AND R. R. READ. *J. Am. Chem. Soc.* **55**, 1224–7(1933).—Hydroxyphenyl alkyl sulfides were prepd. by 2 general methods: BuBr is added to a mixt. of NaOH in MeOH and thiohydroquinone and the mass refluxed for 1 hr.; the yield is nearly quant *p*-Phenetidine is diazotized and run slowly beneath the surface of a hot soln. of BuSH in 20% NaOH and the resulting ether dealkylated with 20% HBr in AcOH. The following *hydroxyphenyl alkyl sulfides* (all *p*- but the last 2) are reported, the side chain on the phenol being given (p. c. is phenol coeff. by the Hygienic Lab. method, 20°, *Staph. aureus*): SMe, $b_6$ 113°, p. c. 8; SEt, $b_{13}$ 153–5°, m. 41°, p. c. 10; *SPr*, $b_{5-6}$ 150–3°, m. 37°, p. c. 36; *SBu*, $b_7$ 166–8°, m. 49–50°, p. c. 77; *SAm*, $b_{3-4}$ 164–8°, $b_{8-10}$ 175–80°, m. 59°, p. c. 120; $S(CH_2)_5Me$, $b_5$ 178–80°, $b_{16}$ 194–6°, m. 60°, p. c. 0 (230, in 1:1000 soln. in 0.01 *N* NaOH further dild. with $H_2O$); $SCH_2Ph$, $b_{15}$ 220–5°, m. 104°, p. c. 0 (<20 in NaOH); $SCHMe_2$, $b_{13}$ 150–2°, p. c. 20; $SCH_2CHMe_2$, $b_{10}$ 159–62°, p. c. 61; $SCH_2CH_2CHMe_2$, $b_3$ 150–2°, p. c. 30; *SBu-o*, $b_4$ 110–2°, p. c. 25; *SBu-m*, $b_4$ 127–40°, p. c. 40. The p. c. increases with increase in the length of the side chain; the normal-chain compd. is more active than the corresponding branched-chain derivs. The S derivs. are more powerful than the corresponding alkyl phenols. C. J. WEST

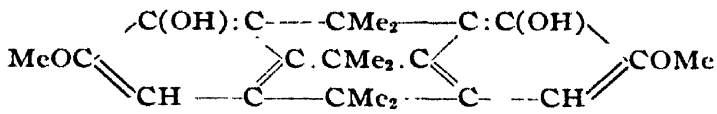
**New condensation reaction of the thiophenols.** GREGG DOUGHERTY AND WENDELL H. TAYLOR. *J. Am. Chem. Soc.* **55**, 1294–5(1933).—PhSH (I) and many substituted thiophenols, as well as $PhCH_2SH$, undergo condensation in boiling 1,4-dioxane with condensed ammonia-aldehydes, such as hexamethylenetetramine (II) and hydrobenzamide, to give substituted trimethylamines: I + II = $N(CH_2SPh)_3$ + $NH_3$. Details will be published later. C. J. WEST

**Nitration of *p*-cresol and of *p*-cresyl carbonate in the presence of sulfuric acid.** HOWARD J. LUCAS AND YUN-PU LIU. *J. Am. Chem. Soc.* **55**, 1271–80(1933).—Nitration of $p\text{-}MeC_6H_4OH$ (I) and $p\text{-}(MeC_6H_4)_2CO_3$ (II) has been carried out in the presence of $H_2SO_4$ in amts. varying from 0 to 10 mols. of acid per mol. of org. compd. In the case of I the ortho directive power of the HO group decreased as the amt. of $H_2SO_4$ increased, and more and more of the entering $NO_2$ group took up a position meta to the HO group. However, a max. value of about 0.8 was reached for the *m-o*-ratio. This change in directive power is ascribed to the salt-forming property of the O atom of I. The predominating tendency toward *o*-substitution, even when a large excess of acid is present, probably arises from the fact that the oxonium salt is in part unionized. In the case of II, increase in the amt. of $H_2SO_4$ likewise increased the *m-o*-ratio. It is assumed that here also oxonium salt formation is responsible for the change. These changes in orientation are entirely analogous to the modification in the orientation of $NH_2$ and substituted $NH_2$ groups by the addn. of $H_2SO_4$. The exptl. data are given in tables and curves. C. J. WEST



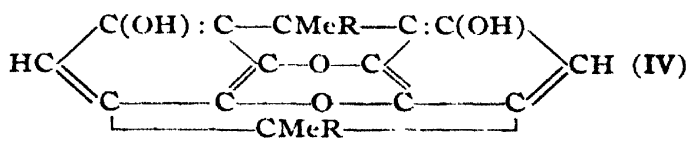
**New compounds prepared from phenols and acetone.** JÓZSEF SÜKÖSD. *Acta Lit. Sci. Univ. Hung. Francisco-Josephinae*, Sect. Chem., Mineral Phys. **2**, 230–40 (1932).—Condensation of *o*-cresol with acetone in the presence of 99% AcOH and concd. HCl formed a compd. which could be isolated by acetylation. The Ac product

m. 263–4°. Analysis gave the formula $C_{37}H_{32}O_4$. Its structural formula is **I.** The product from 1,3,4-$C_6H_3(OH)_3$ and acetone, treated as above, m. 267–8°. Its com-



(I)

bustion analysis gave data agreeing with the formula $C_{21}H_{24}O_6$. The structural formula is **II.** The Ac deriv. of **II**, $C_{33}H_{36}O_{12}$, grayish white, m. 205–6°, is insol. in water. The



(II)

propionyl deriv., $C_{39}H_{48}O_{12}$, gave light yellow crystals, m. 172.5°. The Bz deriv., $C_{63}H_{48}O_{12}$, m. 239–40°. Condensation of guaiacol with acetone gave white crystals, $C_{23}H_{28}O_4$, m. 266–7°. Its structure is expressed by the formula **III.** $AcCH_2CO_2Et$,

(III)

treated with 1,3,4-$C_6H_3(OH)_3$, gave light green crystals, $C_{20}H_{16}O_8$, m. 271°. Its formula is **IV** (R = $CH_2CO_2H$). Ac deriv., $C_{24}H_{20}O_{10}$, of **IV**, light brown, long needles, m. 148.5° Propionyl deriv. m. 115°.

S. S DE FINÁLY

**A new diketone, ketonic acid and some derivatives.** MARGIT K. OSKOLÁS. *Acta Lit. Sci. Univ. Hung. Francisco-Josephinae*, Sect. Chem., Mineral. Phys. **2**, 165–81(in German 182–5)(1932).—Asaroylformic acid, 2,4,5-$(MeO)_3C_6H_2COCO_2H$ (I), needles, m. 186°, prepd. from 1,3,4-$C_6H_3(OMe)_3$ and $(COCl)_2$ in abs. benzene, is sol. in alc., acetone, benzene, glacial AcOH and alkalies. The chloride of I changes in the air to I. Its bluish yellow crystals m. 125°. The amide of I, from the chloride and dry $NH_3$, is greenish yellow, m. 202°, sol. in alc., acetone, insol. in benzene, ligroin; anilide, from the chloride with $PhNH_2$ in benzene, yellow, m. 162°, sol. in alc., $CHCl_3$; *p*-toluide, m. 181°, sol. in alc., acetone and glacial AcOH. Me ester of I, from I and MeOH with concd. $H_2SO_4$, m. 137°, sol. in alc., benzene, glacial AcOH, $CHCl_3$ and ether; Et ester, m. 92°, sol. in alc., glacial AcOH, benzene and $CHCl_3$. Iso-Am ester, m. 65°, has the same solubilities as the Et ester. 2,4,5,2′,4′,5′-Hexamethoxybenzil, prepd. by mixing $CS_2$ solns. of 1,3,4-$C_6H_3(OMe)_3$ and $(COCl)_2$, treating with powd. $AlCl_3$ and distg. off the solvent, light yellow, m. 232°, sol. in $CHCl_3$. 2,4,5,2′,4′,5′-Hexamethoxybenzophenone, formed as a secondary product in the former reaction, yellow tablets, m. 147°, sol. in alc., acetone, benzene, $CHCl_3$ and glacial AcOH. Anisoylhydroxyhydroquinone tri-Me ether (2,4,5,4′-tetramethoxybenzophenone), prepd. by mixing cooled solns. of 1,3,4-$C_6H_3(OMe)_3$ and anisyl chloride and treating as above, yellow, m. 123.5°, sol. as above. ω-Chloro-2,4,5-trimethoxyacetophenone (II), prepd. by mixing cooled solns. of 1,3,4-$C_6H_3(OMe)_3$ and $ClCH_2COCl$ and treating as above, is an oil of unpleasant odor and light yellow color. The formulas and analyses of the compds. are given. Results of microanalyses proved the formulas, excepting for II where the oil could not be obtained free from $C_6H_3(OMe)_3$. S. S. DE FINÁLY

**Synthesis of ethylpyrogallol.** NÁNDOR MAUTHNER. *Math. naturw. Anz. ungar Akad. Wiss.* **48**, 478–82(in German 483–4)(1931).—3,4,5-Trimethoxyacetophenone was reduced according to Clemmensen with Zn-Hg. The Me groups were detached with HI. Ethylpyrogallol, m. 86–7°, is sol. in alc. and ether. The alc. soln. turned to violet with $FeCl_3$. Methylpyrogallol could not be obtained by the Zn-Hg reduction of trimethoxybenzaldehyde. S. S. DE FINÁLY

**Photochemical reactions in the series of *o*-nitrobenzylidene acetal derivatives. VI. The constitution of substances resulting from the photochemical isomerization of *o*-nitrobenzylidene acetals.** IOAN TANASESCU AND EUGEN MACOVSKI. *Bull. soc. chim.*

**51**, 1371–7(1932); cf. *C. A.* **24**, 4270.—Under the action of light the cyclic acetals of *o*-nitrobenzylidene compds. isomerize into nitroso derivs. with 2 possible structures, open-chain and cyclic (*C. A.* **19**, 2932; **20**, 749). Attempts to distinguish between these forms by methylation expts. failed by reason of the impurity of the products formed. Synthesis of glycol mono-*o*-nitrosobenzoate (*C. A.* **24**, 603) and proof of its identity with the isomer derived from *o*-nitrobenzylideneglycol (I) left the possibility of a tautomeric shift to be considered. The synthesis of the Bz deriv., which is not open to this objection, gave a benzoylated deriv. II is identical with the deriv. obtained by the direct benzoylation of the isomer formed photochemically from I. By heating 7.8 g. of benzoylated glycol bromohydrin (Auwers and Bergs, *Ann.* **332**, 209(1904)) with 8.6 g. of *o*-$ONC_6H_4CO_2Ag$ for 1 hr. at 70–80° and for 12 hrs. at 60–65°, extn. of the product with 95% alc. and recrystn. from benzene, 1-benzoyl-2-nitrosobenzoylglycol (II), $C_{16}H_{13}NO_5$, m. 112–3°, was formed. Accordingly the most adequate structure of the substances formed by the photochem. isomerization of *o*-nitrobenzylidene acetals is the open-chain type, *o*-$ROCH_2CH_2OCOC_6H_4NO$. Similar formulas are given for the photochem. isomers of various compds. previously studied, *viz.*, di-*o*-nitrobenzylidenepentaerythritolspiran (*C. A.* **24**, 1118), *o*-nitrobenzylideneglycerol and di-*o*-nitrobenzylideneerythritol (*C. A.* **20**, 749), tri-*o*-nitrobenzylidene-mannitol (*C. A.* **24**, 2429) and -sorbitol (*C. A.* **24**, 4270). Tautomerism is not, however, definitely excluded (*C. A.* **22**, 4467; **25**, 2973; **26**, 87), but whatever may be the structure of the isomers obtained by the isolation of the *o*-nitrobenzylidenepolyols the photochem. isomerization of these compds. presents the possibility of the partial acylation of the polyols since the OH group near the —$OCC_6H_4NO(o)$ group set free by isomerization is capable of initiating new sp. reactions—a fact which seems to have some importance in the study of glucides.

C. R. ADDINALL

**Reaction between unsaturated ketones and organic magnesium compounds. The secondary products.** E. P. KOHLER AND W. D. PETERSON. *J. Am. Chem. Soc.* **55**, 1073–82(1933); cf. *C. A.* **26**, 2724.—The Mg derivs. which are formed by the addn. of Grignard reagents to α,β-unsatd. ketones having no substituents in the α-position behave like the enolates of β-ketonic esters; like these enolates they combine with unsatd. ketones and with other substances that have sufficiently active CO groups. The reaction with acid chlorides results in the formation of *C*-acyl derivs. The Mg derivs. which are formed by adding Grignard reagents to α,β-unsatd. ketones which have hydrocarbon residues in the α-position combine neither with unsatd. ketones nor with aldehydes; they therefore do not form secondary products. The reaction between these Mg derivs and acid chlorides results in the formation of *o*-acyl derivs. The Mg deriv. of $Ph_2CHCHBrCOPh$ and PhCH:CHBz give *β-phenyl-γ-benzoyl-γ-benzohydrylbutyrophenone*, m. 180°; its *monoxime* m. 165° and in the Beckmann rearrangement gives the *anilide*, m. 198°, of *β-phenyl-γ-benzoyl-γ-benzohydrylbutyric acid*, m. 156°; Br in $CHCl_3$ gives *β-phenyl-γ-bromo-γ-benzoylbutyric acid*, m. 166°, and $Ph_2CHBr$; $Na_2CO_3$ gives *β-phenyl-γ-benzoylbutyrolactone*, m. 120°, which yields *β-phenyl-γ-hydroxy-γ-benzoylbutyric acid*, m. 146°. The secondary Mg deriv. $Ph_2CHCHBzCHPhCH:CPhMgBr$ reacts with BzCl to give a compd., $C_{43}H_{34}O_3$, m. 180°, which may be $Ph_2CHCHBzCHPhCHBz_2$. PhCH:CHAc gives *α-benzohydryl-β-phenyl-γ-acetylbutyrophenone*, m. 153°. BzH forms *α-phenyl-β-benzoyl-γ,γ-diphenylpropanol*, m. 133° (77% yield). $HCO_2Et$ gives *α,γ-dibenzoyl-α,γ-dibenzohydryl-β-hydroxypropane*, m. 202°; oxidation gives *α,γ-dibenzoyl-α,γ-dibenzohydrylacetone*, m. 232°. The Mg deriv. of $Ph_2CHCHPhCOPh$ and BzCl forms *α,β,γ,γ-tetraphenylpropenyl benzoate*, m. 110° and 131° (2 isomeric forms); hydrolysis leads to the original ketone. $PhCH_2COCl$ and PhBr with $AlCl_3$ give *p-bromodesoxybenzoin*, m. 115°; BzH and HCl give *α,β-diphenyl-β-chloro-p-bromopropiophenone*, m. 171°; AcOK and $Na_2CO_3$ give *benzal-p-bromodesoxybenzoin*, m. 105°; PhMgBr then gives *α-(p-bromophenyl)-β-benzohydryl-β-phenylethenyl benzoate*, m. 144°, hydrolyzed to *α,β,β-triphenyl-p-bromopropiophenone*, m. 200°. Benzaldesoxybenzoin and PhMgBr form *α,β-diphenyl-β-benzohydrylethenyl p-bromobenzoate*, m. 183°.

C. J. WEST

**Further observations on the behavior of vanillin substitution products; (a) the Perkin reaction; (b) the preparation of substituted vanillic acids.** L. CHAS. RAIFORD, VICTOR S. WEBSTER AND DWIGHT J. POTTER. *Proc. Iowa Acad. Sci.* **38**, 171(1931).—The Cl and Br substitution products of vanillin previously described (cf. *C. A.* **25**, 94) have been converted by the Perkin reaction into the corresponding cinnamic acids. When the latter are oxidized by alk. $KMnO_4$ they are converted into the original vanillin derivs. and not into the vanillic acids. To obtain the acids it has been necessary to hydrolyze the nitriles, which in turn were obtained from the oximes.

W. G. G.

**Unsaturated 1,4-dicarbonyl compounds. VII. Aryl unsaturated 1,4-diketones and ketonic acids derived from citraconic and mesaconic acids, with particular reference to the *β-p*-bromobenzoylmethylacrylic acids.** ROBERT E. LUTZ AND ROBERT J. TAY-

LOR. *J. Am. Chem. Soc.* **55**, 1168–78(1933); cf. *C. A.* **24**, 4774.—MeC(COCl):$CHCO_2Me$, PhBr and $AlCl_3$ give 60% of the Me ester, m 75.5° (all m. ps. cor.), of *trans-β-[p-bromobenzoyl]crotonic acid* (I), m. 144.5–5°, which results in 50% yield by hydrolysis in dil. MeOH; a by-product (22%) is *β-[p-bromobenzoyl]-α(?)-hydroxybutyric acid*, m. 85–6°; heating at 250° gives I. The acid chloride of I is a yellow oil. Citraconic anhydride, PhBr, $CS_2$ and $AlCl_3$ give 47% of the *cis-isomer* (II) of I, m. 142.5°, and 2% of *trans-β-*[bromobenzoyl]-*α*-methylacrylic acid. Citraconyl chloride gives 12.5% of II. The *Me ester* of II $b_4$ 156–8°. II and $PCl_5$ give 91% of *cis-γ-[p-bromophenyl]-γ-chloro-β-methylcrotonolactone* (III), m. 82.5°; hydrolysis gives II. Reduction of I or II gives *β-(p-bromobenzoyl)butyric acid*, m. 95.5°, showing that the 2 acids are stereoisomers. Hydrolytic splitting by $Ba(OH)_2$ gives $EtCOC_6H_4Br$. III and PhBr with $AlCl_3$ give the *compd.* $C_{17}H_{12}O_2Br_2$, m. 208°. ClCOCH:CMeCOCl, PhBr and $AlCl_3$ give 60% of *trans-β-[p-bromobenzoyl]-α-methylacrylic acid*, yellow, m. 188°; *Me ester*, m. 86°; *acid chloride*, m. 66°; reduction of the acid gives *β-[p-bromobenzoyl]-α-methylpropionic acid*, m. 124°. Citraconic anhydride, mesitylene and $AlCl_3$ in $CS_2$ give 36% of *trans-β-[2,4,6-trimethylbenzoyl]methylacrylic acid*, bright yellow, m. 142°; *Me ester*, yellow, $b_5$ 144.5°. Mesaconyl chloride (IV), $C_6H_6$, $AlCl_3$ and $CS_2$ give 72% of *trans-1,2-dibenzoyl-1-propene* (*dibenzoylmethylethylene*), very pale yellow, m. 52°; action of sunlight gives the *cis-isomer*, m. 68.5°. Both isomers are reduced to *1,2-dibenzoylpropane*, m. 105°. IV and mesitylene give *trans-1,2-bis(2,4,6-trimethylbenzoyl)-1-propene*, yellow, m. 96°. The *cis*-isomer could not be prepd. Br gives a *dibromide*, m. 176°, and a *monobromoethylene*, m. 134°. *trans*-Bromobenzoylcrotonyl chloride and $C_6H_6$ give 59% of *trans-1-benzoyl-2-bromobenzoyl-1-propene*, pale yellow, m. 73–4°; *trans-1-bromobenzoyl-2-benzoyl-1-propene*, cream, m. 56°. C. J. WEST

**Synthesis of benzoic acid from chlorobenzene, carbon monoxide and water.** VLADIMÍR MAREČEK. *Chem. Obzor* **7**, 171–3(173 English)(1932).—BzCl is synthesized from PhCl, CO and $H_2O$ in the presence of catalysts such as $Cu_2Cl_2$, active carbon, etc., under pressure and temp. above 300° conforming to the Nernst equation. Besides $C_6H_6$, HCl, $CO_2$, C and tarry products, BzOH is obtained in 3.9% yield. The best catalysts are $Cu_2Cl_2$ and active C. No $Ph_2CO$, $ClC_6H_4COPh$ or $Ph_2$ was observed in the reaction products. JAROSLAV KUČERA

**Reaction between acid chlorides and ethers in the presence of zinc chloride.** L. P. KYRIDES. *J. Am. Chem. Soc.* **55**, 1209–12(1933).—The chlorides of high-boiling monocarboxylic acids react with $Et_2O$, in the presence of traces of $ZnCl_2$. BzCl and $Et_2O$, with a trace of $ZnCl_2$, give 78% EtCl and 91.5% BzOEt. Lauryl chloride reacted similarly but very slowly with $Et_2O$ at its b. p. Equimol. amts. of *o*-$C_6H_4(COCl)_2$ and $Et_2O$ give $C_6H_4(CO)_2O$ and approx. 2 mols. EtCl; (iso-Pr)$_2O$ gives $C_6H_4(CO)_2O$, iso-PrCl (62%) and $C_3H_6$. C. J. WEST

**Percinnamic acid.** K. BODENDORF. *Ber.* **B66**, 165–6(1933).—Although per acids in general react with unsatd. compds. to form ethylene oxides, double bonds conjugated with a C:O group hardly react with $BzO_2H$ (*C. A.* **25**, 378). It was therefore to be expected that *α,β*-unsatd. per acids would be quite stable. Such proved to be the case with *percinnamic acid* (I), prepd. by treating $(PhCH:CHCO)_2O_2$ in $CHCl_3$ at 0° with Na in alc., taking up the Na salt of I in water after 0.5 hr., shaking out twice with $CHCl_3$, acidifying with $H_2SO_4$, extg. the I with $CHCl_3$, removing the $PhCH:CHCO_2H$ with $NaHCO_3$, drying over $Na_2SO_4$ and evapg. *in vacuo;* yield, about 80%. I is well crystd., m. 67–8° (decompn.), and is as stable as $BzO_2H$; it remains unchanged for days in benzene and even at 50° it decomps. only 12% in 24 hrs.; after boiling several days the soln. contains only $PhCH:CHCO_2H$ with a little resinous matter but no phenylglycidic acid or $PhCH_2CO_2H$. C. A. R.

***α*-Phenyl-*γ*-hydroxybutyric acid and its lactone.** P. CARRÉ AND D. LIBERMANN *Compt. rend.* **196**, 117–8(1933).—The Na deriv. of $PhCH_2CN$, heated with $ClCH_2CH_2OH$, gives *α-phenyl-γ-hydroxybutyronitrile*, $b_{10}$ 188–90°; *phenylurethan*, m. 89°. Hydrolyzed with 20% $Ba(OH)_2$ the nitrile gives an impure acid, which on distn. gives *α-phenyl-γ-hydroxybutyrolactone*, $b_{30}$ 203–5°. The *acid*, m. 99–100°, may be obtained from the lactone by dissolving it in dil. NaOH and adding dil. HCl in the cold. A. H

**Condensation of chloral with 2-hydroxy-*p*-toluic acid and its methyl ether.** A. N. MELDRUM AND B. M. KAPADIA. *J. Indian Chem. Soc.* **9**, 483–91(1932).—M. and K. study the condensation of 2-hydroxy-*p*-toluic acid with chloral and extend the application of the method to obtain phenylacetic acids. The toluic acid when condensed with chloral yielded *3-hydroxy-4-methyl-α-trichloromethylphthalide* (I), m. 232°; *Ac deriv.*, m. 142°; *Bz deriv.*, m. 154°. Reduction of I with Zn and AcOH gave *3-hydroxy-4-methyl-2-β,β-dichloroethylbenzoic acid* (II), m. 184°; *Ac deriv.*, m. 185°; *Bz deriv.*, m. 140°. Upon hydrolysis and oxidation with concd. $H_2SO_4$ II gave *2-hydroxy-3-methyl-6-carboxyphenylacetic acid* (III), m. 213°; *Ac deriv.*, m. 110°; *Bz deriv.*, m. 126°; *MeO deriv.*, m. 206°. Heating I with NaOH gave *2-hydroxy-6-carboxy-3-methylmandelic*

*acid*, m. 115°. Condensation of III with chloral gave *2-hydroxy-3-methyl-6-α-trichloromethylphthalidephenylacetic acid* (IV), m. 249°. By the use of $H_2SO_4$, II can also be converted into IV, but the yields are poor. The action of NaOH on IV gave *2-carboxy-3-carboxymethyl-4-hydroxy-5-methylmandelic acid*, m. 246°, while reduction of IV with Zn and AcOH gave *2-hydroxy-3-methyl-5-β,β-dichloroethyl-6-carboxyphenyl-1-acetic acid* (V), m. 203–5°, which, when acted upon by $H_2SO_4$, gave *2-hydroxy-3-methyl-6-carboxyphenylene-1,5-bisacetic acid* (VI), m. 220°. Condensation of chloral with 2-methoxy-*p*-toluic acid gave *5-methoxy-4-methyl-α-trichloromethylphthalide* (VII), m. 132°, and upon treating this with NaOH *5-methoxy-4-methyl-α-carboxyphthalide*, m. 220°, was obtained. Reduction of VII with Zn and AcOH yielded *5-methoxy-4-methyl-2-β,β-dichloroethylbenzoic acid* (VIII), m. 195°. VIII on treatment with concd. $H_2SO_4$ yielded *3-methyl-4-hydroxy-6-carboxyphenyl-1-acetic acid* (IX), m. 209°; *Bz deriv.*, m. 170°. Treating IX with KOH and $KMnO_4$ gave *4-hydroxy-5-methylphthalic acid*, m. 244–5°. Condensation of IX with chloral, using 100% $H_2SO_4$, gave 2 compds. A and B. A is *3-hydroxy-4,6-dimethylbenzoic acid*, m. 170–1° (*Ac deriv.*, m. 134°); while B is a polymer of chloral, m. 120°. It is concluded that since the acids III and IX are different and since the chloral mol. in MeO compd. is attached to the benzene ring in the *p*-position to the MeO group, the linking in the HO compd. must be in the *o*-position. H. W. LEAHY

**Condensation reactions of pernitrosocamphor with the primary amines.** P. LATINI. *Ann. chim. applicata* **22**, 728–30(1932); cf. *C. A.* **26**, 3788, 3789.—Using the same technic as previously described, a condensation product of pernitrosocamphor with *m*-$BrC_6H_4NH_2$ has been obtained. It is a yellow oily liquid, $b_{700}$ 236°, sol. in all common org. solvents and mineral acids, insol. in $H_2O$ and alkalies. *o*-$BrC_6H_4NH_2$ could not be condensed; the *p*-compd. described in the previous paper is formed most readily. Thus the influence of a neg. group in hindering the reaction is shown, the action being weakest with the compd. whose group is furthest away (*p*-), and strongest with the *o*-compd. More strongly neg. groups hinder the reaction still more strongly; thus the nitroanilines would not react at all. A. W. CONTIERI

**Halogenation of *m*-diphenylbenzene. I. Monochloro and monobromo derivatives.** WALTER A. COOK AND KATHRYN HARTKOFF COOK. *J. Am. Chem. Soc.* **55**, 1212–17(1933).—1,3-$C_6H_4Ph_2$ (I) and Cl with Fe catalyst gives 84.2% of the *4-Cl deriv.*, $b_4$ 214–16°, $d_{25}^{25}$ 1.1903, $n_D^{25}$ 1.6564; oxidation gives *3-phenyl-4-chlorobenzoic acid* (II), m. 208–9° (*Ag salt*; *Me ester*, yellow, pungent oil, $n_D^{30}$ 1.5952; *benzyl ester*, m. 90°). 3,4-$H_2N(Cl)C_6H_3Me$ gives 15% of *2-chloro-5-methylbiphenyl*, $b_{735}$ 294–304°, $d_{25}^{25}$ 1.139, $n_D^{25}$ 1.5977; oxidation gives II. The *4-Br deriv.* of I $b_1$ 208–13°, $d_{25}^{25}$ 1.355, $n_D^{25}$ 1.6720, $n_D^{30}$ 1.6653; oxidation gives 3,4-$PhClC_6H_3CO_2H$ (III), m. 242–3° (Olgiati, *Ber.* **27**, 3385(1894)). *3-Amino-4-bromotoluene*, $b_{16}$ 129–30°, $d_{25}^{25}$ 1.474, $n_D^{25}$ 1.5990 (*Ac deriv.*, m. 120–1°; *Bz deriv.*, m. 107.5–8.5°); discordant data concerning the amine are discussed. *2-Bromo-5-methylbiphenyl*, yellow, $b_{740}$ 304–8°, $d_{25}^{25}$ 1.358, $n_D^{25}$ 1.6150 (16% yield); oxidation gives III. *3-Methyl-4-bromobiphenyl*, $b_{760}$ 318–23°, $n_D^{25}$ 1.6358; no oxidation product could be isolated. An improved method for the purification of acids obtained on oxidation of liquid halogenated aromatic hydrocarbons with $CrO_3$ and AcOH is suggested. C. J. WEST

**Some aspects of the chemistry of biphenyl.** E. E. TURNER. *Sci. J. Roy. Coll. Sci.* 2, 68–78(1932).—A review. E. H.

**Formation of aromatic ethers from *p*-nitrofluorobenzene.** MORGAN J. RARICK, R. Q. BREWSTER AND F. B. DAINS. *J. Am. Chem. Soc.* **55**, 1289–90(1933).—The substitution of *p*-$FC_6H_4NO_2$ (I) for *p*-$ClC_6H_4NO_2$ in the older method of prepn. of aromatic ethers results in a more rapid reaction and usually also a better yield. I (7 g.) and 3 g. KOH in 20 cc. warm MeOH, shaken 10 min., give 93% of *p*-$O_2NC_6H_4OMe$; other alcs. behaved similarly. KOH (3 g.) in 15 g. molten PhOH, treated with 7 g. I and heated 30 min. at 150–60°, gives 92% *p*-$O_2NC_6H_4OPh$; other phenols gave corresponding yields. Dry *p*-$O_2NC_6H_4OK$, I and Cu powder, heated 1 hr. at 200°, give 85% of $(p\text{-}O_2NC_6H_4)_2O$; *o*-$O_2NC_6H_4OK$ gave 30% of ether. The following new *p-nitrophenyl ethers* are reported: *iso-Pr*, $b_{738}$ 276–7°; *phenylethyl*, m. 56–7°; *m-tolyl*, m. 63°; *o-iodophenyl*, m. 105°; *p-phenylphenyl*, m. 120°; *p-tert-amylphenyl*, m. 60°; *p-acetamidophenyl*, m. 153°; *m-nitrophenyl*, m. 123°; *2-(4-nitrophenoxy)benzaldehyde*, m. 112°. C. J. WEST

**Molecular rearrangements of α-glycols. VI. Relative electronegativities of *p*-anisyl and naphthyl radicals.** MASAO MIGITA. *Bull. Chem. Soc. Japan* **7**, 377–82 (1932); cf. *C. A.* **27**, 716.—M. dets. the relative electronegativities of *p*-anisyl and naphthyl radicals by the method of the mol. rearrangements of sym. pinacols. The rearrangement of *sym-di-p-anisyldi-β-naphthylglycol* (I) was first studied. Migration of the anisyl radical takes place exclusively in the case of I, forming *di-p-anisyl-β-naphthyl-β-naphthoylmethane*. This shows that the *p*-anisyl is far more neg. than the β-naphthyl radical. **VII. Relative electronegativities of β-naphthyl and biphenylyl**

**radicals.** *Ibid* **7**, 382–8(1932).—The rearrangement of sym. di-β-naphthylbisbiphenylylglycol was studied. On hydrolyzing the rearrangement product, both β-naphthoic acid and *p*-phenylbenzoic acid were obtained. M. concludes from the results that the migration of β-naphthyl and biphenylyl radicals occur to an equal extent.

H. W. LEAHY

**Fluorenone. II.** ANUKUL C. SIRCAR AND KSHITISH C. BHATTACHARYYA. *J. Indian Chem. Soc.* **9**, 521–6(1932); cf. *C. A.* **26**, 2867.—The tetrazo deriv. of 2,7-diaminofluorenone, coupled in the standard way, gives *fluorenone-2,7-bisazo derivs.* of the following: *PhOH*, deep brown; *m*-$C_6H_4(OH)_2$, dark brown; *o*-$HOC_6H_4CO_2H$, deep brown; *β-naphthol*, deep brown; *2-hydroxy-3-naphthoic acid* (I), brownish violet; *1,4-naphthylaminesulfonic acid* (II), red; *1,4-naphtholsulfonic acid*, deep reddish brown; *2,3,6-naphtholdisulfonic acid*, reddish violet; *2,6,8-naphtholdisulfonic acid*, brownish violet; *1,6-naphthylaminesulfonic acid*, deep brown; *1,5-naphthylaminesulfonic acid*, deep brown; *1-hydroxy-8-aminonaphthalene-3,6-disulfonic acid*, deep brown; *2,6-naphtholsulfonic acid*, violet; *2-amino-8-naphthol-6-sulfonic acid*, deep brown; *1,8-dihydroxynaphthalene-3,6-disulfonic acid*, bluish violet; *PhNMe*$_2$ (III), deep brown. All compds. m. above 290°, are sol. in $H_2SO_4$ and are pptd. unchanged by $H_2O$. All except I, II and III are substantive to cotton. 2-Iodofluorenone (IV) was prepd. from the amino compd. via the diazonium reaction. IV and Cu at 150–350° did not give 2,2′-bifluorenonyl.

A. F. SHEPARD

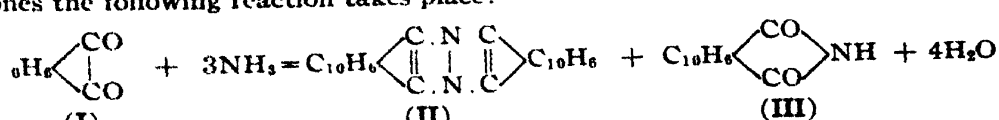
**Metallic cerium in organic syntheses.** JAGARAJ BEHARI LAL AND SIKHIBHUSHAN DUTT. *J. Indian Chem. Soc.* **9**, 565–71(1932).—Diverse org. compds. were submitted to dry distn. with Ce powder in a current of pure $H_2$ (*C. A.* **23**, 822). The results are summarized in a table giving the temp. of distn., main product (with yield) and by-products. Friedel and Craft's reaction, with Ce powder in the presence of benzene, transformed $PhCHCl_2$, BzCl, $PhCCl_3$, PhX (X = Br, Cl and I), $CHCl_3$ and *o*-$C_6H_4(COCl)_2$ into $Ph_2CH$, $Ph_3COH$, $Ph_3CCl$, $Ph_2$, $Ph_3CH$ and $C_6H_4(CO)_2C_6H_4$, resp., while under the same conditions BzCl and $PhCO_2H$ yielded $BzC_6H_4CO_2H$. PhCH:CHCOPh was similarly prepd. from $PhCHCl_2$ and MeCOPh. With Ce powder Zincke's reaction gave $Ph_2CH_2$ from benzene and $PhCH_2Cl$. Similarly, from $PhCH_2Cl$ and PhMe were produced $(PhCH_2)_2$ and $PhCH(CH_2Ph)_2$; from $PhCH_2Cl$ with anisole, phenetole, quinol di-Me ether and PhOH were formed anisylphenylmethane, phenetylphenylmethane, benzylquinol di-Me ether and *p*-benzylphenol; AcCl and benzene gave MeCOPh while $Ph_2CO$ was made from BzCl and benzene. Reformatski's reaction was carried out by refluxing a mixt. of MeCOPh (12 g.), $CH_2ClCO_2Et$ (12 g.), Ce (10 g.) and dry benzene (70 g.) with the addn. of a minute crystal of $I_2$, for 2 hrs. The product was treated with ice-cold dil. HCl, washed with NaOH and with $H_2O$, dried and fractionated at 5 mm. The 112–30° fraction (redistd. at 118–20°) was β-phenylmethylhydroxypropionic ester (6.1 g.). With $CH_2BrCO_2Et$ the yield was 9.3 g. By the substitution of Ce for Cu in Ullmann's method $(CH_2CO_2Et)_2$ was formed from $CH_2ClCO_2Et$ and AcOEt, $(CH_2)_4(CO_2H)_2$ from $ICH_2CH_2CO_2H$ and $Ph_2$ from PhX (X = Br, Cl and I). PhBr yielded $Ph_2O$ with PhOH and $Ph_2NH$ with $PhNH_2$. Heating a mixt. of $ClCH_2CO_2Na$ (11.5 g.), anhyd. $MeCO_2Na$ (8 g.) and Ce (4 g.) at 110–20° for 1 hr. gave on working up 2.9 g. of $(CH_2CO_2H)_2$. Neutral reduction by vigorous shaking with Ce in the presence of $NH_4Cl$ transformed $C_6H_3(NO_2)_3$ into a mixt. of picramic acid (85%) and $(H_2N)_3C_6H_2OH$ in 5 hrs. and into a 63% yield of the latter in 10 hrs. In the same way methyl orange was completely reduced to sulfanilic acid and $PhNMe_2$. By a similar procedure *o*-$O_2NC_6H_4OH$, $Ph_2CO$, $PhNO_2$ and *p*-$O_2NC_6H_4Me$ were converted into *o*-$H_2NC_6H_4OH$, $Ph_2CHOH$, $PhNH_2$ and *p*-$H_2NC_6H_4Me$.

C. R. ADDINALL

**Heteropolar compounds. XIX. Phenoxy, phenothio and phenoseleno groups as auxochromes in triphenylcarbenium salts.** W. DILTHEY AND F. HARENBERG. *J. prakt. Chem.* **136**, 49–74(1933); cf. *C. A.* **26**, 5938.—*4,4′-bis(4-ethoxyphenoxy)benzophenone*, from 4-$EtOC_6H_4OPh$ and $COCl_2$ with $AlCl_3$ in $CS_2$, pale yellow, m. 167°; concd $H_2SO_4$ gives a greenish yellow soln.; the *4-MeO analog* m. 198–9° and gives the same color in $H_2SO_4$. *4-(4-Methoxyphenoxy)benzophenone*, m. 104–5°; $AlCl_3$ in $C_6H_6$ splits off the MeO group, giving the *4-HO deriv.*, m. 109°; both give greenish yellow solns. in $H_2SO_4$. *4,4′-Diphenoxybenzophenone*, m. 147°, from $(4\text{-}BrC_6H_4)_2CO$ and PhOK. PhSK gives *4,4′-diphenothiobenzophenone*, m. 139° and giving a red soln. in concd $H_2SO_4$. *4,4′-Bis(4-hydroxyphenoxy)benzophenone*, m. 214°; *Ac deriv.*, m. 177–8°. *4,4′-Bis(4-ethoxyphenothio)benzophenone*, m. 170–1°; the *MeO analog* m. 121–2°; both give orange-red solns. in $H_2SO_4$. *4,4′-Bis(4-nitrophenoxy)benzophenone*, yellow, m. 150–1°, greenish yellow in $H_2SO_4$. 4-Phenoxytriphenylcarbenium perchlorate is unstable in the solid state. *4,4′-Diphenoxy deriv.*, orange-red, decomps. 130–2°; *4,4′,4″-triphenoxy deriv.*, red, m. 236–8°. *4-Phenothiotriphenylcarbenium perchlorate*, unstable; *4,4′-diphenothio deriv.*, blue with green luster, m. 190° (decompn.); *4,4′,4″-triphenothio deriv.*, dark blue, m. 145°. *4,4′,4″-Triphenothiotriphenylmethane*, m. 105–6°

The corresponding Se compds. could not be isolated. The influence of these groups on color is discussed. C. J. WEST

**Reaction of aromatic ketones with sodium. I. The structure of the so-called metal ketyls.** W. E. BACHMANN. *J. Am. Chem. Soc.* **55**, 1179–88(1933).—The products obtained by the action of Na on aromatic ketones in anhyd. $Et_2O$ are chiefly Na pinacolates, $R_2C(ONa)(NaO)CR_2$ and not free ketyl radicals, $R_2CONa$, existing in the monomol. state, as has been supposed up to this time. Hydrolysis of the Na pinacolates with dil. acid gives pinacols in excellent yields. In order to account for the reactions of the pinacolates with certain reagents it is assumed that the pinacolate is in equil. with small amts. of ketyl radicals, $2R_2CONa \rightleftharpoons R_2C(ONa)(NaO)CR_2$. The ketyl radicals are intermediates in the reduction of the ketone to the pinacolate. Other metals such as Li, K, Rb, Cs, Be, Mg and Ca react in the same manner as of Na. In all cases products are metal pinacolates, which differ from the Na pinacolate and from each other only in degree. The yield of benzopinacol from $Ph_2CO$ with Na-Hg is 86%; with Ca-Hg 87%; with Mg-Hg 80%. Fluorenone (I) gives with Na 95% pinacol (II); 30% excess of Na gives 75% II, 24% of fluorenol and 1% I. 2,2′-Dibenzoylbiphenyl and Na-Hg give 73% of 9,10-diphenyldihydrophenanthrenediol, m. 202°, and 27% of the isomer, m. 178–9°. 4-$PhC_6H_4Bz$ and 2% Na-Hg give 90% of 4,4′-diphenylbenzopinacol; $(4\text{-}PhC_6H_4)_2CO$ gives 70% of 4,4′,4″,4‴-tetraphenylbenzopinacol. C. J. WEST



**Spontaneous resolution into active isomers of 4-methoxy-*ms*-methyldesoxybenzoin.** MME. BRUZAU. *Compt. rend.* **196**, 122–4(1933).—*p*-$MeOC_6H_4COCHMePh$ was prepd. in 3 ways: from the Na deriv of *p*-$MeOC_6H_4COCH_2Ph$ and MeI (*Ber.* **21**, 2450(1888)); from *p*-$MeOC_6H_4MgBr$ and $PhCHMeCONH_2$; and from PhCHMeCOCl, PhOMe and $AlCl_3$. In all cases a mixt. of 2 substances was obtained, m. 58–60° and 78–80°. The latter consisted of right- and left-handed prisms, which could be sepd. manually: $[\alpha]_J^{16}$ ±145°, $[\alpha]_V^{16}$ ±170°, $[\alpha]_I^{16}$ ±357°. The lower-melting portion seems to be a mixt. of the two. By similar methods *4-methyl-ms-methyldesoxybenzoin*, m. 46–7°, was prepd. This did not resolve spontaneously, nor did PhCHMeCOPh. A. H.

**Tetralin peroxide.** M. HARTMANN AND M. SEIBERTH. *Helv. Chim. Acta* **15**, 1390–2(1932).—Oxidation of tetralin (I) by standing in contact with air, or catalytic oxidation in the presence of metals or metallic compds. by passing air through I results in the formation of the *peroxide*, $C_6H_4.CH(OOH).CH_2\ CH_2.CH_2$ (II), m. 53–4°.

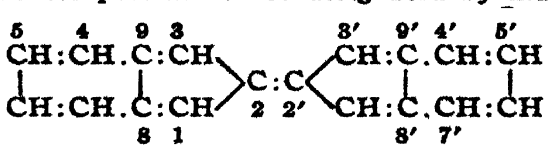
II is easily sol. in most org. solvents, insol. in $H_2O$, sol. in dil. alkalies from which it is repptd. on acidification, liberates $I_2$ from KI in HOAc and is reduced in 50% HOAc by Zn dust to α-tetralol. L. F. A.

**Preparation of agents to be used against malaria.** JNANENDRA NATH RÂY, GURCHARAN SINGH AHLUWALIA AND BASHESHAR DAS KOCHHAR. *J. prakt. Chem.* **136**, 117–19(1933).—2,1-$AcC_{10}H_6OH$ and *o*-$O_2NC_6H_4CHO$ in EtOH-NaOH give *2-(8-nitrobenzylideneaceto)-1-naphthol* (I), scarlet-red, m. 218°; *Me ether*, m. 127°; *2-(6-nitro-3,4-methylenedioxybenzylideneaceto)-1-naphthol*, m. 205°; *2-(6-nitro-3,4-dimethoxybenzylideneaceto)-1-naphthol*, m. 245°; *Me ether*, m. 202°. Reduction of I in EtOH-EtOAc with Sn and $SnCl_2$ in HCl gives *1-α-hydroxynaphthylquinoline*, m. 150°; *Me ether*, m. 105°; *6,7-methylenedioxy-2-α-hydroxynaphthylquinoline*, m. 235°; *6,7-di-MeO deriv.*, m. 170°. C. J. WEST

**The action of ammonia on acenaphthenequinone.** G. CHARRIER AND ELISA GHIGI. *Atti accad. Lincei* **16**, 262–5(1932).—When $NH_3$ gas or soln. reacts with *o*-quinones the following reaction takes place:

(I) (II) (III)

Acenaphthazine (II), a deep red dye, was shown to be identical with the compd. of Graebe and Gfeller (*Ann.* **276**, 9(1893)), while III, a white cryst. compd., m. 300°, insol. in acids, sol. in hot alkali from which the salt seps. on cooling, is naphthalimide. This was confirmed by prepg. its anhydride, which m. 274°. Phenanthrenequinone, *2 phenyl-α,β-naphtho-1,2,3-triazolequinone* and β-naphthoquinone also have been shown to give 2 products having characteristics similar to the above compds. II and III. These are being studied further. A. W. CONTIERI



**Aromatic hydrocarbons. XIX. A regularity in the absorption spectra of aromatic hydrocarbons.** E. CLAR. *Ber.* **B66**, 202–8(1933); cf. *C. A.* **27**, 84.—A study of the extinction curves of anthracenes has shown that the 9,10-diyl (diradical) state may produce not only one band but a series of bands. The distance between these bands varies

with their position in the spectrum but if two different anthracenes have 1 band at the same wave length the distance to the next band is the same in both cases, *i. e.*, every band of a 9,10-diyl series is followed by another at a definite distance, depending on the position of the first. This rule holds for a large no. of simple anthracenes and their benzo homologs. The distances between the bands decrease almost linearly with the decrease in wave length. This rule is especially useful when applied to complicated extinction curves. It had been shown (*C. A.* **26**, 5946) that the assumption of a 9,10-diyl state for phenanthrene does not suffice to explain its chem. behavior and its extinction curve, and that the side nuclei are also activated. The assumption of 2 diyl states requires the presence of 2 series of bands, and its spectrum is, in fact, composed of 2 series: the 1st, 3rd and 5th bands at 345, 329 and 314 $\mu\mu$, and the 2nd and 4th bands at 337 and 322 $\mu\mu$. The 2 series generally differ in intensity; in some cases this difference may be so great that only 1 of the series is detectable. With the naphthalenes, too, both the chem. and the optical properties require the assumption of 2 diyl states, and the extinction curve of benzene indicates that it also can be optically effective in at least 2 states, presumably an *o*- and a *p*-diyl state. If the distances between 2 successive bands are plotted against the wave lengths of the 1st band of each pair, there is obtained a curve from which can be read the av. distances between bands of the same series, and the deviations from the rule are so small that series of bands produced by different diyl states can readily be distinguished from each other and definite conclusions can be drawn as to the structure of a given hydrocarbon. C. A. R

**Azlactone from 6-aldehydocoumarin and its condensation with some aromatic amines.** SANAT K. BANERJEE. *J. Indian Chem. Soc.* **9**, 479–81(1932).—The investigation was undertaken with the object of synthesizing *phenanthracoumarin* from *6-aldehydocoumarin* (I). On condensing I with hippuric acid the *azlactone* (II), m. 245°, was obtained. Alk. hydrolysis of II gave *coumarin-6-pyruvic acid* (III). The acid when oxidized with $H_2O_2$ in alk. soln. was expected to yield the coumarin-6-acetic acid. This being condensed with *o*-$O_2NC_6H_4CHO$ by Pshoor's method would yield phenanthracoumarin. The formation, however, of the expected keto acid (III), as one of the products of the hydrolysis of II has been qualitatively established by its condensation with *o*-$C_6H_4(NH_2)_2$. The quinoxalino compd. thus obtained m. 288–90°. Condensation of II with *p*-toluidine gave $C_9H_5O_2CH{:}C(NHBz)CONHC_6H_4Me$, m. 258°. Condensation with $\alpha$-$C_{10}H_7NH_2$ gave $C_9H_5O_2CH{:}C(NHBz)CONHC_{10}H_7$, while the condensation with aniline gave $C_9H_5O_2CH{:}C(NHBz)CONHPh$, m. 178–80°. H. W. L.

**Synthesis of 1,2,7-trihydroxy-5-methylanthrone-8-carboxylic acid.** PRAFULLA K. PAUL. *J. Indian Chem. Soc.* **9**, 493–7(1932).—P. attempted the synthesis of anthrones composed of a *m*-cresotic acid residue and a polyhydric phenol residue, which on oxidation might produce *cochenillic acid* and thus definitely settle its constitution. With this end in view 3,4,5-trimethoxy-, 6-methyl-3,5-dimethoxy- and 3,6-dimethoxy-1,2-phthalide (I) were condensed with Et methoxy-*m*-cresotate (II) in the presence of $AlCl_3$. Partly demethylated benzylbenzoic acid derivs. were obtained. Only a very poor yield of anthrone deriv. could be obtained by condensing I and II, but on demethylation with HBr and AcOH it gave *1,2,7-trihydroxy-5-methylanthrone-8-carboxylic acid* (III), m. 255°. Attempts to oxidize III with alk. $H_2O_2$ met with failure. Opianic acid was then condensed with Et *m*-cresotate to a product m. 93°, which on hydrolysis with 10% KOH and subsequent reduction with Zn gave the *benzylbenzoic acid deriv.*, m. 183°. The *neutral methoxymethyl ester*, m. 101°, was prepd. and found to be identical with the condensation product of I and II. The proper conditions for ring closure to yield an anthrone deriv. have not yet been found. H. W. LEAHY

**Proposed nomenclature of rubrenes considered as derivatives of a prototype, rubene.** CHARLES DUFRAISSE. *Bull. soc. chim.* **51**, 1486–90(1932).—The name "rubene" is proposed for the simplest member of the series, a dibenzobifulvene (I) as yet unknown. Other compds. are to be designated by indicating the position of

the substituents by a numerical scheme borrowed from that of indigo with the sole difference that the C atoms common to the 5- and 6-membered rings are numbered 8 and 9. According to this nomenclature the compd. now known as rubrene becomes 1,1',3,3'-tetraphenylrubene and rubrene monoxide, 1,1',3,3'-tetraphenyl-1,1'-epoxy-1,1'-dihydrorubene. Other examples (10) are given. C. R. ADDINALL

**Furan reactions. IV. Furoic acid from furfural.** CHARLES D. HURD, J. W. GARRETT AND E. N. OSBORNE. *J. Am. Chem. Soc.* **55**, 1082–4(1933); cf. *C. A.* **26**,

3792.—In the Cannizzaro reaction with furfural the excess of alkali is neutralized with furoic acid and the furfuryl alc. sepd. directly; the yields of acid and alc. are 73–6 and 72–6%, resp. The excess of alkali may be omitted altogether with yields only slightly lower. Oxidation of furfural by $K_2Cr_2O_7$ and $H_2SO_4$ give 75% of furoic acid. *Mn furoate*, crystals with 3 mols. $H_2O$; the $H_2O$ is lost at 105° and the anhyd. salt begins to decomp. at 290°. **VI. Cyclopropene.** CHARLES D. HURD AND FORREST D. PILGRIM. *Ibid* 1195–7(1933); cf. *C. A.* **27**, 979.—Attempts to prep. cyclopropene by Freundler's method, the dry distn. of a mixt. of Ba furoate or Ca furoate with soda lime, gave negligible yields. MeC:CH was identified as a reaction product but also in small amts. Considerable furan was formed. Allyl alc. was produced as a result of the action of Mg upon epibromohydrin. $(BrCH_2)_2CHOH$ and BzCl give 66% of *β,β'-dibromoisopropyl benzoate*, $b_{16}$ 185°, does not solidify at —30°, $d^{23.5}$ 1.6324, $n_D^{17}$ 1.5749, $n_D^{23.6}$ 1.5658.

C. J. WEST

**Furfural and carbon dioxide formation from uronic acids.** H. FRANKEN. *Biochem. Z.* **257**, 245–55(1933); cf. *C. A.* **26**, 5074.—The formation of furfural from uronic acids in the presence of mineral acids proceeds at least partly over the corresponding pentose. When Ba galacturonate is treated under pressure with steam a substance is formed which on oxidation yields succinic acid. In the reaction of galacturonic acid with boiling mineral acids there is a simultaneous production of $CO_2$ and furfural but partly, and in the absence of $CO_2$, also pentanon-4-al-5-oic acid is formed as an intermediate product.

S. MORGULIS

**Preparation of furil.** W. W. HARTMAN AND J. B. DICKEY. *J. Am. Chem. Soc.* **55**, 1228–9(1933).—Details are given of the prepn. of furoin in 37.5% yields and of its oxidation with $CuSO_4$ to furil in 63% yield.

C. J. WEST

**Synthesis of several *p*-substituted β,β-furyalkyl- and furylarylpropiophenones.** NICOLAS MAXIM AND J. ANGELESCO. *Bull. soc. chim.* **51**, 1365(1932).—The reaction between the Grignard reagent and various furalacetophenones (substituted in the benzene nucleus) takes place by 1,4-addn. to the ends of the conjugated system (Kohler, *Am. Chem. J.* **34**, 153(1905)) to give satd. ketones and not unsatd. alcs. Substitution by Cl and Br favor the reaction more than by Me. The following *p*-substituted furalacetophenones were prepd. by the addn. of 10% NaOH to a mixt. of furfural with the requisite substituted acetophenone in the presence of EtOH: Me (I) ($C_4H_3OCH:CHCOC_6H_4Me$), Cl (II), m. 78° and Br (III), m. 81°. Treatment of I with MeMgI and RMgBr (R = Et, iso-Pr, iso-Bu and Ph) gave the corresponding *β,β-furylalkyl(aryl)-p-methylpropiophenones*, $C_4H_3O(R)CHCH_2COC_6H_4Me$: Me, $b_{12}$ 170° (56%) (*semicarbazone*, m. 166°); *Et*, $b_{11}$ 175° (*semicarbazone*, m. 152°); *iso-Pr*, $b_{13}$ 188° (80%) (*semicarbazone*, m. 148°); *iso-Bu*, $b_{12}$ 191° (70%); and *Ph*, $b_{19}$ 252° (80%). EtMgBr with II and III gave 95% yields of $C_4H_3OCHEtCH_2COC_6H_4Cl$, $b_{10}$ 197° (*semicarbazone*, m. 118°), and $C_4H_3OCHEtCH_2COC_6H_4Br$, $b_{10}$ 207° (*semicarbazone*, m. 138°), resp.

C. R. ADDINALL

**Stereochemistry of *N*-phenylpyrroles. XXIX. Preparation and properties of *o*-*N*-carbazyl- and *o*-*N*-[3-nitrocarbazyl]benzoic acid.** W. I. PATTERSON AND ROGER ADAMS. *J. Am. Chem. Soc.* **55**, 1069–72(1933); cf. *C. A.* **27**, 1339.—*o*-Carbazylbenzoic acid, m. 184°, gives a *brucine salt*, m. 214–5°, $[\alpha]_D^{25}$ 18.2°; no resolution was observed after many trials. The *strychnine*, *morphine*, *quinine* and *dicinchonine salts* were also prepd., and had $[\alpha]_D^{25}$ —16.4°, —54.0°, —26.5° and 166.2°, resp. *o*-(3-Nitrocarbazyl)-benzoic acid was resolved through the brucine salt, lemon, m. 246–7°, $[\alpha]_D^{20}$ —10.44° (1.2574 g. in 25 cc. $CHCl_3$); the filtrate gave a ppt., decomps. 160–80°, $[\alpha]_D^{20}$ 21.7 to 46.7°. The *l-acid* m. 225–6°, $[\alpha]_D^{20}$ —62°; the *d*-acid was obtained with widely variable rotations but always positive. The *d*-acid shows a half-life of 72 min. in $CHCl_3$ and 1080 min in EtONa; the *l*-acid, 29 in abs. EtOH and 2190 min. in 0.1 *N* NaOH.

C. J. WEST

**Rearrangement of the phenylhydrazones of some unsymmetrically substituted dibenzalacetones.** L. CHAS. RAIFORD AND JOHN B. ENTRIKIN. *J. Am. Chem. Soc.* **55**, 1125–8(1933).—*Styryl 4-nitrostyryl ketone*, brownish yellow, m. 178–9°, results in 40% yield from $4\text{-}O_2NC_6H_4CHO$ and PhCH:CHAc; phenylhydrazone, yellow, m. 100–1°; boiling with AcOH gave a product, m. 149–50°, regarded as the pyrazoline. *Styryl 4-chlorostyryl ketone phenylhydrazone*, m. 165–6°; the pyrazoline m. 184–5°. In other cases the pyrazolines were the only product formed. *1,5-Diphenyl-3-(4-chlorophenyl)-pyrazoline*, m. 149–50°; *3-chlorostyryl deriv.*, dark yellow, m. 153–4°; *4-chlorostyryl deriv.*, deep yellow, m. 184–5°; *3-nitrostyryl deriv.*, orange, m. 182–3°; *4-nitrostyryl deriv.*, m. 191–2°; this seps. with 1 mol. of EtOH. In the rearrangement of these hydrazones the closing of the pyrazoline ring involved the unsatn. farthest away from the Ph nucleus contg. the halogen or $NO_2$ radical. This was indicated by the fact that in the oxidation of the pyrazolines 1,5-diphenylpyrazole-3-carboxylic acid and BzOH or

a substituted BzOH were obtained. Oxidation of pyrazolines contg. a Br atom or a $NO_2$ radical in the hydrazine residue seems to cause complete degradation of the mol.

C. J. WEST

**Heterocyclic compounds. II.** ANUKUL C. SIRCAR AND INDU B. PAL. *J. Indian Chem. Soc.* **9**, 527–32(1932).—Diheterocyclic compds. were prepd. from α,β-diaminoquinoxaline (I) in order to compare their properties with analogous compds. obtained from 2,3-diaminophenazine (*C. A.* **20**, 1805). The new compds. are invariably lighter in color. The following *α,β-quinoxalinoimidazoles* were prepd. by heating I and the proper acid anhydride 0.5 hr. at 200–20°; *o-benzoylene*, light yellow, m. above 300°; *o-naphthoylene*, yellow; *o-camphoroylene*, dirty yellow, m. 280°; *o-diphenoylene*, brownish yellow. I (0.5 g.) and BzH (1 g.), refluxed 1 hr. in $C_5H_5N$, give *4,5-quinoxalino-2-phenylimidazole* (II), yellow, shrinking at 275° and m. 290°. The following *derivs.* of II were obtained similarly from substituted benzaldehydes: *4'-Me*, brownish yellow; *4'-nitro*, red; *3'-nitro*, yellowish white; *2'-HO*, brown; *2',4'-HO*, yellow; *4'-MeO*, light orange-yellow; *4'-dimethylamino*, brownish yellow. Furfural and I gave *4,5-quinoxalino-2-furfurylimidazole*, light yellow-brown. All the above compds. m. above 300°. In the absence of solvent, I (0.5 g.) and BzH (20 cc.) heated 1.5 hrs. give *4,5-quinoxalino-1-benzyl-2-phenylimidazole*, yellow, m. above 300°. Similarly, I and *o*-$C_6H_4(OH)CHO$ yield *4,5-quinoxalino-1-o-hydroxybenzyl-2-phenylimidazole*, yellow, m. above 300°; while from I and *p*-$MeOC_6H_4CHO$ is obtained *4,5-quinoxalino-1-p-methoxybenzyl-2-p-methoxyphenylimidazole*, light brownish yellow, m. 243–5°. A. F. S.

**Derivatives of imidazole. III. Occurrence of 4-hydroxymethylimidazole.** TEIJIRO YABUTA AND KATSUJI KAMBE. *J. Agr. Chem. Soc. Japan* **8**, 815–20(1932).—A mixt. of 25 g. fructose, 25 g. $Cu(OH)_2$ and 310 cc. 20% $NH_4OH$ was dild. with $H_2O$ to 1 l. and sealed in a bottle for 1 month. O was supplied from time to time until it was no longer absorbed. The greenish blue ppt. obtained was freed from Cu by $H_2S$, and from the aq. soln. of 4.3 g. of a picrate, fine needles or plates, m. 205–6°, was prepd. From the filtrate of the greenish blue ppt. 3 g. of the same picrate was obtained; HCl salt m. 93°. The compd. was identified as 4-hydroxymethylimidazole (I). A mixt. of 10 g. fructose, 5 cc. formalin, 5 cc. $NH_4OH$ (10%) and 0.2 cc. methylene blue was kept in a sealed bottle and supplied with O. The methylene blue was removed by charcoal when the reaction was completed. A base was isolated as the picrate and identified as I; the yield was 0.2 g. From the reaction of 10 g. fructose, 5 cc. formalin, 8 g. $NH_4$ phosphate and 200 cc. 10% $NH_4OH$ the picrate of I was again isolated. Hydroxygluconic acid soln. was prepd. from the Ca salt and treated with $Cu(OH)_2$ and $NH_4OH$ as above. The picrate of I was isolated, and from the mother liquor of the picrate, the picrate of imidazole-4-carboxylic acid, m. 195°, was isolated. Y. KIHARA

**Synthesis of imidazole derivatives from α-amino acids. I. A new synthesis of desaminohistidine and a contribution to the knowledge of the constitution of ergothioneine.** SHIRO AKABORI. *Ber.* **66B**, 151–8(1933).—By reducing the esters of glycocoll, alanine and glutamic acid in aq. acid soln. with Na-Hg to the corresponding amino aldehydes and treating the latter with $NH_4NCS$, A. obtained the 2-mercapto derivs. of imidazole, 4-methylimidazole and desaminohistidine (β-imidazolylpropionic acid) (I), and from these the imidazoles themselves. For these syntheses it is not necessary to isolate the amino aldehyde. The amt. of alc. needed to prep. di-Et glutamate by Fischer's method (*Ber.* **34**, 453(1901)) can be greatly reduced by heating the acid *in vacuo* to about 190°, treating the resulting pyrrolidonecarboxylic acid in alc with HCl gas and boiling. The HCl salt of Et glutamate is readily reduced by Na-Hg, even below —10°, but the aldehyde acid could not be isolated in pure form. A. therefore tried to convert the Et glutamate into the Et pyrrolidonecarboxylate, but the latter could not be reduced to the pyrrolidonealdehyde. Accordingly, he treated the soln. resulting from the reduction of the Et glutamate directly with $NH_4NCS$ and obtained the *2-mercapto deriv.* (II) of I in crystals with 1 $H_2O$, m. 205–6.5°, readily desulfurized to I by $FeCl_3$ or $H_2O_2$. The I was identified by conversion through its ester and hydrazide into histamine. The mercaptoimidazolylacrylic acid obtained from ergothioneine with alkali yields II with Na-Hg, showing that the SH group in ergothioneine is in position 2. **II. Synthesis of some new imidazole derivatives, and the constitution of pilocarpine.** SHIRO AKABORI AND SHINJI NUMANO. *Ibid* 159–65.—Using the method described in the preceding abstr., A. and N. have prepd., through the 2-mercapto derivs., *4-isobutyl-* (I), *4-benzyl-* (II), *4-amyl-* (III) and *3-methyl-4-amylimidazole* (IV) from leucine, phenylalanine, $AmCH(NH_2)CO_2H$ and *α-methylaminoheptylic acid* (V), resp. Jowett obtained, as a degradation product of isopilocarpine, a substance which he believed to be 3-methyl-4-amylimidazole (*J. Chem. Soc.* **83**, 447(1904)), and A. and N. have repeated his work in order to compare his product with their synthetic compd. Because of the small amts. available, sufficiently pure materials could not be used for the comparison but in view of the similarity in their properties they may well be identical,

which would confirm the structure $CH_2.O.CO.CHPh.CHCH_2C:CH.N:CH.NMe$

for pilocarpine. *2-Mercapto deriv.* of **I** (yield, 16.8%), m. 183–4°; **I**, $b_6$ 143–4.5°, m. 72–3°. *2-Mercapto deriv.* of **II**, m. 221–2°; **II**, $b_{0.12-0.15}$ 145–8°, m. 84–5°. *Et α-aminoheptylate*, $b_5$ 82–5°. *2-Mercapto deriv.* of **III**, m. 114–5.5°; **III**, $b_{16}$ 188–8.5°, m. 44–6° **V** (19 g. from 40 g. $AmCHBrCO_2H$ and 33% aq. $NH_2Me$ at 100–20° in a pressure kettle), m. 260–2° (sealed capillary); *Et ester*, $b_5$ 80–2°. *2-Mercapto deriv.* of **IV**, m. 143–4°; **IV**, $b_{13}$ 152–2.5°, $d_4^{25}$ 0.9411, $n_D^{25}$ 1.48289; *picrate*, yellow, m. 130–0.5°; *chloroplatinate*, m. 212–13° (foaming). That portion of the product obtained by soda-lime distn. of pilocarpine which $b_{12}$ 152–7° showed $d_4^{25}$ 0.9885, $n_D^{25}$ 1.52024; picrate, m. 125–8°; chloroplatinate, m. 196–7° (foaming). As already noted by Jowett, the compns. of the picrate and chloroplatinate are closer to those of derivs. of a methylamyleneimidazole, $C_9H_{14}N_2$, than of IV, $C_9H_{16}N_2$. C. A. R.

**The directive effect of substituents on the cyclization of substituted *s*-diarylthiocarbamides. I. The effect of fluoro, iodo and cyano substituents on the formation of anilinobenzothiazole derivatives from mono-*p*-substituted thiocarbanilides and bromine.** Robert F. Hunter. *J. Indian Chem. Soc.* **9**, 435–40(1932).—H. studies the effect of different substituents and hydrocarbon groupings on the thiazole cyclization of *s*-diarylthiocarbamides by Br and other reagents. It has previously been shown that the bromination of *p*-chloro- and *p*-bromo-*s*-diphenylthiocarbamides gives rise to 4′-substituted 1-anilinobenzothiazoles. H. finds also that ring formation occurs on the unsubstituted nucleus when *p*-fluoro- and *p*-iodo-*s*-diphenylthiocarbamide are treated with Br in the usual way, producing the corresponding 4′-substituted 1-anilinobenzothiazoles, whose formulas are established by the synthesis from 1-chlorobenzothiazole and the corresponding *p*-haloanilines. The following compds. were prepd.: *p-fluoro-s-diphenylthiocarbamide*, m. 175–6°; *4′-fluoro-1-anilinobenzothiazole*, m. 200–1°; *p-iodo-s-diphenylthiocarbamide*, m. 168°; *4′-iodo-1-anilinobenzothiazole*, m. 213°; *p-cyano-s-diphenylthiocarbamide*, m. 161–2°; *4′-cyano-1-anilinobenzothiazole*, m. 206°. H. W. Leahy

**A preliminary note on a new method of synthesizing benzopyrylium compounds.** M. N. Goswami and Amna Kumar Chakravarti. *J. Indian Chem. Soc.* **9**, 599–600 (1932). On heating a mixt. of coumarin and resorcinol in the presence of $POCl_3$ and extg. the unchanged material with $Et_2O$, an orange-red compd. contg. Cl was sepd. which behaves as though constituted as 2′,4′-dihydroxy-2-phenylbenzopyrylium chloride (**I**), $C_{15}H_{11}ClO_3.3H_2O$, an extremely hygroscopic compd. difficult to analyse correctly for H. Attempts at synthesis from salicylaldehyde and resacetophenone failed. The di-MeO deriv. of I was prepd. by substituting dimethoxyresorcinol in the original prepn. and also by synthesis from salicylaldehyde and dimethoxyresacetophenone. Both prepns. gave the same orange-red cryst. deriv., *2′,4′-dimethoxy-2-phenylbenzopyrylium chloride ferrichloride*, $C_{17}H_{15}ClO_3.FeCl_3$, m. 175°. Almost all other phenols and phenolic esters have been found to condense similarly with coumarin and substituted coumarins in the presence of $POCl_3$ to yield benzopyrylium compds., the prepn. of which is being further investigated. C. R. Addinall

**Glucosides of flavone. I.** T. Nakaoki. *J. Pharm. Soc. Japan* **52**, 1085–8 (1932)(in German 195–7).—A preliminary report, chiefly on the qual. test for flavone glucoside in the various species of flowers. **II. Constituents of Rhododendron rosmarinifolium, Dippel. 1.** *Ibid* 1089–93(in German 198).—From the alc. ext. of *Rhododendron rosmarinifolium*, Dippel, N. isolated a certain glucoside which on hydrolysis gave quercetin (**I**), $C_{15}H_{10}O_7$, m. 310°. Methylation of I with $CH_2N_2$ gave monomethylquercetin, m. 296°, which on acetylation gave tetraacetylrhamnetin, m. 185–6°. I and $Me_2SO_4$ gave tetramethylquercetin, m. 156–7°. From the mother liquor N. isolated glucose and rhamnose in the form of the phenylosazones, m. 210° and 180°, resp. F. I. Nakamura

**Fukugetin. I.** J. Shinoda. *J. Pharm. Soc. Japan* **52**, 1009–24(1932)(in German 167–9).—Analysis of fukugetin (**I**) gave $C_{28}H_{20}O_{10}.2.5H_2O$ instead of the formula reported by Perkins (*J. Chem. Soc.* **1904**, 58–9) and other Japanese investigators. Anhyd. fukugetin m. 272–3° and corresponds to the loss of 1 water mol. from I. Methylation of I with $CH_2N_2$ gave hexamethylfukugetin (**II**), $C_{28}H_{14}O_{10}(CH_3)_6$, m. 202–4°, trimethyl deriv., m. 255°, and ethylfukugetin, m. 150°. II and alc. KOH gave compds., $C_{26}H_{28}O_{10}$, m. 202°, $C_{26}H_{26}O_9$, m. 227–8°, and compds. m. 178–80° and 215–16°. I and 50% KOH in the atm. of H gave acetanilide, m. 112°, anhydrofukugetin (**III**) ($C_{19}H_{12}O_6$), m. <300°, fukugenetin, $C_{19}H_{14}O_7$, m. 205°, phloroglucinol and garcinol, m. 308°. Acetylation of III gave a compd. m. 266–7° which did not depress the m. p. of acetylfugenetin m. 265°. Methylation of III gave a Me deriv., $C_{19}H_{10}O_7Me_4$, m. 195–6°, which did not depress the m. p. of methylfukugenetin, m. 204°, while with EtOH it gave a compd. which did not depress the m. p. of ethylfukugenetin, m. 171–2°.

Acetylfukugenetin and KOH in H gave III. Garcinol ethyl ether m. 167°; acetate m. 201–2°. Fukugenetin or III when treated with 50% KOH for 2–4 hrs. at 150–70° gave AcOH, 3,4-dihydroxyacetophenone, m. 118–9°, garcinol and an acid m. 187°.
F. I. NAKAMURA

**Reaction of organic halides with piperidine. III. Cyclohexyl bromide and the butyl bromides.** W. V. DRAKE AND S. M. MCELVAIN. *J. Am. Chem. Soc.* **55**, 1155–8 (1933); cf. *C. A.* **26**, 988.—The isolation of 4 different *N*-butylpiperidine HCl salts from the reaction of piperidine with the BuBr has demonstrated that these bromides in this reaction do not rearrange previous to reaction. The *HCl salts* of the Bu, *sec*-Bu, iso-Bu and *tert*-Bu derivs. m. 239–40°, 208–9°, 257–8° and 268–9°; that of the *cyclohexyl deriv.* m. 292–3°. The difference between the behavior of cyclohexyl bromide and other sec. bromides has been found to be 1 of degree rather than kind. *N*-Butylpiperidine, $b_{740}$ 171–2°, $d_{25}^{25}$ 0.8210, $n_D^{25}$ 1.4442; *sec-isomer*, $b_{740}$ 169–70°, d. 0.8334, *n* 1.4468; iso-Bu isomer, $b_{740}$ 160–1°, d. 0.8161, *n* 1.4382. C. J. WEST

**Quinoline derivatives. XLI. Derivatives of 2-phenyl-4-quinolylamino-acetic acid.** HANNS JOHN AND GEORG BEHMEL. *J. prakt. Chem.* **136**, 121–4(1933); cf. *C. A.* **27**, 982.—*2-Phenyl-4-quinolylaminoacetyl chloride*, m. 272°; β-chloroethyl ester, m. 104°; *diethylamide*, m. 149°; *ethanolamide*, m. 210°. C. J. WEST

**The way in which quinoline derivatives are formed from carboxanilides, and the transformations of acetanilide imide chloride.** ALBRECHT HEYMONS AND WERNER ROHLAND. *Ber.* **66B**, 130–8(1933).—While anilides, $RCH_2CONHPh$ (R = Cl, alkyl or aryl) are converted into 2,3,4-substituted quinolines by $PCl_5$, AcNHPh (R = H) under the same conditions gives an acyclic chlorovinylamidine base, MeC(:NPh)-NPhCCl:$CH_2$ (I). On the basis of certain generalizations derived from a study of the steric influence of *o*-substituents, v. Braun and Rudolph (*C. A.* **26**, 428) concluded that also where ring closure occurs an amidine base is first formed from 2 mols. of the imide chloride. This view found support in the fact that under energetic conditions AcNHPh can in part be converted into a quinoline deriv., γ-anilinoquinaldine (II). This was confirmed recently by Backeberg (*C. A.* **26**, 3507) but he interprets the reaction entirely differently; according to him all anilides with $PCl_5$ first form a labile condensation product of 2 mols. amide chloride which then yields the amidine base or the quinoline by loss of 2 or 3 mols., resp., of HCl. That the amidine bases are formed from amide, not imide, chlorides (Stephen and Bleloch, *C. A.* **25**, 3329) is disproved by the observation that a soln. of the pure imide chloride MeCCl:NPh yields I on heating. It then remained to be detd. whether quinoline formation is preceded by condensation of amide chloride mols. or is the result of further changes in the amidine base. $ClCH_2CONHPh$, which gives a quinoline with special ease, can, by rapid work in great diln., be converted into the imide chloride, which undergoes no further change and does not yield a quinoline on heating. As, however, it soon does form the quinoline salt when it is satd. (in the cold) with HCl gas, this salt can have been produced only from the amide chloride, $MeCCl_2NHPh$, formed by addn. of HCl to the imide chloride. Backeberg's view that II is formed in the same way from AcNHPh is not correct, however; ring formation here begins only after I has been formed and has undergone further changes, and, moreover, the yield is exactly the same whether the components are heated quickly or only after they have stood for weeks at room temp. In attempts to effect ring closure in I directly by heating it with a $POCl_3$ soln. satd. with HCl gas, unexpected difficulties were encountered; along with much resinous material there was formed a mixt. of compds in which no II could be detected and which contained AcNHPh, MeC(:NPh)NHPh and a small amt. (10%) of a base $C_{24}H_{23}ON_3$ (III), which is also formed regularly as a by-product, with II, in the reaction between AcNHPh and $PCl_5$. As there did not seem to be much hope of obtaining light on the reaction in this way, a study was made of the thermal decompn. of the free I. When I is heated in dil. soln. in a neutral solvent, 2 mols. give 1 mol. MeCCl:NPh and a *compd.* $C_{24}H_{22}N_3Cl$ (IV) which has the properties of an imide chloride and is hydrolyzed to a weakly basic *compd.* $C_{24}H_{23}ON_3$ (V). V is decompd. by hot concd. HCl into MeC(:NPh)NHPh, $PhNH_2$ and AcOH. In attempts to prep. the imido ester from IV with alc. there occurred, even at room temp., complete decompn. into MeC(:NPh)NHPh, $AcNH_2$ and AcOEt; this decompn. could have been effected only by the HCl set free in the reaction. V in neutral soln. with dry HCl gas was likewise readily decompd. into MeC(:NPh)NHPh.HCl and a very hygroscopic product which was converted by traces of moisture into $PhNAc_2$. These reactions are represented as follows: I + $CH_2$:C(NHPh)NPhCCl:$CH_2$ (VI) ⟶ MeC(:NPh)-NPhC(:$CH_2$)NPhC(:$CH_2$)NPhCCl:$CH_2$ (VII) ⟶ MeC(:NPh)NPhC(:$CH_2$)NPh-CCl:$CH_2$ (IV) [+ $CH_2$:CClNHPh] $\xrightarrow{H_2O}$ MeC(:NPh)NPhC(:$CH_2$)NPhAc (V) $\xrightarrow{HCl}$ [MeC(:NPh)NHPh.HCl +] $CH_2$:CClNPhAc $\xrightarrow{H_2O}$ AcNPhAc. As with the

*N*-aliphatic-substituted chloroalkenyl bases (*C. A.* **26**, 2739), a H atom in 1 mol. of I migrates to the N (VI), union occurs between a C and a N atom (inter-, not intramolecularly, in this case) and the resulting VII is decompd. into IV by the HCl set free. V, the hydrolysis product of IV, is isomeric with III, and with $POCl_3$ it gives an imide chloride which on hydrolysis yields III. III can be hydrogenated to a *compd.* $C_{24}H_{23}ON_3$ (VIII) and, unlike V, is not decompd. by HCl gas. Its HCl salt has a strikingly intense yellow color, very similar to that of quinoline derivs., but with concd. HCl it gives only $PhNH_2$ and AcOH, together with a little AcNHPh. On distn. it loses water with formation of the calcd. amt. of II. When heated with $POCl_3$ it merely forms an *addn. product*, m. 256° (*HCl salt*, very hygroscopic, m. 184°), unchanged by longer heating, which regenerates III with cold water and on energetic hydrolysis yields 1 mol. $PhNH_2$, approx. 1 mol. AcNHPh and some $AcCH_2CONHPh$. III is therefore thought to be a *β-anilinocrotonylacetdiphenylamidine*, $MeC(:NPh)NPhCOCH:CMeNHPh$, whose imide chloride, $MeC(:NPh)NPhCCl:CHC(:CH_2)NHPh$, results from a rearrangement of IV with rupture of the C-N union and formation of a new C-C union. Therefore, although H. and R. have not been able to obtain II from I, they believe this is because the soly. properties of I are such that it is not possible to obtain exactly the same conditions as when AcNHPh is treated with $PCl_5$, and that the formation of II can be assumed as proceeding through the intermediate products I and IV. The exceptional position occupied by AcNHPh, as compared with other anilides, is, in the last analysis, due only to the fact that the change from the amide to the imide chloride is so rapid that condensation to a quinoline cannot take place and ring closure can be effected only by more energetic means through I. III, faintly yellow, m. 117°; *picrate*, m. 158°; *chloroplatinate*, orange, m. 201–3° (decompn.). VIII, m. 146°. IV, very hygroscopic, m. about 190° (decompn.). V, m. 139°, forms no picrate; its HCl salt is stable only in HCl. C. A. R.

**The production of kynurenic acid from tryptophan derivatives.** Clarence P. Berg. *Proc. Iowa Acad. Sci.* **38**, 169(1931); cf. *C. A.* **25**, 4921.—Tryptophan, when administered to certain animals, is converted into kynurenic acid. Use has been made of this fact in the study of possible cleavage of tryptophan derivs. in the alimentary tract and in the body proper. The methylene, Bz, Ac and Et ester-HCl derivs. of tryptophan were prepd. and administered *per os* and subcutaneously. Of these, only the Et ester-HCl gave rise to an output of kynurenic acid comparable to that yielded by an equiv. amt. of free tryptophan. The methylene and Bz derivs. did not yield appreciable quantities of kynurenic acid. Administration of the Ac deriv. caused a definite, though small, output of kynurenic acid. Apparently, tryptophan Et ester-HCl is readily hydrolyzed in the body, acetyltryptophan is split to a limited extent and benzoyltryptophan and methylenetryptophan do not undergo cleavage.

W. G. Gaessler

**Reaction of 2,4-dichloroquinazoline with sodium azide.** R. Stollé and Fr. Hanusch. *J. prakt. Chem.* **136**, 120(1933); cf. *C. A.* **27**, 1632.—2-Chloro-4-ethoxyquinazoline and $NaN_3$ give *1,2-tetrazolo-4-ethoxyquinazoline 1,2-dihydride*, m. 165°; 2 *N* NaOH splits off the EtO group, giving the same compd. as previously obtained from 2,4-dichloroquinazoline; this compd. thus has the $N_3$ group in the 4-position.

C. J. West

**Pyrimidines. CXXXI. Reduction of 1,2,3,4-tetrahydropyrimidines.** Karl Folkers and Treat B. Johnson. *J. Am. Chem. Soc.* **55**, 1140–7(1933); cf. *C. A.* **26**, 5302.—The catalytic reduction of 2-keto-4-R-5-carbethoxy-6-methyl-1,2,3,4-tetrahydropyrimidines has been studied; the 5,6-double bond in such pyrimidine combinations is very resistant to change. In all cases examd. the 4-aryl groups were attacked by H in the presence of the catalyst and reduced to the corresponding hexahydro or satd. structure. Thus when R is Ph or cyclohexyl the reduction product is the *cyclohexyl deriv.*, m. 237.5–8.5°; phenylethyl or 2-dihydrophenylethyl gives the *2-cyclohexylethyl deriv.*, m. 192.5–3.5°; styryl gives the 2-cyclohexylethyl deriv. or the 2-dihydrophenylethyl deriv., m. 170.5–1.5°. *2-Keto-4-methyl-5-carbethoxy-6-phenyl-1,2,3,4-tetrahydro pyrimidine*, m. 165–6.6°, results from AcH, $BzCH_2CO_2Et$ and $CO(NH_2)_2$ in AcOH; catalytic reduction gives *2-keto-4-methyl-5-carbethoxy-6-cyclohexylhexahydropyrimidine*, m. 179–81°; the *free acid* m. 290–1°. C. J. West

**Quinazolines. V. The partial hydrolysis of 2,4-dialkoxyquinazolines with the formation of 2-alkoxy-4-ketodihydroquinazolines.** N. A. Lange and F. E. Sheibley. *J. Am. Chem. Soc.* **55**, 1188–94(1933); cf. *C. A.* **27**, 93.—2,4-Diethoxyquinazoline (4 g.) in 20 cc. EtOH, added to 0.5 g. Na in 20 cc. EtOH and the mixt. boiled 6 hrs. on the steam bath, gives 3.3 g. 2-ethoxy-4-ketodihydroquinazoline, m. 179°. The 2-MeO deriv. was similarly prepd.; with $Me_2SO_4$ and *N* NaOH there results *2-methoxy-3-methyl-4-ketodihydroquinazoline*, m. 93°, giving with warm dil. HCl 3-methylbenzoylene-

urea, m. 242°. Hydrolysis of 2-chloro-4-ethoxyquinazoline and 2-phenoxy-4-alkoxyquinazolines likewise gives 2-chloro-4-ketodihydroquinazoline and *2-phenoxy-4-ketodihydroquinazoline*, m. 272°. All m. ps. are cor. C. J. WEST

**Alkaloid of the Chinese drug, "Chin-Shih-Hu." II. Dendrobine. I.** HIDEKI SUZUKI AND ICHIRO KEIMATSU. *J. Pharm. Soc. Japan* **52**, 1049–60(1932)(in German 183–7).—The present paper deals with the properties of dendrobine (I), $C_{16}H_{23(25)}NO_2$, m. 134°, $[\alpha]_D^{18}$ —51.5° (in abs. alc.), colorless needles. I forms the following salts: *Au salt*, $C_{16}H_{23(25)}NO_2.HAuCl_4$, m. 181°; *HCl salt*, decomps. 246°, $[\alpha]_D^{14}$ —41° (in water), *HI salt*, decomps. 278°, $[\alpha]_D^{14}$ —34.47° (in water); *MeI salt* decomps. 231°, $[\alpha]_D^{15}$ —30.9°. I is inactive toward $NH_2OH$, semicarbazide, $PhNHNH_2$, anhyd. AcOH, BzCl, AcCl and $CH_2N_2$. I does not contain the MeO group, but the tertiary N group, >NMe or —$NMe_2$ and 1 lactone linkage. S. and S. propose the formula $C_{14}H_{22(20)}$ $\begin{cases}=NMe\\—CO.O—\end{cases}$ or $C_{13}H_{19(17)}$ $\begin{cases}—NMe_2\\—CO.O—\end{cases}$ for I. F. I. NAKAMURA

**Alkaloids of Holarrhena antidysenterica. I. Three new alkaloids from the bark of Indian Holarrhena and new methods of isolation and further purification of conessine.** SALIMUZZAMAN SIDDIQUI AND P. PARAMESWARAN PILLAY. *J. Indian Chem. Soc.* **9**, 553–63(1932).—About 17 kg. of dried powd. bark, 1 yr. old, purchased in Lahore, was percolated with a mixt. of 80 parts of $Et_2O$ with 10 parts of alc. shaken with 10 parts of $NH_4OH$. The percolate was acidified with dry HCl, yielding crude alkaloidal salts to which was added the residue from the distd. extn medium. These crudes, dissolved in 2 l. of $H_2O$, were pptd with $Na_2SO_4$. After filtration from the insol. sulfates (I) (38 g.) the filtrate was treated with 20% NaOH and the free alkaloids (II) (326 g.) were extd. with $Et_2O$. The passage of $CO_2$ through the petroleum ether ext. from II yielded an insol. carbonate (III). Direct crystn. from $Me_2CO$ of the petroleum ether-sol. non-carbonate material from II gave a crude alkaloid which on further purification by passage of $CO_2$ through its petroleum ether soln. and removal of the last traces of secondary bases by treatment with $NaNO_2$ in AcOH yielded 68 g of conessine (IV), $C_{24}H_{40}N_2$, m. 126° (cor.), in large prismatic plates, or in long needles from dil. undisturbed solns.; HCl salt, m. 338–40° (decompn.); HI salt, m. 308° (decompn.); picrate, m. 222–4° (decompn.); oxalate, m. 372° (decompn.). By fractional pptn. of the HCl salt of III by $NH_4OH$ and NaOH the material was freed from traces of I and IV. Addn. of KI to its soln. in HCl gave 50 g. of a cryst. HI salt which after recrystn. from a mixt. of EtOH and MeOH was converted into the base, dissolved in petroleum ether and satd. with $CO_2$. Recrystn. of the base from the pptd. carbonates from dry solvents gave 0.12% of *conessimine* (V), $C_{23}H_{38}N_2$, m. 100°, $b_{1.8}$ 230°, $[\alpha]_D^{35}$ —22.25°; *dihydrate*, $C_{23}H_{38}N_2.2H_2O$, m. 91° (from moist EtOAc); *carbonate*, m. 105° (softens at 70°), *HCl salt*, m. 342–4°, $[\alpha]_D^{26}$ —15.10°; *chloroplatinate*, m. 301° (decompn.); *chloroaurate*, m. 165° (decompn.); *HI salt*, m. 318–9° (decompn.), *picrate*, m. 172–4°; *nitroso conessimine*, $C_{23}H_{37}N_3O$, m. 240–1° V contains 1 active H atom and 2 NMe groups. The nearly white granular residue from the treatment of I with 10% HCl was dissolved in hot 10% MeOH-HCl, neutralized with $NH_4OH$ and mixed with an equal quantity of hot 1% $H_2SO_4$. The base from the sulfate (10 g.) thus formed was recrystd. from a mixt of MeOH and EtOAc, yielding 0.6 g. of *holarrhine* (VI), $C_{20}H_{38}N_2O_3$, m. 240°, $[\alpha]_D^{25}$ —17.01°; *chloroplatinate*, darkens at 270°, chars above 300°; *picrate*, darkens at 275°, m. above 320°. VI appears to be a secondary base. The residue from the mother liquors of VI, on recrystn. from hot EtOAc produced 0.03% of *holarrhimine* (VII), $C_{21}H_{36}N_2O$, m. 183°, $[\alpha]_D^{25}$ —14.19°; *carbonate*, decompg. above 80°; *HCl salt*, m. 345°, $[\alpha]_D^{25}$ —22.80°; *chloroplatinate*, chars above 300°, *HBr salt*, m. 358–60° (decompn.); *picrate*, m. 198–200° (decompn.); *hydrate*, m. 108–10°, *sulfate*, m. 337°, almost insol. in $H_2O$ and org. solvents. VII is a diacid base, has no -OMe groups but contains 3 active H atoms. Color reactions of IV, V, VI and VII with concd. $H_2SO_4$, $HNO_3$, a mixt. of concd. $H_2SO_4$ and $K_2Cr_2O_7$, Erdmann's and Frohde's reagents are tabulated. C. R. ADDINALL

**The alkaloids of Rauwolfia serpentina, Benth. I.** SALIMUZZAMAN SIDDIQUI AND RAFAT H. SIDDIQUI. *J. Indian Chem. Soc.* **9**, 539–44(1932); cf. *C. A.* **26**, 1288 *Ajmaline* (I) probably corresponds to the *rauwolfine* of Van Itallie and Steenhauer (*Arch. Pharm.* **270**, 313(1932)). A discordance arose because the prepn. of S. and S. contained 3.5 mols. $H_2O$ of crystn., 0.5 mol. of which is retained at 100° and only lost at 150°. The empirical formula of I is $C_{21}H_{26}O_2N_2$. The Zerevitinov procedure shows 1 active H in I after drying at 150°; and the Herzig and Meyer procedure indicates 1 NMe group. I appears to be a secondary base and forms a *nitroso deriv.*, pale yellow, non-basic, m. 209°; a *Bz deriv.*, m. 214–6° (decompn.), and a *Me deriv.* whose *HI salt* m. 230–1; *HCl salt*, froths at 132–4° and m. 272°; *picrate*, froths at 176° and m. 186°, and *chloroplatinate* shrinks at 203° and m. 215–20°. Heating I 0.5 hr. at 200° yields

*pyroajmaline* ($C_{21}H_{26}O_2N_2$?), m. 256°; its *HCl salt* softens at 230° and m. 238–40° (decompn.). *Ajmalinine* and *serpentine* each contain 1 MeO group. A. F. SHEPARD

**Actinodaphnine. An alkaloid from Actinodaphne hookeri, Meissn.** S. KRISHNA AND T. P. GHOSE. *J. Indian Chem. Soc.* **9**, 429–33(1932).—From the bark of *Actinodaphne hookeri* a new alkaloid has been isolated which is different from the alkaloids laurotetanine, bebeerine and buxine found in certain plants of the N. O. *Laurineae*. The new alkaloid is called *actinodaphnine*, $C_{18}H_{19}O_4N$, mol. wt. 313. It contains a MeO, a NMe and a HO group. H. W. LEAHY

**A new synthesis of 3,10-dimethoxytetrahydroprotoberberine.** SATYENDRA NATH CHAKRAVARTI, N. ANANTHA VAIDYANATHAN AND A. VENKATASUBBAN. *J. Indian Chem. Soc.* **9**, 573–6(1932); cf. *C. A.* **23**, 2183.—Heating together *m*-$MeOC_6H_4CH_2CH_2NH_2$ and *p*-$MeOC_6H_4CH_2CO_2H$ at 180° for 2 hrs. and crystg. the product from benzene with the aid of animal charcoal gave *p*-methoxyphenylaceto-*m*-methoxyphenylethylamide (I), $C_{18}H_{21}NO_3$, m. 81°. On heating 10 g. of I with 25 cc. of $POCl_3$ for 2 hrs. on the steam bath, decompg. with cold $H_2O$ and treating with NaOH in the presence of benzene, *6-methoxy-1-(4'-methoxybenzyl)-3,4-dihydroisoquinoline* (II), $C_{24}H_{22}N_4O_3$, was formed as a colorless oil in 80% yields; *picrate*, m. 146°. Reduction with Zn and $H_2SO_4$ converted II into *6-methoxy-1-(4'-methoxybenzyl)-1,2,3,4-tetrahydroisoquinoline* (III), $C_{18}H_{21}NO_2$; *HCl salt*, m. 196°, *picrate*, m. 197° (decompn.). III was heated with an equiv. amt. of anhyd. $HCO_2H$ at 200–10° for 3 hrs. until effervescence had ceased. The product was dissolved in toluene and boiled for 1.5 hr. with $POCl_3$. After washing with petroleum ether the residual gum was extd. with dil. HCl in the presence of bone black and the acid soln. of dihydroprotoberberine (IV) was reduced by heating with an excess of Zn dust for 2 hrs. The filtered liquid was decompd. with $NH_4OH$ and the base was extd. with $CHCl_3$. The dried soln. was concd. and the crude base yielded on recrystn. from MeOH prisms of *3,10-dimethoxytetrahydroprotoberberine*, $C_{19}H_{21}NO_2$, m. 139°. Although the cyclization of I into II takes place readily, the ring closure of III into IV is more difficult. This is probably due to the presence of a *p*-activating OMe group in I and the absence of such a group in III. C. R. ADDINALL

**Identity of narceine with pseudonarceine, its dehydration and structure.** C. R. ADDINALL AND RANDOLPH T. MAJOR. *J. Am. Chem. Soc.* **55**, 1202–9(1933).—The identity of opium narceine with that obtained by the conversion of narcotine methiodide, methochloride and methosulfate has been confirmed by comparison of the phys. properties of carefully purified material. The formulation of narceine as $C_{23}H_{27}NO_8 \cdot 3H_2O$ has been definitely established by quant. detn. of the $H_2O$ of crystn. content and analyses of the dehydrated material. Catalytic reduction of narceonic acid (I) in MeOH-dioxane gives the *dihydro deriv.*, m. 197–8° (*Me ester* (II), m. 155°). The Ag salt of I and MeI and EtI give the *Me* and *Et esters* of I, m. 155° and 139–40°, resp. II and Br in $CHCl_3$ give *Me dihydronarceonate monobromide*, m. 189°. Narceine and $MeONH_2$ in MeOH, heated 70–80 hrs at 118°, give the *methoxime*, m. 190°. Although attempts to alkylate the methylene group and to effect the reduction of the CO group by catalytic hydrogenation were unsuccessful, the lack of active H in II, its behavior on bromination and the formation of the methoxime confirm the formulation of narceine as a highly substituted desoxybenzoin. C. J. WEST

**Spectrographic study of phlorhizin and its derivatives. The ultra-violet absorption spectrum of phlorhizin.** ALBERT LAMBRECHTS. *Compt. rend.* **196**, 295–7(1933).—The ultra-violet absorption spectrum is strongly influenced by the $p_H$. A concd. soln. and a very dil. soln. at const. $p_H$ show the same absorption. The absorption at various H-ion concns. is characteristic of *keto-enol tautomerism*. The keto form predominates in acid soln., the enol in alk. At neutrality and in the blood stream the 2 forms exist in approx. equal quantities. The keto form probably predominates in alc. soln. PHILIP D. ADAMS

**Bufotalin and bufotoxin in "Senso" and its raw material. I.** HEISABURO KONDO AND S. IKAWA. *J. Pharm. Soc. Japan* **53**, 23(1933)(in German 2–7).—From the MeOH ext. of "Senso" (300 g.) K. and I. have isolated bufotalin (I), $C_{26}H_{36}O_6$, m. 107° and decomps. 134–6° (cf. Wieland, *C. A.* **17**, 73). Acetylation of I with anhyd. AcOH gave a compd., $C_{28}H_{38}O_7$, m. about 120°. Action of alc. KOH on I gave desacetylbufotalin (II), $C_{24}H_{34}O_5$, decomps. about 130°. II in glacial AcOH in the cold and dry HCl gave desacetylbufotalin chloride, $C_{24}H_{33}O_4Cl$, decomps. 140–5°; which on acetylation gave the Ac deriv., $C_{26}H_{35}O_5Cl$, decomps. 160–5°. I and dry HCl gave bufotalin chloride, decomps. 125–8°, while I and HBr gave the bromide, m. 100–14°. I and concd. HCl gave anhydrobufotalin chloride, m. 120–30°. Oxidation of I with $CrO_3$ gave bufotalone, $C_{26}H_{34}O_6$, m. about 135°. The oximes of I and desacetylbufotalin m. 225–6° and 150–5°, resp. Bufotoxin (cf. *loc. cit.*), $C_{40}H_{62}O_{11}N_4$, m. 145–6°. F. I. NAKAMURA

**Humic substances. III. Oxidation of humic substances obtained from phenols.** N. A. ORLOV AND N. D. LIKHACHEV. *J. Applied Chem.* (U. S. S. R.) **5**, 797–802(1932);

cf. *C. A.* **26**, 3485, 5078.—Oxidation of humic substances obtained from phenols by certain reactions also involving oxidation, yields $CO_2$, AcOH, oxalic, mellitic and various aromatic acids which are also obtained in the oxidation of natural humic substances or humic substances obtained from carbohydrates (sugar charcoal). Hydrogenation yielded among other compds. pyrene, the base of natural humic coals.
V. KALICHEVSKY

**A light-sensitive carotene pigment from saffron.** RICHARD KUHN AND ALFRED WINTERSTEIN. *Ber.* **66B**, 209–14(1933).—By the action of dil. NaOH on a freshly prepd. MeOH ext. of saffron, the authors have obtained, in addn. to the known crocetin di-Me ester (I), m. 222°, an *isomer* (II), m. 141°, differing from I in the color of the crystals, the position of the absorption bands in its spectrum, the form of the crystals and their soly. II forms rectangular elongated tablets with a color similar to that of azafrin (between hexaene and heptaene on the polyene color scale; under the microscope the crystals are pure yellow), sol. in 5900 parts MeOH at 20°, max. of the absorption bands 445, 424.5 mμ in benzine (b. 70–80°), 458, 432.5 mμ in $CHCl_3$. II is also considerably more sol. than I in ether, which permitted of its isolation. Its most striking property is the ease with which it changes into I: (1) when heated a long time at its m. p.; (2) when heated a short time in concd. benzine soln. with a trace of I; (3) when reduced with Zn dust in pyridine and a little AcOH to the S-yellow dihydro compd., which does not depress the m. p. (95°) of the dihydro deriv. of I and whose pyridine soln. on addn. of a little NaOH gives the characteristic deep green-blue color changed by shaking with air to orange with formation of I; (4) when exposed to light. The photochem. rearrangement occurs in various solvents (benzine, $CHCl_3$, pyridine, $CS_2$). Blue and violet light are the most effective, while red light has no action, as shown by comparative expts. with and without CuO-$NH_3$ filters. Neither is the ultra-violet part of the light the effective component, for the rearrangement occurs when the light is filtered through a diphenylhexatriene filter which allows no light beyond 415 mμ to pass through. With a 9-v., 3-amp. Kino lamp (Nitra Osram) at a distance of 35 cm. and an 8-mm. CuO-$NH_3$ filter (0.25% Cu) and an 8-mm. filter of a satd. soln. of diphenylhexatriene in xylene, the half-time value is 6 ± 2 min. and is hardly dependent on the nature of the solvent. With I, no change in the position of the absorption bands was noted; the photochem. equil. seems to lie entirely on the side of I. In the light-elec. photometry, for which much weaker intensities were used, there was apparently no appreciable rearrangement; below are the values of $\lambda_{max}$ (in mμ) and of the mol. extinction coeffs. ($\kappa_{max}/10^3$) for the 4 bands of longest wave length: II, 442, 216; 416, 236; 393, 144; (372), (76). I, 445.5, 258; 420, 240; 400, 158; (376), (82). The absorption curves, together with all other previous observations, indicate that II and I bear the same relation to each other as bixin and β-bixin, *i. e.*, that they are *cis-trans* isomers. From 1 kg. saffron were obtained 17.5 g. I and 0.3 g. II, but as the extraordinary lability of II was discovered only in the last stages of the purification it may well be that the saffron stigmas, if worked up when entirely fresh and protected from light, heat and catalysts, would yield considerably more II. In agreement with Karrer, it is suggested that the prefixes α- and β- in the bixin and crocetin series be discarded and that the stable, high-melting, *trans*-forms be called bixin I, crocetin I, etc., and the labile, low-melting, *cis*-forms be designated bixin II, etc. (cf. Wasserman, in Freudenberg's *Handbuch der Stereochemie*, 5. Lfg., S. 721, Vienna, 1932). C. A. R.

**The identification of carbon dioxide from the autoxidation of carotenoids.** H. H ESCHER. *Helv. Chim. Acta* **15**, 1421–4(1932).—Autoxidation of carotene results in the formation of $CO_2$ and a substance which reduces cold $NH_3$-$AgNO_3$. $CO_2$ is assumed to be a secondary product formed by oxidation of glyoxal, a decompn. product of the carotenoid. L. F. AUDRIETH

**Elemic acids from Manila elemi resin. VI. A new oxidation product of α-elemolic acid.** MILOŠ MLADENOVIĆ. *Monatsh.* **61**, 365–8(1932); cf. *C. A.* **26**, 4485.—Oxidation of α-elemolic acid with $CrO_3$ in AcOH gives a small quantity of *β-elemonic acid*, $C_{30}H_{46}O_3$, m. 220°, $[\alpha]_D^{20}$ 32.43° ($CHCl_3$). It apparently contains a CO group and yields an oxime. This may be identical with Ruzicka's δ-elemic acid (*C. A.* **26**, 4596). C. J. WEST

**Agar-agar. III.** EIJI TAKAHASHI AND KIYOSHI SHIRAHAMA. *J. Agr. Chem. Soc. Japan* **8**, 1259–66(1932); *Bull. Agr. Chem. Soc. Japan* **8**, 102–3(1932); cf. *C. A.* **26**, 5390.—Hydrato-kanten λ was freed of mineral components by electrodialysis and free λ-acid was obtained and named kanten-acid. Hydrato-kanten λ consists of the Ca salt of λ-acid. The electrodialyzed soln. was treated with a mixt. of alc., ether and benzene, and λ-acid was pptd. as a white powder. Or the λ-acid was isolated from the dialyzed soln. as the $NH_3$ salt by means of $NH_4Cl$ and 99% alc. λ-acid forms a colloidal aq. soln. and shows $[\alpha]_D$ is —31°. It contains 39.47% galactose, 8.17% pentose and 8% $SO_4$. Beside these, it contains a substance giving the ketose reaction and a hexose. Uronic acid and methylpentose could not be found. λ-Acid is unstable while the

metal and alkali salts are stable. The addn. of salts changes the viscosity of λ-acid soln. and the soln. is turned dark brown by $CaCl_2$ and yellowish brown by $NH_4Cl$.
Y. KIHARA

**The constitution of the bile acids. XLIX. Stereochemistry of bile acids and sterols.** HEINRICH WIELAND, ELISABETH DANE AND CARL MARTIUS. *Z. physiol. Chem.* **215**, 15–24(1933); cf. *C. A.* **27**, 988.—The double bond in 6-cholenic acid resulting from pyrolysis of 3-hydroxy-6-ketocholanic acid is shown to be in the 5,6-position by the fact that hydrogenation yields both cholanic and allocholanic acids. The 2 form a 1:1 mol. compd., m. 163°, which was identified by m.-p. diagram of the components. The m. p. of *allocholanic acid* was raised to 170° by distn. in a high vacuum and purification through the *Pr ester*, m. 103–4°. The unequal reactivity of cholanic acids having substituents in different rings was utilized in the prepn. of *β-3-hydroxy-6-ketoallocholanic acid* (I), m. 235° (decompn.), by partial hydrogenation of 3,6-diketoallocholanic acid (II). Pyrolysis of I gave *6-ketoallocholenic acid*, m. 122–4°, which was hydrogenated to *6-hydroxyallocholanic acid*, m. 220–4° (*Me ester*, m. 95°). Treatment of the semicarbazone of I with NaOEt and $N_2H_4 \cdot H_2O$ at 180–5° removed the O at $C_6$, yielding *β-3-hydroxyallocholanic acid* (III), m. 218° (*Me ester*, m. 151°). III is not identical with the acid previously prepd. by a similar treatment of the isomeric 3-hydroxy-6-ketoallocholanic acid. The two are epimers and bear the same relation to each other as β- and ε-cholestanol. Both yield *isoallolithobilianic acid*, m. 253–5°, when oxidized by $HNO_3$, as does also the dicarboxylic acid from cholestanol when oxidized by $CrO_3$. Hence the spatial arrangement at $C_6$ dets. whether ring A, with HO or O substitution at $C_3$, breaks open between $C_2$ and $C_3$ as in the allo-configuration, or between $C_3$ and $C_4$ as in the normal configuration.

Edited by FRIEDRICH RICHTER. **Für Band IX.** 476 pp. M. 100. **Für Band X.** 571 pp. Berlin: J. Springer.

**Hydrocarbons.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,494, Sept. 22, 1930. The conversion of $CH_4$ into hydrocarbons of higher mol. wt. is effected in app. constructed at least in part of Cr, Mo, W or alloys of these metals with each other, or of graphite. Among examples a gas contg. 86.4% $CH_4$ is passed through a graphite tube enclosed in a quartz or chamotte tube externally heated by an elec. furnace to 1000–1200°; the exit gas contains 64.5% $CH_4$ and 26.8% H, and the condensate boils below 110°. Cf. *C. A.* **27**, 1637.

**Hydrocarbons.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,549, Sept. 29, 1930. The conversion of hydrocarbons into other hydrocarbons of lower H content is effected by passing them through a heated chamber contg. filling material in which are straight channels of uniform cross section so as to avoid irregular velocities tending to the deposition of C. The process is applicable to the cracking of hydrocarbons in the liquid

but particularly in the vapor phase, especially for the production of aromatic hydrocarbons and also the conversion of $CH_4$ into olefins, $C_6H_6$, etc.

**Sulfurized higher paraffin hydrocarbons.** I. G. FARBENINDUSTRIE A.-G. Brit. 360,993, Aug. 19, 1930. Sulfurized hydrocarbons and derivs. having a mercaptan- or sulfide-like character are made by treatment with a sulfurizing agent, *e. g.*, S or Na tetrasulfide, of (1) unsatd. aliphatic hydrocarbons contg. at least 8 C atoms, *e. g.*, cetene, or (2) the unsatd., halogen-free products obtained by the action of $NH_3$ or alkalies on halogenated higher paraffin hydrocarbons according to Brit. 339,962 and 343,948.

**Sulfurized higher paraffin hydrocarbon conversion products.** I. G. FARBENINDUSTRIE A.-G. Brit. 361,356, Aug. 19, 1930. Divided out of and addn. to 360,993 (preceding abstr.). The process of Brit. 360,993 is applied to (1) halogenated paraffin hydrocarbons contg. at least 8 C atoms, or (2) conversion products of polyhalogenated derivs. of higher paraffins obtained according to Brit. 339,962 and 343,948, so far as they are unsatd. and still contain replaceable halogen.

**Conversion products of higher paraffin hydrocarbons containing sulfur.** I. G. FARBENINDUSTRIE A.-G. Brit. 361,357, Aug. 19, 1930. Divided out of, and addn. to 360,993 (2nd preceding abstr.) as modified by 361,356 (preceding abstr.). Disulfides and sulfonic acids are obtained by oxidizing the sulfidic products of 360,993 and 361,356. The water-insol. disulfides first obtained yield sulfonic acids on further oxidation. The products are useful in the textile and pharmaceutical industries.

**Oxidation of polycyclic hydroaromatic hydrocarbons.** GEORG SCHROETER. Ger. 568,338, Nov. 13, 1927. 5,6,7,8-Tetrahydronaphthalene is treated in the liquid phase with air or other gas contg. O at 50–100° in the presence of a fatty acid salt of a metal having more than one valency, *e. g.*, an oleate of Co, Pb or Mn. The reaction is stopped when 0.2–0.33 of the equimol. amt. of O has been taken up, and the mixt. is then distd. Unchanged hydrocarbon and dihydronaphthalene are separately distd. off, and a residue of 5-ketotetrahydronaphthalene remains. Octahydroanthracene, octahydrophenanthrene and other "benzopolymethylenes" may be similarly treated to produce unsatd. polycyclic hydrocarbons and cyclic ketones. Thus, octahydrophenanthrene and -anthracene yield, resp., *3, 4, 5, 6, 7, 8, hexahydrophenanthrene*, $b_{13}$ 174°, and ketoöctahydrophenanthrene; and *3, 4, 5, 6, 7, 8, hexahydroanthracene* and 1-ketoöctahydroanthracene.

**Olefin derivatives.** N. V. DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Fr. 739,266, June 29, 1932. Mixed ethers are prepd. by causing an olefin capable of giving a tertiary deriv. to react with an alc. in the presence of a catalyst at a temp. below 150°, preferably below 100°. Thus, isopropyl *tert*-butyl ether is prepd. from iso-PrOH and isobutylene in the presence of $H_2SO_4$. Other examples are given.

**Brominated hydrocarbon derivatives.** IVAN F. HARLOW and OTTO C. ROSS (to Dow Chemical Co.). U. S. 1,891,415, Dec. 20. In forming a brominated hydrocarbon such as $CHBr_3$, molten $AlCl_3$ is added to the corresponding chlorinated hydrocarbon such as $CHCl_3$ while maintaining the temp. of the reaction mixt. below the b. p. of the chlorinated compd. An arrangement of app. is described.

**Dehydration of organic compounds.** I. G. FARBENINDUSTRIE A.-G. Brit. 367,892, Nov. 27, 1930. For the catalytic dehydration of org. compds. the catalyst is rigidly applied to inner surfaces of the app. through which the heat necessary for the reaction is conducted from an exterior source, *e. g.*, it may be coated on to the inner or outer surfaces of ribbed tubes the opposite surfaces of which are heated electrically. The patent is applicable to the conversion of hydroxy compds. into unsatd. hydrocarbons, glycols into oxides, alc.-acid mixts. into esters and acids into anhydrides. Specified catalysts are (1) $NaH_2PO_4$ alone or mixed with red P or $Al(OH)_3$ and (2) $NaPO_3$ and bauxite.

**Organic compounds containing active iodine.** F. RASCHIG G. M. B. H. (Walter Prahl, inventor). Ger. 568,240, Oct. 3, 1930. Sulfo derivs. of AcH, acetone or acetophenone, having the sulfo group (s) linked to a CH group adjacent to the CO group, are treated with I or reagents yielding I under such conditions that the HI formed is continuously neutralized or eliminated. The reaction may be effected in aq. soln. at atm. temp. Iodo compds. which readily evolve I, particularly in acid soln., are obtained. Examples are given of the prepn. of $(SO_3K)_2ICCHO$; $(SO_3K)IHCCOCH_3$; $(SO_3K)$-$IHCCOCHI(SO_3K)$; $PhCOCHISO_3K$; and a Na iodoacetonetrisulfonate.

**Modified Friedel-Crafts reaction.** ADOLF KAUFMANN. Brit. 367,292, July 23, 1930. See Ger. 555,403 (*C. A.* **26**, 5101).

**Alcohols.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,553, Oct. 2, 1930. Alcs. of high mol. wt. are obtained from waxes, hydrogenation products of esters of animal or vegetable oils, or from the destructive oxidation products of paraffin waxes, etc., by distg. these materials, after conversion of any esters present into free acids and alcs., with steam or vapors of a volatile liquid at a pressure below 100 mm. at a temp. above the b. p. of the volatile liquid at the pressure chosen but below that at which the constituents

of the initial materials other than alcs. are distd. Among examples montan wax and the waxy cake obtained by sapon. of carnauba wax are thus treated.

**Aliphatic alcohols.** I. G. FARBENINDUSTRIE A.-G. Brit. 367,003, Nov. 5, 1930. Alcs. of high mol. wt., suitable for the *prepn. of ointments, creams* and *polishing compns.*, are made by reduction with H and a catalyst of the oxidation products of liquid or solid non-aromatic hydrocarbons, such as paraffin wax or oil, and the alcs. are then extd. from the product by water-sol. aliphatic alcs., or their esters with fatty acids contg. up to 3 C atoms, in the presence of $H_2O$.

**Aliphatic alcohols.** ROBERT B. LEBO (to Standard Oil Development Co.). Brit. 367,282, Aug. 28, 1930. A mixt. of alkyl sulfates, contg. appreciable amts. of secondary and tertiary compds., *e. g.*, isopropyl, secondary amyl, secondary hexyl, tertiary butyl and tertiary amyl sulfates, obtained by absorbing oil-refinery gas in $H_2SO_4$, is hydrolyzed and the alc. mixt., after sepn. from oil, is sprayed into a packed column heated at the base to about 107° by a countercurrent of steam. The aq. alc. is condensed and the aq. $H_2SO_4$ collected. App. is described.

**Hydroaromatic alcohols.** SCHERING-KAHLBAUM A.-G. Brit. 366,244, Jan. 25, 1930. See U. S. 1,857,880 (*C. A.* **26**, 3804).

**Esters.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,106, Sept. 22, 1930. Nitriles obtained by condensation of $C_2H_2$ with $NH_3$ or amines are sapond., *e. g.*, at 50–250°, while in the vaporous state and while adding a vaporizable alc. in the liquid or gaseous state and, if desired, O. In examples AcOEt is produced by sapon. of the nitriles with EtOH, and a mixt. of glycol monoacetate with a little glycol diacetate by sapon. with ethylene glycol. Cf. *C. A.* **27**, 996.

**Carboxylic acid esters.** I. G. FARBENINDUSTRIE A.-G. Brit. 367,680, June 16, 1930. Carboxylic acid esters, especially those of EtOH and PrOH, are obtained by heating mono- and dialkyl sulfates, or mixts. thereof with free $H_2SO_4$, with carboxylic acids such as formic, acetic or benzoic acid under conditions such that during the process, after any free $H_2SO_4$ initially present has been eliminated, no free $H_2SO_4$ or only very small amts. thereof appear. This may be effected by adding to the alkyl sulfates sufficient neutral sulfate, *e. g.*, $(NH_4)_2SO_4$, to fix any $H_2SO_4$ originally present or produced as acid sulfate or by first adding enough MgO, $Na_2CO_3$, etc., to neutralize the free $H_2SO_4$ and subsequently adding a further sulfate.

**Hydroxy carboxylic acid esters.** AKTIENGESELLSCHAFT FÜR STICKSTOFFDÜNGER. Brit. 366,443, July 29, 1929. See Fr. 699,675 (*C. A.* **25**, 3359).

**Glycol ethers.** ANGLO-PERSIAN OIL CO., LTD., STANLEY F. BIRCH and WM. D. SCOTT. Brit. 367,353, Oct. 17, 1930. See Fr. 725,245 (*C. A.* **26**, 4825).

**Organic compounds such as ketones and acids.** HEINRICH HOPFF and MANFRED DUNKEL (to I. G. Farbenind. A.-G.) U. S. 1,891,930, Dec. 27. For production of compds. such as propionic acid, ketones, etc., reaction is effected at over 10 atm. pressure between CO and Al or B halide such as $AlCl_3$ or $BF_3$ and a halogenated non-aromatic hydrocarbon such as EtCl or the like.

**Ketones from secondary alcohols.** HERRMAN SANDKUHL (to Rheinische Kampfer-Fabrik Ges. m. b. H.). U. S. 1,892,011, Dec. 27. See Fr. 696,658 (*C. A.* **25**, 2734).

**Hydroaromatic ketones.** OTTO DIELS and KURT ALDER (to I. G. Farbenind. A.-G.). U. S. 1,891,043, Dec. 13. Products of various flower-like odors are obtained by condensing hydroaromatic mono- or poly-cyclic aldehyde of the formula $CHY^1.CX:CX.CHY^2.CHX.CHCHO$, where at least one but not more than 3 of the positions marked X, $Y^1$ and $Y^2$ are occupied by methyl, the others by H, or $Y^1$ and $Y^2$ jointly stands for $—CH_2—CH_2—$ in which case the X's are H or one X is methyl, with ketones contg. the group $CH_3—CO$ (new $\alpha,\beta$-unsatd. hydroaromatic ketones being obtained). The aldehydes used may be obtained by condensing $\alpha,\beta$-unsatd. aldehydes as for instance acrolein, crotonaldehyde or the like with compds. which contain a system of conjugated double bonds as for instance butadiene, alkylbutadiene, cyclopentadiene or cyclohexadiene. As condensing agents there are used alk. products as for instance caustic alkalies, alc. K/Na methoxide or $Ba(OH)_2$. Numerous details of procedure and examples are given, for the production of products of the formula $CHY^1.CX:CX.CHY^2.CHX.CHCH:CHCOR$, where R stands for an org. radical of the group consisting of methyl, ethyl and phenyl, wherein at least one but not more than three of the positions marked X, $Y^1$ and $Y^2$ are occupied by methyl, the others by H or $Y^1$ and $Y^2$ jointly stand for $—CH_2—CH_2—$ in which case the X's are H or one X is methyl.

**Amides of the benzene, naphthalene and acenaphthene series.** LEONARD J. HOOLEY and JOHN THOMAS (to Scottish Dyes, Ltd.). U. S. 1,891,159, Dec. 13. A process involving submission of sulfonated aromatic amines of these series one or more times

to condensation with a nitro acyl chloride and reduction of the product to the corresponding amine after each condensation and then condensation of the product thus obtained with an aliphatic or aromatic acyl chloride which does not contain a nitro group, or the condensation of 1-naphthylamine-4,6,8-trisulfonic acid with *p*-nitrobenzoyl chloride followed by reduction and treatment with benzoyl chloride is applied to the production of compds. such as benzoyl-*p*-aminobenzoyl-*p*-aminobenzoyl-*p*-aminobenzoyl-*p*-aminobenzoyl-1-aminonaphthalene-4,6,8-trisulfonic acid as well as the following products which may be obtained intermediately: *p*-aminobenzoyl-*p*-aminobenzoyl-*p*-aminobenzoyl-*p*-aminobenzoyl-1-aminonaphthalene-4,6,8-trisulfonic acid; *p*-nitrobenzoyl-*p*-aminobenzoyl-*p*-aminobenzoyl-*p*-aminobenzoyl-1-aminonaphthalene-4,6,8-trisulfonic acid; *p*-aminobenzoyl-*p*-aminobenzoyl-*p*-aminobenzoyl-1-aminonaphthalene-4,6,8-trisulfonic acid; *p*-nitrobenzoyl-*p*-aminobenzoyl-*p*-aminobenzoyl-1-aminonaphthalene-4,6,8-trisulfonic acid. Numerous examples with details of procedure are given.

**Condensation products of the anthraquinone series.** ALBIN PETER (to Chemische Fabrik vorm. Sandoz). U. S. 1,891 317, Dec. 20. By condensing α-aminoanthraquinone with diethyl malonic ester (I) in the presence of a small proportion of NaOAc, a carbethoxypyridine m. 312–16° (decompn.) is obtained. Similarly, 1,5-diaminoanthraquinone and acetoacetic ester (II) yield a product which is probably a dianthrapyridone, a brown powder not m. below 360° and insol. in quinoline or other usual org. solvents. 1-Methylamino-4-bromoanthraquinone (III) and I form carbethoxymethyl-4-bromoanthrapyridone, m. about 184°. III and II form acetylmethyl-4-bromoanthrapyridone, m. about 242°. 1-Methylamino-5-chloroanthraquinone and II form 5-chloro-1-methylanthraacetylpyridone, m. about 263°. 1-Amino-2-methyl-4-bromoanthraquinone and I form a product m. about 311° (decompn.), and by using II there is formed acetyl-2-methyl-4-bromoanthrapyridone (decompd. at 350°). 1-Amino-2,4-dibromoanthraquinone (IV) and I form the carbethoxy-2,4-dibromoanthrapyridone, m. 292° (decompn.). IV with II forms acetyl-2,4-dibromoanthrapyridone, m. about 333° (decompn.). 1-Amino-4-methoxyanthraquinone (V) and II form acetyl-4-methoxyanthrapyridone, m 316° (decompn.). I and V form the carbethoxy-4-methoxyanthrapyridone, m. 292° (decompn.). 1,5-Aminohydroxyanthraquinone (VI) and I form the carbethoxy-5-hydroxyanthrapyridone, m. (after recrystn.) 311° (decompn.). VI and II form 5-hydroxyanthraacetylpyridone, m. (after recrystn.) 306° (decompn.). 1-Amino-2-bromo-4-*p*-toluinoanthraquinone and I form 4-*p*-toluino-2-bromoanthracarbethoxypyridone and corresponding products may be derived from the anilino, xylidino, chloroanilino, phenylenediamino and similar derivs. 1-Amino-2-methyl-4-bromoanthraquinone and benzoylacetic ester form a benzoylpyridone, does not m. below 350°. Besides NaOAc, there may be used as condensing agents other acetates, formates, nitrites, carbonates, borates and sulfites of alkali metals and other weakly basic compds. such as CaO or MgO. Numerous details of procedure are given.

**3-Aminoacridine and its substitution products.** I. G. FARBENINDUSTRIE A.-G. Brit. 367,024 Nov. 14, 1930. See Ger. 547,983 (*C. A.* **26**, 3522).

**Acridinium compounds.** I. G. FARBENINDUSTRIE A.-G. Brit. 367,037, Nov. 14, 1930. Divided out of 367,024 (preceding abstr.). Quaternary derivs. of 3-aminoacridines are prepd. by treating 3-aminoacridine, or such substitution products thereof as contain halogen, alkyl or alkoxy groups in the benzene ring not substituted by the amino group, all of which compds. are substituted in the amino group by a substituent which can be split off, *e. g.*, an acyl group, with an alkylating agent, and subsequently splitting off the substituent from the amino group. Among examples 3-aminoacridine is treated with $Ac_2O$, the acetyl deriv. is methylated with *p*-toluenesulfonic acid methyl ester and the product is sapond. with HBr or HCl, yielding 3-amino-10-methylacridinium bromide or chloride.

**Polymerized vinyl compounds.** IMPERIAL CHEMICAL INDUSTRIES LTD. Brit 366,897, Aug. 6, 1929. Void. Vinyl compds. are polymerized by treatment with a polymerization catalyst in the presence of a liquid medium which is a solvent for the initial material but not for the polymer produced. Among examples vinyl acetate is polymerized using high-boiling gasoline as solvent and benzoyl peroxide as catalyst.

**Auromercapto compounds.** BOOT'S PURE DRUG CO., LTD., and FREDERICK O. HOWITT. Brit. 365,760, Jan. 6, 1931. A Au deriv. of glutathione is obtained by treating glutathione with a soln. of a Au salt and pptg. and sepg. the product. Examples are given.

**Compounds of the indole series by catalytic hydrogenation.** CURT SCHUMANN, EDUARD MUENCH and BRUNO CHRIST (to I. G. Farbenind. A.-G.). U. S. 1,891,057, Dec. 13. In effecting production of dihydroindole from indoxyl, or in effecting similar reactions with homologs, *N*-acyl, or *N*-acyl-*O*-acyl compds. derived from indoxyl or naphthoindoxyl, a H-contg. gas is used with a hydrogenation catalyst such as a Ni-Cu catalyst.

**Compounds of the anthraquinone series such as aminoanthraquinones.** PHILIP H. GROGGINS. U. S. 1,892,302, Dec. 27. β-Aminoanthraquinone is formed by heating 2-chloroanthraquinone with aq. $NH_3$ in an autoclave under pressure in the presence of Cu, $KClO_3$ and $NH_4NO_3$ at a temp. of 150–225°. Similarly, α-aminoanthraquinone may be formed from α-chloroanthraquinone and other similar reactions are mentioned.

**Halogenation products of the ketimides of acenaphth-*peri*-indandione and its derivatives.** WILHELM ECKERT and HEINRICH SIEBER (to General Aniline Works). U. S. 1,891,148, Dec. 13. See Ger. 561,080 (*C. A.* **27**, 994).

**Tribromoethane derivatives.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,581, Nov. 6, 1930. Oxygenated derivs. of α-tribromoethane are made by acting on the corresponding derivs. of α-trichloroethane with bromides, either added as such or produced in the course of the reaction. Among examples tribromoethanol is produced from trichloroethanol by the action of Br and Al turnings.

**Biphenyl derivatives.** I. G. FARBENIND. A.-G. Fr. 739,053, June 24, 1932. 2,5-Dialkoxy- or 2,5-diaralkoxy-biphenyls are nitrated and then reduced to produce 4-nitro and 4-amino derivs. which are *intermediates for dyes*. Examples are given of the prepn. of 4-nitro-2,5-dimethoxybiphenyl (m. 102–3°) and of its following derivs.: 4'-methoxy (m. 106°), 4'-phenyl (m. 159–61°), 3'-chloro (m. 127°), 3',5'-dichloro (m. 149–50°), 4'-methyl (m. 167°), 2'-methyl (m. 86–7°), 2'-chloro (m. 132–4°), 4'-chloro (m. 152–3°), 4'-benzoylamino (m. 187°), 3',4'-dichloro (m. 137°), 2',4'-dichloro (m. 125–7°), 3'-(ω-trifluoromethyl) (m. 139–40°), 2',4'-dimethyl (m. 126–7°), 4'-methoxy-2'-chloro (m. 132–3°), 4'-methoxy-3'-chloro (m. 127–8°), 4'-chloro-2'-methyl (m. 150–1°), 2'-methoxy-5'-methyl (m. 112–13°), 2',4',5'-trichloro (m. 156–7°), 3',4',5'-trichloro (m. 190–1°), 2',5'-dimethoxy-4'-chloro (m. 187–90°), 2',4'-dimethoxy-5'-chloro (m. 192–3°), 3'-methyl (m. 114°), 2'-methoxy (m. 114–16°), 3'-methylsulfonyl (m. 192°), 2',5'-dichloro (m. 147–8°), 5'-chloro-2'-methyl (m. 110–11°). The m. p's. of the corresponding 4-amino compds. are 89°, 125–6°, 213–14°, 68–9°, 161–3°, 103–4°, 116–17°, 131–2°, 101–2°, 150°, 113°, 100°, 67–8°, 99–100°, 112–13°, 101–3°, 106°, 107–8°, 126–7°, 175–6°, 175–9°, 148–9°, —, —, —, —, —. The following derivs. of 4-nitrobiphenyl are also prepd., 2,5-diethoxy (m. 92°), 2,5-dibutoxy (m. 41–2°), 2,5-dibenzyloxy (m. 136–8°), 2,5-dibutoxy-3'-chloro (m. 60°), and 2,5-diethoxy-3'-methyl (m. 75–6°). The m. p's. of the corresponding 4-amino compds. are 72–3°, 52–3°, 117–19°, —, —. Cf. *C. A.* **27**, 1001.

**Chelidamic acid derivatives.** SCHERING-KAHLBAUM A.-G. Fr. 738,843, June 20, 1932. Alkali metal salts of *o*-alkyl or *o*-aralkyl-diiodochelidamic acids are prepd. by causing Ag salts of dialkyl esters of diiodochelidamic acid to react with alkyl or aralkyl halides and sapong. with alkalies. The products are used as *contrast agents for Röntgen rays*. Examples are given of the prepn. of *o-methyl-* (m. about 125°), *o-ethyl-* (m. 174° with decompn.), *o-propyl-* (m. 156° with decompn.), *o-butyl-* (m. 145° with decompn.), *o-benzyl-* (m. 167° with decompn.), and *o*-allyl-3,5-diiodochelidamic acid (m. 143–4° with decompn.).

**Nitro derivative of butylcymene.** HENRI BARBIER. U. S. 1,892,128, Dec. 27. A dinitro deriv. of *tert*-butylcymene which m. 132° and has a musk-like odor is obtained by nitrating *tert*-butylcymene with fuming $HNO_3$ at 0° or a lower temp.

**Polymerizing and condensing unsaturated compounds.** HERMAN A. BRUSON (to Resinous Products & Chemical Co.). U. S. 1,892,101, Dec. 27. Aryl diazonium fluoborates such as phenyldiazonium fluoborate are used as catalysts in obtaining polymers or condensation products from unsatd. compds. such as indene, styrene, cyclopentadiene, coumarone, phenylbutadiene, pinene, isoprene, constituents of cracked gasoline or Hevea rubber. Numerous examples with details of procedure are given.

**Use of carbonyls such as iron carbonyl in effecting polymerization of hydrocarbons such as butadiene.** OTTO AMBROS, HANS REINDEL, JULIUS EISELE and JOHANNES STOEHREL (to I. G. Farbenind. A.-G.). U. S. 1,891,203, Dec 13. Various details of operation are described.

**Potassium formate.** EMIL HENE. Brit. 366,556, Oct. 8, 1930. See Ger. 542,696 (*C. A.* **26**, 3339).

**Naphthenates.** I. G. FARBENINDUSTRIE A.-G. Brit. 367,666, June 2, 1930. Addn. to 335,863 (*C. A.* **25**, 1841). The method of 335,863 is modified by (1) effecting the drying *in vacuo*, preferably with the addn. of small amts. of readily volatile org. compds., *e. g.*, $C_6H_6$, and (or) (2) adding to the naphthenate, prior to or during the drying, liquid or readily fusible substances compatible with the naphthenate and reducing its m. p., *e. g.*, drying, semi-drying or non-drying oils, or their acids, or known plasticizers for cellulose derivs.; suitable addns. are linseed oil, castor oil, linoleic acid, triaryl phosphates, dialkyl phthalates, benzyl acetate, benzyl benzoate and butyl stearate. Cf. *C. A.* **26**, 2750.

**Derivatives of 2,3-hydroxynaphthoic acid.** I. G. FARBENINDUSTRIE A.-G. Brit.

366,140, Nov. 1, 1930. Alkoxy or alkylthio derivs. of 2,3-hydroxynaphthoic acid are made by the reaction of $CO_2$ under pressure on an alkali salt of an alkoxy or alkylthio deriv. of β-naphthol or on the free naphthol in the presence of an alkali carbonate. Among examples the Na salt of 6-methylmercapto-2-naphthol is treated with $CO_2$ to give 6-methylmercapto-2,3-hydroxynaphthoic acid. Cf. *C. A.* **27**, 1004.

**Substitution products of aminobenzenearsonic acid.** FRITZ MIETZSCH and HEINRICH KLÖS (to Winthrop Chemical Co.). U. S. 1,892,245, Dec. 27. By acylating the 4-(ω-aminoalkylamino)benzenearsonic acids or substitution products there are obtained new compds. of the probable general formula

AcNH—alk—NHC:CH.CR¹:C(AsO₃HR²).CH:CH, where Ac stands for a substituted or unsubstituted acyl group, for example, formyl, acetyl, propionyl, isobutyryl, valeryl, benzoyl, aminoacetyl, aminobenzoyl, etc., "alk" stands for an aliphatic normal or branched alkylene or hydroxyalkylene group, for example, methylene, ethylene, propylene, hydroxypropylene, isobutylene, etc., $R^1$ means H, OH or halogen, $R^2$ means H or an alkali or alk. earth metal. These new compds. possess a less basic character and are less sol. than the parent compds. and are distinguished by their stronger action against blood parasites, by a good resorption when taken *per os* and by their intoxicity. They are prepd. by boiling an org. acid of the stated kind with the 4-(ω-aminoalkylamino)benzenearsonic acid or a substitution product thereof or by the reaction upon the 4-(ω-aminoalkylamino)benzenearsonic acids or the substitution products thereof with an anhydride or a halide of the org. acids. The new products are preferably sepd. in the form of their alkali metal salts, if necessary, after adding the requisite amt. of a caustic alkali lye, for example, by evapg. the reaction mixt. to dryness, dissolving the residue in alc. and pouring the soln. obtained into a suitable org. precipitant, such as ether or acetone. Sometimes, however, the acids themselves sep. during the acylating process. The new acylated 4-(ω-aminoalkylamino)benzenearsonic acids and their alkali or alk earth metal salts are white or pale colored. The acids are sol. in inorg. acids forming the corresponding salts; they are also sol. in alkali lyes forming the corresponding alkali metal salts; they are insol. in acetone and ether and dil. HOAc and sparingly sol. in water and MeOH. The alkali metal salts dissolve in water and alcs., they are insol. in acetone and ether and can be pptd. by the latter from their alc. solns. Various examples are given, including the production of the Na salt of 4-ω-acetylaminoethylaminobenzenearsonic acid, the Na salt of 4-(ω-aminoacetylaminoethylamino)benzenearsonic acid, the Na salt of 4-(ω-acetylaminopropylamino)benzenearsonic acid, 4-(ω-benzoylaminoethylamino)benzenearsonic acid and 4-(ω-3′-aminobenzoylaminoethylamino)benzenearsonic acid. It is stated that corresponding derivs. may be obtained by reaction of higher aliphatic carboxylic acid chlorides such as decylic acid chloride or stearic acid chloride with 4-(ω-aminoalkylamino)benzenearsonic acids.

**Benzylmorphine salts.** ARTHUR STOLL and ERNST BURCKHARDT (to Chemische Fabrik vorm. Sandoz). U. S. 1,892,019, Dec. 27. See Fr. 709,787 (*C. A.* **26**, 1066).

**Acetylene chlorides.** I. G. FARBENIND. A.-G. Fr. 739,183, June 28, 1932. The gaseous mixts. obtained by the thermal or elec. production of $C_2H_2$, *e. g.*, from $CH_4$, are treated with Cl at a temp. between 80° and 146°.

**Guanidine thiocyanide.** GES. FÜR KOHLENTECHNIK M. B. H. (Wilhelm Gluud and Werner Schultze, inventors). Ger. 568,401, Dec. 13, 1930. See Fr. 728,156 (*C. A.* **26**, 5575).

**Halides of sulfonic acids.** I. G. FARBENIND. A.-G. Fr. 739,290, June 30, 1932 Salts of org. sulfonic acids are treated with benzenyl halides, such as $C_6H_5CCl_3$, or their substitution products, to form the halides. Examples are given.

**Saturated fatty acid nitriles.** WALTER REPPE and ULRICH HOFFMANN (to I. G. Farbenind. A.-G.). U. S. 1,891,055, Dec. 13. In forming a product such as propionitrile, a corresponding unsatd. aliphatic acid nitrile such as acrylic nitrile is subjected to catalytic hydrogenation in the presence of a Cu catalyst, under "mild conditions" of working.

**Bleaching crude fatty acids obtained by oxidizing hydrocarbons.** I. G. FARBENIND. A.-G. (Christoph Beck and Heinrich Diekmann, inventors). Ger. 568,130, Apr. 19, 1931. Addn. to 528,361 (*C. A.* **25**, 4728). The method of Ger. 528,361 is modified by using $HNO_3$ as the bleaching agent. The temp. and duration of the treatment may be lower than is recommended in Ger. 528,361. Cf. *C. A.* **26**, 5576.

**Acetic acid.** BRITISH CELANESE, LTD., HORACE F. OXLEY, WALTER H. GROOMBRIDGE and WM. CHALLIS. Brit. 366,022, Oct. 27, 1930. In the oxidation of liquid AcH to AcOH the gases or vapors leaving the reaction vessel are scrubbed with a liquid, preferably AcOH, and the scrubbings returned to the reaction liquor.

**Acetic acid.** HAROLD A. PATTERSON. Fr. 738,805, June 18, 1932. AcOH is made from a gaseous mixt. of MeOH and CO using a catalyst contg. W and one of the

following elements or mixts.: Be, Bi, Be and Bi, Be and Cu or Be, Bi and Zn. The major part of the active part of the catalyst is composed of oxide of W in which the oxidation state of the W is not below that represented by $W_2O_5$.

**Dehydrating acetic acid.** THE EASTMAN KODAK CO. Brit. 365,076, Oct. 14, 1930. See Can. 321,229 (*C. A.* **26**, 3265).

**Sulfonation of oleic acid.** FARB- UND GERBSTOFFWERKE CARL FLESCH, JR. Ger. 568,209, Aug. 25, 1923. Oleic acid is treated with an excess of $H_2SO_4$ at a low temp., and the product is freed from excess $H_2SO_4$ in known manner, washed if desired, and finally purified by dialysis. Sulfoöleic acids are thus obtained as solid hygroscopic substances. An example is given. The salts of the acids may be prepd. by standard processes, and *are of therapeutic value*. The prepn. of Hg and Cu salts is described.

**Carboxylic acids.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,997, Oct. 15, 1930. The destructive oxidation in the liquid state of difficultly volatile solid, semi-solid or liquid non-aromatic hydrocarbons of at least 8 C atoms or mixts. of such hydrocarbons or waxes is effected by blowing with a gas contg. free O in the presence of about 0.1–1% by wt. of the initial material of alk. catalysts consisting of alkali metal compds., the oxidation being carried on until the product has an acid value above 40 but not above 120. Colorless products, contg only very small amts. of hydroxy carboxylic acids and lactones, and suitable for working up into soaps and emulsifying agents, are thus obtained. Catalysts mentioned are NaOH, $K_2CO_3$ and the Na salt of a mixt. of carboxylic acids obtained by the destructive oxidation of paraffin.

**Hydroxy carboxylic acids.** ALEXANDER WACKER GES. FÜR ELEKTROCHEMISCHE INDUSTRIE G. M. B. H. Fr. 738,815, June 18, 1932. Aromatic hydroxy carboxylic acids are prepd. by the action on alkali or alk. earth compds. of phenols, naphthols, hydroxyquinoline, etc., with $CO_2$ in the presence of solvents. The free OH compds. may be used as solvents.

**Hydroxybenzocarbazolecarboxylic acids.** I. G. FARBENINDUSTRIE A.-G. Brit. 367,597, Mar. 19, 1930. See Ger. 553,627 (*C. A.* **26**, 5576).

**Benzanthrone-*peri*-dicarboxylic acid and its derivatives.** GEORG KRÄNZLEIN, HEINRICH GREUNE and HEINRICH VOLLMANN (to General Aniline Works). U. S. 1,892,241, Dec. 27. Benzanthrone-*peri*-dicarboxylic acid is prepd. by heating 4-benzoyl-1,8-naphthalic anhydride with $AlCl_3$ and is a yellow compd. the anhydride of which crystallizes from $PhNO_2$ in yellow needles m. above 300°. Various details and modifications of procedure are given. Chlorobenzanthrone-*peri*-dicarboxylic anhydride is formed by heating 4-*p*-chlorobenzoyl-1,8-naphthalic anhydride with $AlCl_3$, NaCl and successively added portions of powd. pyrolusite. Benzanthrone-*peri*-dicarboxylic acid-*N*-phenylimide is formed from 4-benzoyl-1,8-naphthal-*N*-phenylimide by heating with $AlCl_3$. It crystallizes from glacial HOAc as yellow needles m. above 300°.

**Anilinesulfonic acids.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,421, April 4, 1930. Addn. to 341,612 (*C. A.* **25**, 5041). See Ger. 541,258 (*C. A.* **26**, 1942).

**Sulfonic acids of piperidine, etc.** I. G. FARBENIND. A.-G. Fr. 738,842, June 20, 1932. Sulfonic acids of piperidine, tetrahydroquinoline and their alkyl homologs are prepd. by treating sulfonic acids or sulfonates of the pyridine or quinoline series with H in the presence of solvents and hydrogenating catalysts. Examples are given of the prepn. of *piperidine-3-sulfonic acid* (decomposed without melting at 320–330°), *α-pipecoline-β-sulfonic acid* (m. 315–320° with decompn.), *py-tetrahydroquinoline-6-sulfonic acid* (m. 258° with decompn.), *γ-pipecoline-β'-sulfonic acid* and *α-methyl-β'-ethylpiperidine-β-sulfonic acid*.

**Purifying non-volatile organic acids such as phthalic acid or the like.** ALPHONS O. JAEGER (to Selden Co.). U. S. 1,892,396, Dec. 27. For sepg. non-volatile org. acids which are capable of forming volatile anhydrides from relatively volatile org. acids or anhydrides, a mixt. of these with other assocd. org. substances volatile with steam is subjected to the action of steam at a temp. below that at which the non-volatile acid material would be transformed into anhydrides, to effect selective steam distn.

**Granulated phthalic anhydride.** LLOYD C. DANIELS and CHRISTIAN J. SCHWINDT. U. S. 1,891,754, Dec. 20. Phthalic anhydride in the form of granules having a hard glazed outer surface is prepd. by solidifying a liquid coating of phthalic anhydride upon the surface of solid phthalic anhydride particles.

**Granular crystalline material such as phthalic anhydride.** OSCAR V. D. LUFT and CHRISTIAN J. SCHWINDT. U. S. 1,891,891, Dec. 20. Solid particles of cryst. material are agitated and there is simultaneously added further quantities of the same material in molten form, so that the heat given off on solidification of the molten material is taken up by the solid product to produce a slowly hardened covering contg. interwoven crystals.

**Halogenated phthalic anhydrides.** CECIL SHAW and JOHN THOMAS (to Imperial Chemical Industries, Ltd.). U. S. 1,891,843, Dec. 20. A nitro-substituted phthalic

anhydride such as 3-nitrophthalic anhydride is treated with a halogen such as Cl until at least one nitro group is replaced by a halogen atom, suitably at a temp. of about 240°.

**Acetylene.** I. G. FARBENIND. A.-G. Fr. 739,289, June 30, 1932. $C_2H_2$ prepd. by thermal or elec. means is freed from biacetylene, allylene and other impurities by washing the gas with org. liquids such as $PhNO_2$, gas oil, halogenated hydrocarbons, mineral oils and fluid tars, under such conditions of temp. and pressure that the soly. of the $C_2H_2$ is small and that of the impurities high.

**Dichloroethylene.** CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE G. M. B. H. Brit. 366,348, May 8, 1930. See Fr. 714,995 (*C. A.* **26**, 1624).

**Acetone.** HANS MEERWEIN and HEINRICH MORSCHEL (to Schering-Kahlbaum A.-G.). U. S. 1,891,333, Dec. 20. Vapor of EtOH or acetaldehyde is passed, together with steam, over a contact mass contg. a mixt. of an oxide of Sn with an oxide of a rare earth metal or of Th, Zr or Zn or an alk. earth metal carbonate. Cf. *C. A.* **26**, 4347.

**Glycols.** ANGLO-PERSIAN OIL CO., LTD., ALBERT E. DUNSTAN and STANLEY F. BIRCH. Brit. 365,589, Sept. 18, 1930. See Fr. 725,150 (*C. A.* **26**, 4827).

**Glyoxalines.** BOOT'S PURE DRUG CO., LTD., ALEXANDER P. T. EASSON and FRANK L. PYMAN. Brit. 365,281, Dec. 20, 1930. 1-Substituted glyoxalines are prepd. by condensing acetalylthiocarbimide with an amine and converting the resulting thiocarbamide into the glyoxaline deriv. in known manner. Examples are given of the prepn. of 1-(8-quinolyl)glyoxaline, 1-$\beta$-hydroxyethylglyoxaline, etc.

**Protocatechualdehyde and its substitution products.** FRANZ ELGER (to Hoffmann-La Roche Inc.). U. S. 1,891,149, Dec. 13. By reaction of $H_2O_2$ in alk. soln. on compds. such as 4-hydroxyisophthalaldehyde, OH is substituted for the *o*-aldehyde group, forming protocatechualdehyde, etc. Similarly, 4-hydroxy-5-methoxyisophthalaldehyde yields the 3-methyl ether of gallaldehyde, m. 135°.

**1,7-Dihydroxynaphthalene.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,600, Nov. 8, 1930. 2,8-Dihydroxynaphthalene-6-sulfonic acid, 2,8-dihydroxynaphthalene-3,6-disulfonic acid, 7-amino-1-hydroxynaphthalene-3-sulfonic acid or 7-amino-1-hydroxynaphthalene-3,6-disulfonic acid is heated with dil. acid under pressure. $H_2SO_4$, HCl, HCOOH and $H_3PO_4$ are used in examples. Cf. *C. A.* **26**, 1000.

**Mercaptobenzothiazoles.** ALBERT M. CLIFFORD (to Goodyear Tire & Rubber Co.). U. S. 1,891,198, Dec. 13. See Brit. 357,760 (*C. A.* **26**, 5972).

**1-Phenyl-2,3-dimethyl-5-pyrazolone.** SOCIÉTÉ DES USINES CHIMIQUES RHONE-POULENC. Brit. 367,797, Nov. 19, 1930; Ger. 568,297, July 12, 1931. See U. S. 1,859,002 (*C. A.* **26**, 3808).

**Purifying 1-amino-2-chloroanthraquinone.** SCOTTISH DYES, LTD. Ger. 568,210, Sept. 14, 1926. A soln. of the crude product in concd. $H_2SO_4$ is dild. with water until the sulfate of 1-amino-2-chloroanthraquinone is pptd. The sulfate is sepd. and decompd. in known manner.

***l*-Menthol.** SCHIMMEL & Co. A.-G. (Otto Zeitschel and Harry Schmidt, inventors). Ger. 568,085, May 23, 1926. *d*-Neomenthol (I) is boiled for some hrs. with an alkali metal or a light metal *e. g.*, Mg or Al, or an alcoholate of any of these. A nonracemic mixt. contg. *l*-menthol (II) is obtained, which is enriched in II by standard processes, *e. g.*, by fractionation or crystn. or by esterification followed by partial sapon. II is then sepd. from the enriched mixt. as such or as *l*-menthyl benzoate, and the other menthol polymers obtained in the process, together with unchanged I, are boiled again with alkali metal, etc. II is obtainable similarly from *d*-isomenthol (III) or *l*-isoneomenthol (IV) or mixts. contg. them, such as the products obtained by hydrogenating optically active menthenones or menthenols. II may also be prepd. by converting I, III or IV or their mixts. into menthones, and reducing these to a mixt. of menthols, from which II is isolated as indicated above. Examples are given.

**3-Menthene.** SCHERING-KAHLBAUM A.-G. Brit. 367,593, Mar. 20, 1930. See Fr. 713,357 (*C. A.* **26**, 1626).

**Camphene.** RHEINISCHE KAMPFER-FABRIK G. M. B. H. Brit. 366,727, Mar. 21, 1930. See Fr. 711,011 (*C. A.* **26**, 1626).

**Separation of allo-*p*-ketocamphor from *p*-ketocamphor.** KENZÔ TAMURA, GYOKUZYO KIHARA, YASUHIKO ASAHINA and MORIZÔ ISIDATE. Japan. 94,795, Feb. 29, 1932. *p*-Ketocamphor obtained by oxidation of borneol ester contains its isomer, allo-*p*-ketocamphor, which is more sol. in petroleum ether (b. 30–50°) or pentane. They can be sepd. by means of these solvents.

**Biphenyl.** THOMAS E. WARREN and CHARLES B. DURGIN (to Swann Research, Inc.). U. S. 1,891,514, Dec. 20. $C_6H_6$ vapor is passed through a molten inorg. salt such as NaCl and $CaCl_2$ which has a m. p. below the biphenyl-forming temp. and which is inert to the $C_6H_6$ vapors and is heated to a temp. (suitably about 800°) suitable for biphenyl formation, and the resulting vapors are condensed. Cf. *C. A.* **27**, 103.

**Aminobiphenyls.** I. G. FARBENIND. A.-G. Fr. 739,052, June 24, 1932. Amino-

biphenyls and their derivs. are prepd. by causing, as far as possible in the absence of moisture, hydrocarbons of the $C_6H_6$ series to react on *N*-haloacyl derivs. of amino compds. of the $C_6H_6$ series in the presence of a metal halide having a condensing action and with or without a diluent, and sapong. the reaction product. Examples are given of the prepn. of the following derivs. of $Ph_2$: 3-methyl-4-acetamido, m. 158°; 3-methyl-4-amino, m. 43°; 3-carboxy-4-acetamido, m. 205–6°; 3-ethyl-4-acetamido; 3-ethyl-4-amino; 3,4′-dimethyl-4-acetamido, m. 199–200°; 3,4′-dimethyl-4-amino, $b_4$ 205–7°; 3-methyl-4-acetamido-4′-chloro, m. 226°; 3-methyl-4-amino-4′-chloro, m. 125°; the corresponding bromo compds.; 4-benzamido-3-methyl, m. 189°; 3,5-dimethyl-4-acetamido, m. 203–4°, and 3,5-dimethyl-4-amino.

**Chlorinated biphenyl.** RUSSELL L. JENKINS (to Swann Research, Inc.). U. S. 1,892,397, Dec. 27. In producing a product such as a chlorinated biphenyl, Cl gas is introduced into the bottom of a mass of material such as biphenyl in the presence of an Fe catalyst and flow of the material over the catalyst is induced by the action of the gas. App. is described and claim is made to a non-uniformly chlorinated biphenyl contg. 40–55% Cl and of specified viscosities depending on the Cl content.

**Mononitrobiphenyls.** ERNEST H. HUNTRESS, CAMPBELL R. MCCULLOUGH and CHARLES F. BOOTH (to Swann Research, Inc.). U. S. 1,891,543, Dec. 20. A suspension of biphenyl in an acid soln. contg. $HNO_3$ below substantial nitrating strength is treated with concd. $H_2SO_4$ to effect the nitration reaction.

**Styrene.** GEORGE L. DOROUGH (to E. I. du Pont de Nemours & Co.). U. S. 1,892,386, Dec. 27. In producing a vinylbenzene such as styrene, a quaternary salt of the corresponding halogenated ethylbenzene is formed, sepd. and broken down, as by heating the pyridine salt derived from chlorinated ethylbenzene at 275–300° under reduced pressure.

# 11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

## A—GENERAL

ARTHUR W. DOX

**Flocculation of coloring materials, chemically definite artificial colloids, in the organism.** MAURICE PIETTRE. *Compt. rend.* **196**, 298–300(1933).—Living histologic elements possess selective permeability to colloidal substances, in the absence of electrolytes. The absorption and the effects of various pos. and neg. colloidal coloring materials are considered. PHILIP D. ADAMS

**Recent advances in the study of enzymes.** B. WOOLF. *Nature* **129**, 928–30 (1932).—A summary of a recent discussion. B. C. A.

**Observations of the nuclear picture after hydrolysis and after "nucleal" staining. An additional contribution to the "nucleal" reaction.** HARTWIG KUHLENBECK AND KURT VOIT. *Anat. Anz.* **74**, 1–20(1932).—The "nucleal" reaction of Feulgen and Rossenbeck is based on the ability of thymonucleic acid in histological prepns. after mild partial hydrolysis at 60° in *N* HCl for 4 min. to split off guanine and adenine; the aldehyde groups thus freed can react with Schiff's reagent to form a bluish violet dye. The nuclear structure examd. in sections of liver and kidney of rats and mice was not altered by hydrolysis. Appearance and location of "nucleal" bodies revealed by the technic are described. B. C. BRUNSTETTER

**The formation of methylacetylcarbinol by enzyme action. II. Methylacetylcarbinol by enzyme action on proteins.** WALTER CIUSA. *Ann. chim. applicata* **22**, 747–53(1932); cf. *C. A.* **27**, 1058.—Methylacetylcarbinol is formed by the action of trypsin and papain on whole milk, egg white and blood serum. Hence the substance is derived, by enzyme action, from proteins and not from sugars. A. W. CONTIERI

**The specific action of lipase. III. The specific action of liver lipase of various animals.** JOSEPH C. KERNOT AND H. W. HILLS. *Z. physiol. Chem.* **215**, 8–9(1933); cf. *C. A.* **26**, 4070.—Lipase prepns. from the livers of 17 species of animals, both wild and domestic, were examd. for preferential cleavage of the optical isomers of Et *dl*-mandelate. In 13 cases the liberated acid was *d*-rotatory, in 3 it was optically inactive, and in 1 it was *l*-rotatory. Higher lipase content was found in the livers of domestic animals compared to those of wild animals. A. W. DOX

**The autoxidation of amino acid derivatives with animal charcoal and hemin. I.** FRANZ BERGEL AND KARL BOLZ. *Z. physiol. Chem.* **215**, 25–34(1933).—Active charcoal, from which the adsorbed gases have been removed by evacuation and replaced by $CO_2$-free $O_2$, catalyzes the oxidation of amino acids in an atm. of $O_2$. The 1st step in the reaction is probably a dehydrogenation to imino acid, since quinone, alloxan, methyl-

ene blue and other H-acceptors act in the same manner. The final products are aldehyde, $CO_2$ and $NH_3$. A comparison of alanine and leucine shows that the longer chain reacts much more rapidly. Dipeptides and diketopiperazines do not react at all. Monosubstitution and especially dialkyl substitution in the $NH_2$ renders the amino acid much more reactive, but further substitution to the betaine abolishes all reactivity. The N-substituted amino acids yield the corresponding mono- or dialkylamine instead of $NH_3$. Three possibilities for the 1st intermediate product here are the $NH_4$ base $R_2(OH)N{:}CR'CO_2H$, the amine oxide $R_2(O{:})NCHR'CO_2H$, and the amine peroxide $R_2(O_2)NCHR'CO_2H$. The 1st is excluded by the easy oxidation of $Me_2NCH_2CO_2H$ where the C chain is not capable of dehydrogenation, the 2nd by the stability of $Me_2(O{:})NCH_2CO_2H$, while the 3rd is rendered probable by the demonstration of active O by means of starch-KI. Dialkylamino acids, in contrast to the natural primary amino acids, are catalytically oxidized by hemin, evidently through the peroxide stage. On the other hand, the kidney enzyme which deaminates natural amino acids does not attack dialkylamino acids. The kidney enzyme is therefore a typical dehydrogenase, while hemin functions as an oxidase. Charcoal acts as either dehydrogenase or oxidase, depending on the substrate. A. W. Dox

**Catalase. V. The catalase activity of hemin complexes.** Kurt G. Stern. *Z. physiol. Chem.* **215**, 35–46(1933); cf. *C. A.* **27**, 109.—The activities of Fe ions, hemin and catalase, in terms of mols. of $H_2O_2$ decompd. in a given time under identical conditions, are represented by the values $10^{-5}$, $10^{-2}$ and $10^{5}$, resp. A no. of hemin complexes were prepd. in the hope of obtaining one or more with an activity approaching that of catalase. Among the simpler derivs. were complexes of protohemin with $MeNH_2$, glycine, pyridine, piperidine, α-picoline, *l*-tyrosine and nicotine, also with the imidazole derivs., imidazole, 4-methylimidazole, *l*-histidine, histamine, imidazolecarboxylic acid, benzimidazole and pilocarpine. The activities varied from $1.96 \times 10^{-2}$ to $8.65 \times 10^{-2}$ at the $p_H$ optima. Various hemin-protein complexes, including reconstructed hemoglobin, methemoglobin, hemochromogen and cathemoglobin, and the globin complexes of various hemins, gave values ranging from $0.37 \times 10^{-2}$ to $6.5 \times 10^{-2}$. In no case did the order of magnitude even remotely approach that of catalase. A. W. Dox

**Cleavability and solubility of sterol digitonides.** R. Schönheimer and H. Dam *Z. physiol. Chem.* **215**, 59–63(1933).—The sterol digitonides are much less stable and insol. than previously supposed. They tend to sep. into their components when recrystd. from a solvent. This property is advantageous in the purification of sterols, especially where oxidation and heating are to be avoided. After dissolving the digitonide in pyridine and pptg. the digitonin by $Et_2O$, the sterol is obtained pure by simple evapn of the filtrate. When the digitonide method is used in sterol analysis the greatest caution must be used in interpreting the results. Cholesterol, dihydrocholesterol and coprosterol, and their digitonides, all have different solubilities. The completeness of pptn. depends not only on the excess of precipitant used but varies also with different prepns. of digitonin. The error may be as much as 10%, or even greater in the examn of feces where all 3 of these sterols are present. A. W. Dox

**The directive influence of sulfhydryl on intracellular transformation of protein and carbohydrate.** E. Waldschmidt-Leitz, L. Weil and A. Purr. *Z. physiol. Chem.* 215, 64–6(1933).—Cathepsin, papain, glyoxalase and alc. fermentation all require activation by SH; arginase requires an SH-metal complex. $ICH_2CO_2H$ suppresses these enzyme activities by reacting with and destroying the SH. Where SH is an inhibitor, as with phosphatase, the addn. of $ICH_2CO_2H$ serves as activator for the same reason. SH compds. occupy a central position in directing intracellular transformation of protein and carbohydrate and the oxidoreduction processes. The preponderance of lactic acid fermentation in anaerobically developing cells, *e. g.*, malignant tumors, in consequence of lowered O potential, is effected by SH. A. W. Dox

**The prevention of alcohol precipitation of proteins by alkali.** Leonhard Nasch. *Kolloid-Z.* **62**, 93–7(1933).—The min. amt. of alkali required to prevent pptn. by alc is related to the no. of free $NH_2$ groups of the protein. Globulin only shows regularity in dil. soln. and below 33% alc. Arthur Fleischer

**Biophysical chemistry of colloids and protoplasm.** V. Cofman. *Chem. News* **145**, 1–3(1932). G. G.

**Vegetable proteins. I. Preparation of purified edestin.** G. Florence, J. Enselme and M. Pozzi. *Bull. soc. chim. biol.* **15**, 135–46(1933).—A method of prepg very pure edestin is described. Variations of the method yield edestins with slightly different optical properties. The purest product contained 18.7% N. Absorption spectrum curves are given. L. E. Gilson

**Some general remarks on the relative composition of the ultrafiltrant and ultrafiltrate [of protein solutions].** H. Chabanier, C. Lobo-Onell and E. Lélu. *Compt rend. soc. biol.* **112**, 147–50(1933). L. E. Gilson

**Some notes on the history of biochemistry.** H. D. Barnes. *J. S. African Chem. Inst.* **16**, 1–8(1933). E. H.

**Enzymes from the standpoint of the chemistry of invertase.** John M. Nelson. *Chem. Rev.* **12**, 1–42(1933).—A review. Methods of obtaining and purifying invertase are described and the kinetics of the hydrolysis of sucrose by invertase are considered. Numerous references are given. Louise Kelley

**Proteolytic enzymes and the coagulation of casein.** Sukeharu Nishimura. *J. Agr. Chem. Soc. Japan* **8**, 1323–34(1932).—Casein or milk is coagulated by taka-diastase, papain and pancreatin. When casein is partially hydrolyzed by protease of the tryptase type in the presence of Ca, coagulation may occur. Rennin could not be demonstrated in the protease prepns. With pepsin the coagulation occurs on a slight hydrolysis. The influence of temp., $p_H$ and absorption was the same for hydrolysis as for coagulation of casein by pepsin. Hence both hydrolysis and coagulation of casein may be attributed to the same enzyme (pepsin). Y. Kihara

**The chemical aspects of embryonic heterogony.** Joseph Needham. *Bull. soc. philomathique Paris* **115**, 11–57(1932).—Huxley's equation, $y = bx^K$, where $x$ represents the size of the total organism and $y$, the size of any one of its parts, is applied to data from the literature on embryonic growth. In general, the isogonic constituents are water, protein N and total P; those of pos. heterogony are total fats and heat values; those of neg. heterogony are phospholipides, phosphonucleins, nonprotein N, ash and org. extractives. Most of the lines are based on data for bird embryos but some are worked out for mammalian and human embryos. Emphasis is placed on the idea that heterogony affords a means for exact expression of the growth of an organism, as a whole, and of any of its parts, at any stage. Mary E. Lear

**The permeability and hemolytic action of the fatty acids and some of their halogen derivatives.** M. Bodansky. *J. Exptl. Biol.* **10**, 59–66(1933).—The halogen derivs. are more readily taken up by the red cells than the fatty acids. C. M. McCay

**Chemical constituents of biological importance in the English Channel, November, 1930, to January, 1932. I. Phosphate, silicate, nitrate, nitrite, ammonia.** L. H. N. Cooper. *J. Marine Biol. Assoc. United Kingdom* **18**, 677–728(1933).—The cyclical variations in the P, Si and various N forms in the waters of the English Channel have been detd. The anal. methods and their modifications for these elements are also given. **II. Hydrogen-ion concentration, excess base, carbon dioxide and oxygen.** *Ibid* 729–53.—The earlier findings of the cyclical variations of $p_H$ in the waters of the English Channel have been confirmed. During 9 months the partial pressure of $CO_2$ in the water is lower than that of the atm. The rate of transfer of $CO_2$ from the air to the sea is much greater than can be accounted for from existing lab. exptl. data regarding the rate of penetration of water by gases. Si is used several times over each season in building phytoplankton. About 1400 metric tons of phytoplankton develop each year under a sq. km. of water surface. About 0.06% of this phytoplankton is harvested as fish. C. M. McCay

**The specificity of hemoglobins including embryonic hemoglobin.** Hilda Trought. *Arch Disease Childhood* **7**, 259–62(1932).—Hemoglobins obtained from various sources appear to vary in the rate at which they are decompd. by 0.25 *N* NaOH. The time required for the disappearance of the $\alpha$- and $\beta$-absorption bands of oxyhemoglobin from normal and pathol. human bloods is 40–60 min.; from blood of newborn infants, 2 hrs.; from the blood of infants 1.5 months of age, 35–60 min.; from rabbit blood, 20–28 min. and from sheep blood, more than 5 hrs. E. R. Main

**A class experiment on coenzymic activity.** H. D. Jenner and H. D. Kay. *J. Lab Clin. Med.* **17**, 1272–3(1932). E. R. Main

**The question of identity of lipase and pancreatic esterase.** Giovanni Lo Monaco. *Arch intern. pharmacodynamie* **42**, 387–99(1932).—Data are given to show that temp. expts. are not always reliable for detg. whether 2 or more enzymic reactions are accomplished by one enzyme. P. F. Metildi

**Oxidative deamination of amino acids by methylglyoxal.** Bruno Kisch. *Biochem. Z.* **257**, 334–6(1933).—Of the several amino acids studied (glycine, glycylglycine, glycyltryosine, serine and alanine) glycine undergoes the greatest oxidative deamination in the presence of methylglyoxal, the opt. $p_H$ being 11. The dipeptides are deaminated only in mere traces. S. Morgulis

**The destruction spectrum of urease.** Fritz Kubowitz and Erwin Haas. *Biochem. Z.* **257**, 337–43(1933).—Urease prepd. according to Sumner was irradiated with ultra-violet rays ranging from 196 to 366 m$\mu$. The curves of the absorption spectrum of the urease and of the destruction of the enzyme coincide. S. Morgulis

**Plasma protein, cholesterol and the sedimentation rate in different animal species.** Bertil Swedin. *Biochem. Z.* **257**, 411–19(1933).—In the blood of cow, horse, dog, goat, hedgehog and rabbit no correlation was found between the concn. of the different

protein fractions and the sedimentation rate. Thus, cow blood with the highest fibrin content has the slowest rate of sedimentation. In a no. of bloods the sedimentation rate varies inversely with the amt. of easily extractable cholesterol. S. MORGULIS

**Optical activity and coagulation of the decomposition products of casein. II.** BR. JIRGENSONS. *Biochem. Z.* **257**, 427–36(1933); cf. *C. A.* **26**, 3530.—Hammarsten's casein was decompd. by heating with glycerol. The max. coagulation was found at $p_H$ 4.3 for the OH in 5.8 *M* concn. or 24%; EtOH 3.6 *M* or 22%; PrOH 2.1 *M* or 16%. At $p_H$ 6.9 max. coagulation occurs at 3.5, 3.0 and 2.6 *M*; at $p_H$ 7.4 at 2.2, 2.8 and 3.4 *M*, resp. There are also striking changes in optical rotation of the decompn. products. S. MORGULIS

**Origin of the primary catalase of cow milk.** ANTON ZEILINGER. *Biochem. Z.* **257**, 450–62(1933).—Generally there is an unmistakable parallelism between the daily av. values for the catalase content of the blood and of the milk of cows. The milk fat is also an important factor detg. the milk catalase, which is thus regarded as the resultant of these 2 independent factors. The milk catalase seems to vary inversely with the sp. gr. of the fat-free dry residue of milk, but varies directly with the total quantity. In cows of different ages and different phases of lactation the catalase activity on the av. is equiv. to 2.41 cc., 0.1 *N* $KMnO_4$ or 4.1 mg. $H_2O_2$. S. MORGULIS

**The rennin enzymes.** A. HEIDUSCHKA AND W. SCHMIDT. *Biochem. Z.* **257**, 463–6(1933).—Various condiments inhibit the rennin activity through liquidity or basicity or they stimulate it through their effect on viscosity, dispersion or acidity. Only phenols and tannins inhibit in spite of their acidity. The effect on the rennin manifests itself not only in the hindering or promoting of coagulation but also in the degree of fineness of the coagulem. S. MORGULIS

**The yellow oxidation enzyme.** OTTO WARBURG AND WALTER CHRISTIAN. *Biochem. Z.* **257**, 492(1933); cf. *C. A.* **27**, 1646.—A cryst. dye obtained from the yellow oxidation enzyme m. 321° (decompn.) and contains no ash, halogen or S. Dried *in vacuo* at 58° its elementary compn. corresponds to the formula $(C_{13}H_{12}N_4O_2)_n$ or possibly $(C_{12}H_{12}N_4O_2)_n$. S. MORGULIS

**Studies on vital oxidation of succinic acid in air or pure oxygen at different $p_H$ values.** JÖRGEN LEHMANN. *Skand. Arch. Physiol.* **86**, 291–304(1933).—The oxidation of succinic acid with succin-hydrogenase requires more $O_2$ in an O atm. than in air at $p_H < 7.4$ but less $O_2$ at $p_H > 7.4$, while at $p_H$ 7.4 the utilization of $O_2$ is independent of its partial pressure. S. MORGULIS

**The purity of different insulin preparations.** NIELS A. NIELSEN. *Skand. Arch. Physiol.* **86**, 305–10(1933).—The purity of an insulin prepn. is tested by its ability to produce primary hyperglucemia or, still better, glycogen mobilization in a perfused liver. Cryst. insulin is not identical with pancreas hormone. S. MORGULIS

**The iodine and goiter problem in New Zealand.** C. E. HERCUS AND H. A. A AITKEN. *J. Hyg.* **33**, 55–79(1933).—Common seaweeds on the Pacific Coast of Otago have an I content of the same order as similar species on the Pacific Coast of British Columbia. *Cystophora retroflexa* contains over 0.1% of I, of which 70–80% is inorg. Diiodotryosine is also present. Administration of anesthetics produces fluctuations in the concn. of blood I in rabbits, the effect persisting after removal of the thyroid, and apparently only the inorg. I being involved. New Zealand cabbage has goiterogenic properties for rabbits but to a smaller degree than American cabbage. J. T. M.

**Synthesis and enzymic cleavage of galactose-6-phosphoric ester.** BROR HVISTENDAHL. *Svensk Kem. Tids.* **44**, 156–62(1932); cf. *C. A.* **26**, 96.—Galactose phosphoric ester is prepd. from diacetone galactose and $POCl_3$ and isolated as the Ba salt. The Na salt at $p_H$ 8.8 is used in enzyme studies. Phosphatase from bone and kidney split off inorg. P, the former being the more active. The phosphate is split off by yeast and bound by carbohydrate and the $C_6H_{12}O_6$ fermented. From the fermenting mixt. a monophosphate galactose was isolated but this is not identical with the synthesized compd., having $[\alpha]$ +81° instead of +35°. A. R. ROSE

**Olof Hammarsten.** ANON. *Svensk Kem. Tids.* **44**, 311(1932).—Obituary. A. R. ROSE

**The mercury-reducing power of certain amino acids.** CH. SANNIÉ AND R. TRUHAUT. *Compt. rend.* **196**, 65–7(1933).—Nessler's reagent is reduced to Hg by glycine, serine, histidine, tryptophan, proline, creatine, creatinine, cystine, dihydroxyphenylalanine and phenyl-β-alanine (distinction from phenyl-α-alanine). It is not reduced by any other amino acids, but in some cases gives a yellow ppt. The reduction accounts for part, if not all, of the reducing power of plasma hydrolyzates, formerly ascribed to carbohydrates derived from the proteins. K. V. THIMANN

**Protein structure and protein hydration.** DOROTHY JORDAN LLOYD AND HENRY PHILLIPS. *Trans. Faraday Soc.* **29**, 132–48(1933).—A valuable theoretical paper, followed by a general discussion. FRANK URBAN

**Direct irradiation by ultra-violet light causes in the dog a slight decrease of the calcium content of the blood; subsequent removal of the parathyroids is, as usual, followed by lowered calcemia.** JEAN CHEYMOL AND ALFRED QUINQUAUD. *J. pharm. chim.* **16**, 233–5(1932); cf. *C. A.* **26**, 5631, 5632.—By direct exposure of 2 dogs to the light of a Hg-vapor lamp for 20 min. every other day for 3 weeks, normal calcemia was reduced by 4.6 and 8.2%, resp.; after the thyroid app. was removed, calcemia after 1 day had decreased by 30 and 27%, resp., and in both cases by 54% after survival, for 4 and 2 days, resp. S. WALDBOTT

**Physicochemical researches on suspensions prepared from proteins separated from serum by the acetone method.** CHARLES ACHARD AND AUGUSTIN BOUTARIC. *Compt. rend.* **195**, 1196–7(1932).—Sepd. proteins are suspended in $H_2O$ and the physicochem. characteristics compared with those of proteins in pure serum. The viscosity, optical density, surface tension and adsorption by C are measured. The results show that this method of sepn. respects the integrity of the protein mol., so long as the period of preservation is short. R. P. WALTON

**Coenzymes and banana respiration.** J. M. NELSON AND CATHARINE HEMPERLY. *J. Am. Chem. Soc.* **55**, 1102–6(1933).—An aq. ext. of crushed banana pulp contains material which activates the glucolytic action of yeast apozymase. Pressed juice from banana pulp also contains this activator. The aq. ext. may be heated to boiling for a few min. without loss of its activating property, but when evapd. on the steam bath to dryness at $p_H$ 6.4, it is rendered inert. The glucolytic activator is more resistant to acid ($p_H$ 1) than to alkali ($p_H$ 9.4). It dialyzes through a collodion membrane. The effect of the activator, in the crude ext., on yeast apozymase is much less than that of yeast cozymase; the effect is increased by small quantities of $MgCl_2$ but hardly at all by $Ac_2O$. The ext. from the banana pulp also contains phosphatase and carboxylase. C. J. WEST

**Supplementary notes to previous works on lecithins.** YOSHIKUNI YOKOYAMA AND BUNSUKE SUZUKI. *Proc. Imp. Acad.* (Tokyo) **8**, 490–1(1932).—Photomicrographs are given for 6 lecithins isolated from the human brain or soy beans; the unsatd. fatty acids are brominated in all cases. C. J. WEST

**A kind of am-hexose occurring in the organism.** YASHIRO KOTAKE AND MEIJI NISHIGAKI. *Proc. Imp. Acad.* (Tokyo) **8**, 507–10(1932).—It is believed that the tissues contain a previously unknown hexose, termed *vitamose*, characterized by its labile properties. It may be pptd. by $CdSO_4$ and liberated by $H_2S$; it yields a phenylosazone, m. 205° and a 2,4-dinitrophenylhydrazone, m. 240°. It resembles glutathione in many respects and may interfere with the detn. of glutathione in animal tissues. C. J. WEST

**The action of pancreatic extract on glycine in a glycerol medium.** R. WOLFF AND MLLE. LAFRANÇAISE. *Compt. rend.* **196**, 221–3(1933).—Two g. of a 3% soln. of glycine in glycerol was weighed into Erlenmeyer flasks with 4 g. of a glycerol ext. of fresh pork pancreas having a lipase strength of 60–65 Willstätter units. The water content was 13%. The flasks were kept at 37° and variations in the no. of COOH groups were followed by the method of Willstätter and Kuhn. Titrations of control solns. of glycerol ext. of pancreas showed a slight but progressive increase. In the glycerol medium the no. of COOH groups decreased slightly but irregularly. In the presence of 6% alc. the decrease was 20–30% depending on the $p_H$ (5–9). This work supports the hypothesis that pancreatic lipase can effect the biochem. esterification of amino acids. U. S. 1,892,247, Dec. 27. HCl of 5% strength is caused to act on a soln. of pancreas trypsin until the soln. has attained a $p_H$ of 3.5; the mixt. is allowed to stand for a short time and is then treated with a $Na_2CO_3$ soln. until a $p_H$ of about 8 is reached. Cf. *C. A.* **26**, 5591.

**Drying and curing casein curd.** FRANK L. CHAPPELL. U. S. 1,892,233, Dec. 27. Various details of app. and procedure are described relating to curing of casein particles by treatment in suspension with currents of heated air into which steam is injected.

## B—METHODS AND APPARATUS

STANLEY R. BENEDICT

**Tables for the microdetermination of urea in the blood and urine according to the method of E. K. Marshall as modified by Van Slyke and Cullen.** O. DA RIN AND C. PASTORINO. *Rass. clin. terap. sci. affini* **31**, 306–32(1932). LEWIS W. BUTZ

**Properties of collodion membranes from various nitrocelluloses.** W. LINNHOFF. *Kolloid Z.* **62**, 10–13(1933).—For osmotic measurements on hemoglobin solns., the membrane must be non-permeable to the colloidal constituent, have a high permeability for water and crystalloid electrolytes, and have mech. strength to withstand pressures to 150 cm. $H_2O$. The solns. must be prepd. from moisture-free chemicals and should be poured in a dry atm. Directions are given for prepg. satisfactory membranes from dil. solns. of high-viscosity nitrocelluloses. A. FLEISCHER

**The composition of the unsaturated fatty acids of animal tissues.** H. G. SMITH. *Proc. Iowa Acad. Sci.* **38**, 171–2(1931).—Very little information is available as to the compn. of the unsatd. fatty acids of animal tissues, especially as regards the location of the double bonds. This is a report of preliminary expts. on the fatty acids of beef heart-muscle and liver. The unsatd. acids were sepd. by 2 methods of crystn of the Br derivs. and fractional distn. of the Me esters. The method of Armstrong and Hilditch was used for the oxidation of the unsatd. acids and the results obtained up to this time indicate that the first double bond nearest the carboxyl group is in the 9·10 position. Azelaic acid is the only dibasic acid which has been sepd. from the oxidation products. Evidence of the formation of other dibasic acids has been obtained, but these have not been identified as yet. W. G. GAESSLER

**Application of ultrafiltration to the determination of blood sugar in biological chemistry.** HERMANN SCHMIDT-HEBBEL. *Anales quim. farm.* **2**, 15–18(1933); cf. *C. A.* **27**, 128.—The prepn. and use of collodion filters are described. Of the total Ca of whole blood, 27–30% is present in the serum in colloidal form, retained by the filter, or 45–50% in the plasma. L. E. GILSON

**Technic of the ultrafiltration of blood plasma and laked corpuscles.** H. CHABANIER, C. LOBO-ONELL AND E. LÉLU. *Compt. rend. soc. biol.* **112**, 142–6(1933). The app. and methods of prepg. collodion bags are described. L. E. GILSON

**The comparative value of chlorobenzene and thymol when used with fluoride as preservatives of blood for chemical analysis.** ROBERT C. LEWIS AND GLENN E. MILLS. *Am. J. Clin. Path.* **3**, 17–28(1933).—Samples of blood to which 0.275 g. KF and 0.2 g PhCl per 20 cc. of blood have been added may be preserved for 8 days without appreciable changes in their nitrogenous constituents. The combination, PhCl and KF, appears to be a more effective preservative than thymol and KF. E. R. MAIN

**Hemoglobin standards.** RUSSELL L. HADEN. *Am. J. Clin. Path.* **3**, 85–95(1933). E. R. MAIN

**An improved method for the determination of blood urea nitrogen by direct nesslerization.** WALTER F. TAYLOR AND WM. M. BLAIR. *J. Lab. Clin. Med.* **17**, 1256–63 (1932).—The blood is allowed to react with a highly concd. prepn. of urease which is pptd. with the proteins by $Na_2WO_4$ and $H_2SO_4$. The filtrate may be nesslerized directly. E. R. MAIN

**A simple vacuum-tube potentiometer for the measurement of glass electrode potentials.** H. B. VAN DYKE AND RALPH D. BENNETT. *J. Lab. Clin. Med.* **17**, 1268–71 (1932). E. R. MAIN

**A new ureometer.** C. CARREZ. *Bull. sci. pharmacol.* **40**, 22–8(1933). A. E. MEYER

**Supplement to T. Osuka's semi-micro method for the determination of carbon in biological fluids.** H. R. KANITZ. *Biochem. Z.* **257**, 361–2(1933); cf. *C. A.* **26**, 2480.—Biol. fluid absorbed by anhyd. $Na_2SO_4$ is oxidized by a mixt. of $K_2Cr_2O_7$, $H_2SO_4$ and $Ag_2Cr_2O_7$, and the $CO_2$ is absorbed under diminished pressure in 2 *N* KOH. The $K_2CO_3$ is changed to $BaCO_3$ which is easily centrifuged off and after washing is dissolved in a measured amt. of 0.1 *N* HCl, the excess acid being titrated with 0.1 *N* NaOH with 2–3 drops of a satd. alc. soln. of methyl red as indicator. S. MORGULIS

**Summary analysis of the unknown urinary substances.** K. HAGENGUTH. *Bio-*

*chem. Z.* **257**, 484–91(1933).—Dil. 4 cc. urine with 16 cc. $H_2O$, add 132 cc. MeOH, exactly 8 cc. 2 *N* HCl and 20 cc. 10% xanthydrol in MeOH. Filter the cryst. ppt. through a Jena glass tube 4, wash with MeOH and weigh after drying 20 min. at 80°. The wt. times 0.035645 gives the urea content per cc. urine. Neutralize the filtrate and washings with 2*N* NaOH and evap. to dryness *in vacuo* at 35–40°. Dissolve the residue in a little water and ext. 3–4 times with small amts. of purest ether to remove xanthydrol so that the last ext. leaves no residue on evapn. Acidify the soln. with $H_2SO_4$ and make up to 15 or 25 cc. with water. Treat another sample of urine with an equal vol. of a specially prepd. phosphotungstic reagent, shake 2–3 hrs. and filter through dry kieselguhr. Det. N on 1 cc. original urine, and on 2–3 cc. of the first and 3–6 cc. of the second filtrate, by the usual semi-micro Kjeldahl procedure. For the oxidation use 1–3 cc. and absorb the $CO_2$ in 2*N* KOH under diminished pressure. Ppt. the carbonate as $BaCO_3$ at boiling temp., centrifuge off and wash twice. Dissolve the $BaCO_3$ in a known amt. of 0.1 *N* HCl and titrate the excess with 0.1 *N* KOH; 1 cc. 0.1 *N* HCl equals 0.6 mg. C. The O detn. is carried out according to Kanitz (preceding abstr.).

S. MORGULIS

**A new microanalysis for the determination of uric acid in urine and blood.** ISTVÁN RUSZNYÁK AND ELLA HATZ. *Biochem. Z.* **257**, 420–6(1933).—The method follows essentially the most recent Folin technic.

S. MORGULIS

**The determination of blood types by the use of saliva.** H. MORI. *Japan. Z. Mikrobiol. Path.* **26**, 1438–50(1932).—The detn. of blood type was successful with saliva in 89% of the tests, as compared with human blood serum results, and was pos. in 92% with saliva over a year old.

## C—BACTERIOLOGY

CHARLES B. MORREY

**Bacteriophage and the root-nodule bacteria.** D. G. LAIRD. *Arch. Mikrobiol.* **3**, 159–93(1932).—The bacteriophage is not sp. to one strain or species of *Rhizobium*. The optimum $p_H$ is 7.6–8.0. Gum produced by the bacteria inhibits bacteriolysis. Mannitol favors both gum formation and acid production.

B. C. A.

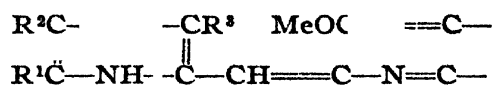
**B. caryocyaneus [Beijerinck-Dupaix] in a medium containing lithium.** P. LASSEUR, P. VERNIER, A. DUPAIX AND J. MARCHAL. *Compt. rend.* **194**, 1606–8(1932).—The presence of Li in a medium in which *B. caryocyaneus* is grown induces morphological changes assocd. with alterations in the permeability of the bacterial membranes and in the stability of suspensions of the bacteria in the presence of cations or of agglutinating serum.

B. C. A.

**Production of fluorescence by phytopathogenic bacteria.** F. LABROUSSE. *Compt. rend.* **194**, 2173–5(1932).—*B. tabacum* and *B. medicaginis* (var. *phaseolicola*) when grown on a beef ext. medium give rise to a definite fluorescence, but only when Mg and phosphate are present.

B. C. A.

**Thermal resistance of young and old bacteria and young and old bacteriophage.** BØRGE HEIBERG. *Z. Hyg. Infektionskrankh.* **114**, 425–8(1932).—The technic used failed to distinguish between young and old coli bacteriophage by thermal resistance although such differences can be observed between young and old cultures of *Es. coli*.



RACHEL BROWN

**Acid-alcohol mixtures and their germicidal action. I.** GEORG LOCKEMANN AND WERNER ULRICH. *Z. Hyg. Infektionskrankh.* **114**, 548–601(1932).—The germicidal action of acid (HCl and HSCN) is increased by the addn. of increasing amts. of EtOH, and solns. of low concn. of EtOH have increased germicidal activity when mixed with acid. Solns. of acid and alc. which alone are ineffective are strongly germicidal when mixed. The optimum sporicidal action is found in a mixt. contg. 7.5 to 12.5 molar HCl in 44 to 73% (vol.) alc.

RACHEL BROWN

**Prodigiosin, the red pigment of Bacillus prodigiosus. III.** FRITZ WREDE AND ALEXANDER ROTHHAAS. *Z. physiol. Chem.* **215**, 67–78(1933); cf. *C. A.* **26**, 5601.—In previous attempts to elucidate the structure of prodigiosin, $C_{20}H_{26}ON_3$, by a study of its decompn. products, a serious difficulty has been the failure to obtain cryst. substances other than simple end products. Two reactions, *viz.*, distn. with NaOH-CaO and oxida-

tion with $H_2O_2$ in AcOH, have now been found to yield well defined compn. products. Distn. of prodigiosin with NaOH-CaO, also distn. with Zn dust and reduction with HI-AcOH gave a pyrrole, $C_{10}H_{17}N$, which formed no picrate but coupled with $HO_3SC_6H_4N_2Cl$ to form an azo dye. Hydrogenation of the pyrrole gave a pyrrolidine $C_{10}H_{21}N$ which formed a chloroaurate m. 105° and a chloroplatinate m. 212° (decompn.). Treatment of the pyrrolidine with $Me_2SO_4$ introduced 2 Me groups, the product forming a cryst. chloroaurate which sintered 75° without sharp m. p. Oxidation of prodigiosin by $H_2O_2$ gave an oily product which was methylated by $CH_2N_2$ to a cryst. product, $C_6H_7O_2N$, m. 127° without basic properties. This contained 1 double bond, 1 MeO and 1 MeNH group Its properties suggested a *N-methylmethoxymaleic imide*. The latter was synthesized by converting hydroxymaleic anhydride into the *monoamide of methoxymaleic acid* m. 179.5° (evolution of gas) by treatment with $CH_2N_2$ and $NH_3$-MeOH, dehydrating this to *methoxymaleic imide* m. 169°, and methylating with $CH_2N_2$. The product was identical with the methylated oxidation product of prodigiosin. The imide evidently results from oxidation of a methoxylated pyrrole ring in prodigiosin. This and the $C_{10}H_{19}N$ pyrrole ring are present in a *dipyrrylmethene* structure. A 3rd ring contg. $C_4H_5N$ is lost in the oxidation. For the 1st 2 rings the structure

is proposed, with $R^1 + R^2 + R^3 = C_6H_{12}$. A. W. Dox

**Comparative growth rates of different strains of Rhizobium meliloti.** R. H. Walker and Dean A. Anderson. *Proc. Iowa Acad. Sci* **38**, 333–4(1931); cf. *C. A.* **25**, 1020, 2799.—The results seem to indicate that the organisms which are less efficient in fixing N grow faster in the presence of combined N or may require it for their growth; and that the more efficient organisms grow faster in the absence of combined N and may even be inhibited by its presence. M. G. Gaessler

**Chemical composition of bacteria. "Acid soluble" nitrogen and phosphorus compounds.** André Boivin and Lydia Mesrobeanu. *Compt. rend. soc. biol.* **112**, 76–9 (1933).—Suspensions of various species of bacteria (also yeast) were centrifuged and the sedimented puree was mixed with 10 vols. 0.25 *N* $CCl_3CO_2H$. After standing 3 hrs. in the ice box the mixt. was again centrifuged and the clear soln. analyzed. The cells were not changed in appearance by the treatment but 5–20% of the total N and 10–25% of the total P, depending on the species, were extd. by the acid. Grinding the cells with sand in the acid soln. did not increase the extn. of N and P compds. L. E. Gilson

**Bacteriophage and secondary lysis.** E. Wollman and Mme. E. Wollman. *Compt. rend. soc. biol.* **112**, 164–5(1933); cf. *C. A.* **26**, 4623.—During the lysis of bacteria by bacteriophage, anaerobiosis, bile, etc., enzymes are set free which can in turn produce lysis of cultures of the same species which are resistant to the original factor employed. It is proposed to call this enzymic lysis *secondary lysis*. L. E. Gilson

**Antiseptic action and surface tension. Action of three isomeric nitro-β-aminoethylaminoquinolines.** Daniel Bovet and Lucie Demanche. *Compt. rend. soc. biol* **112**, 270–2(1933).—8-Nitro-7-β-aminoethylaminoquinoline has very little antiseptic power and does not lower the surface tension of water. 5-Nitro-8-β-aminoethylaminoquinoline inhibits the growth of *E. coli* and *St. aureus* in 1:1000 soln., and in 1% soln lowers the surface tension 16 dynes (static method). 8-Nitro-5-β-aminoethylaminoquinoline has intermediate properties. L. E. Gilson

**Spectral properties of the pyocyanine secreted by Gessard's bacillus.** E. Vellinger. *Compt. rend. soc. biol.* **112**, 303–5(1933).—A method of isolating the pigment is described. The spectral absorption curves of the blue form ($p_H$ 9) and red form ($p_H$ 3) are given. The pigment changes color at $p_H$ 5–6. **Spectral properties of the pyoflavine which normally accompanies the pyocyanine in cultures of Gessard's bacillus.** *Ibid* 306–8.—The method of prepn., absorption curves and dissocn. curve are given. L. E. Gilson

**Action at a distance by Bacillus tumefaciens on rabbit bone marrow.** Eugénie Soru and R. Brauner. *Compt. rend. soc. biol.* **112**, 623–5(1933); cf. *C. A.* **27**, 118.—The expts. reported in *C. A.* **27**, 118 were repeated on *B. tumefaciens*, with substantially the same results. L. E. Gilson

**A study of the phosphorus distribution in bacterial cultures. III. The phosphatase activity of E. coli and staphylococcus.** J. Gordon and K. E. Cooper, *Brit. J. Exptl Path.* **13**, 503–8(1932).—When a suspension of killed bacteria, *E. coli* or staphylococcus, is incubated with a soln. of Na β-glycerophosphate, an increase in the inorg. P content of the liquid occurs as a result of (1) enzymic hydrolysis of the glycerophosphate, (2) enzymic hydrolysis of org. P compds. present in the bacteria, (3) non-enzymic hydrolysis of P compds, and liberation of inorg. P from the bacterial protoplasm into soln. The

magnitude of the second cause of increase (autolysis) appears to be greater than the first (glycerophosphatase action) with *E. coli*, and less with staphlococcus, but in both the presence of glycerophosphatase is definitely established. The third cause varies in magnitude for each strain chosen, and may assume considerable importance in accounting for the amt. of hydrolysis obtained. Finally, at $p_H$ 8.0–8.7 the non-enzymic hydrolysis of glycerophosphate (< 5%) is considered negligible. HARRIET F. HOLMES

**A silica bacterium.** A. BRUSSOFF. *Arch. Mikrobiol.* **5**, 1–22(1933).—*Bac. siliceus* n. sp. is described. It was isolated from the slime about wells. It is able to store and deposit silica particles in the spore or vegetative form. MILTON LEVY

**The bactericidal action of organic acids and their copper salts.** ALEXANDER JANKE AND FERDINAND BERAN. *Arch. Mikrobiol.* **5**, 54–71(1933).—The antiseptic and microbiosidal actions of a series of org. acids and their Cu salts on *M. albus*, *B. prodigiosum*, *Bac. subtilus*, *T. roseum* and *Monilia cinera* are detd. and tabulated. The potencies of the acids and salts are parallel. MILTON LEVY

**Biochemistry of bacterial spores.** ARTTURI I. VIRTANEN AND L. PULKKI. *Arch. Mikrobiol.* **5**, 99–122(1933).—Spores and vegetative forms of *Bac. mycoides* do not differ in their contents of water, ether-sol. material, hydrolyzable carbohydrates, N, or ash nor in their hygroscopic behavior. Catalase and glucolytic activity are assocd. with the vegetative form and not with the spore and the peptidase activity of the spores is much less. It is suggested that these differences in enzymic activity are related in the thermostability of the spores. MILTON LEVY

**A method for the proof of rennin formation by bacteria.** CONSTANTINO GORINI. *Arch. Mikrobiol.* **5**, 123–30(1933).—The coagulation of sterilized milk poured over a well-developed agar culture of the organism to be tested is observed. Rennin formation occurs independently of the presence of milk. Long periods of observation show that parasitic bacteria form rennin and that it is formed by bacteria previously considered inactive and which do not liquefy gelatin. MILTON LEVY

**Further studies on the influence of surface tension on the action of certain disinfectants.** G. MAZZETTI. *Boll. soc. ital. biol. sper.* **7**, 1396–400(1932); cf. *C. A.* **26**, 2761.—The reason why the lowering of surface tension does not increase the germicidal action of salicylic acid is probably due to the low $p_H$ of the soln. which might prevent the concn. of the disinfectant on the surface of liquid phase. PETER MASUCCI

**The influence of sugar concentration on acid fermentation by certain bacteria.** V. CIANCI. *Boll. soc. ital. biol. sper.* **7**, 1439–42(1932).—*E. coli*, *B. bulgaricus* and *B. massol* were each grown in broth contg. 0.1, 0.5 and 1.0% glucose. In the 0.1% glucose broth *E. coli* produced a max. amt. of acid within 24 hrs.; the amt. gradually decreased so that at the end of the 5th day the culture was slightly alk. The other 2 organisms did not behave similarly. They produced gradually increasing amts. of acid with max. values very much higher than that of *E. coli*. At higher glucose concns. *E. coli* either failed to produce a substance which neutralized the acid, or if it did, it was masked by the acid reaction. PETER MASUCCI

**The use of Bacillus acidophilus for clinical purposes.** CURBELO AND A. HERNÁNDEZ. *Anal. vias dig. sangre nutr.* **2**, No. 4 (1930); *Rev. sudamericana endocrinol. inmunol. quimioterap* **15**, 693(1932).—*Lactobacillus acidophilus* Moro is preferable to *L. bulgaricus*. Cultures of not more than 48 hrs. in sugar broth or milk are most effective. A. E. MEYER

**Lactic acid in culture media of microörganisms.** P. LAVIALLE AND P. R. BOHN. *Bull. sci. pharmacol.* **40**, 20–2(1933).—When culture media or their $Et_2O$ ext. is evapd. lactic acid is lost. For detn. wash the $Et_2O$ ext. with a sufficient vol. of volumetric NaOH, then with $H_2O$ and evap. the united alk. solns. Titrate back. If sepn. of the lactic acid from non-volatile acids is desired, add an almost equiv. quantity of HCl to the alk. liquid and distil with steam. A suitable app. is described. A. E. MEYER

**Effect of iodopyridone derivatives on streptococci.** A. BINZ AND H. MAIER-BODE. *Biochem. Z.* **257**, 351–60(1933).—Expts. with iodopyridone derivs. show that in proper org. combination even large quantities of I may be entirely non-toxic. S. M.

**The influence of inorganic salts on the multiplication of the gonococcus.** C. PHILLIP MILLER, JR., A. BAIRD HASTINGS AND RUTH CASTLES. *J. Bact.* **24**, 439–55 (1932); cf. *C. A.* **26**, 2211.—Na and K were interchangeable and non-toxic at high concns. Ca and Mg were unessential but inhibited growth at concns. greater than 30 millimols per l. Citrate and oxalate nullified the toxic action of Ca but not of Mg. Growth occurred between $p_H$ 6.0 and 8.2 with optimum growth at 7.0–7.6. Unless the media were well buffered either with bicarbonate or phosphate, growth did not occur. Chloride was replaceable by nitrate or sulfate without impairment of growth. JOHN T. MYERS

**A note on reaction changes during sterilization of vegetable extract culture media.** L. S. MCCLUNG. *J. Bact.* **24**, 457–9(1932).—In some cases the reaction change was

quite marked. The most marked change was in alk. solns. of carrot and tomato. Adjustment of the reaction with sterile acid and alkali after sterilization was more satisfactory than calcn. of sterilization changes and adding the reagents before sterilization or the use of buffers. JOHN T. MYERS

**Types of bacteria on blood and chocolate agar with the immediate cause of these types.** EINAR LEIFSON. *J. Bact.* **24**, 473–83(1932).—In the $\alpha$-$H_2O_2$ type of colony, the oxyhemoglobin is first reduced to hemoglobin. In an unknown way the hemoglobin is changed to methemoglobin and then to hematin and globin, or hematin may be formed directly from the hemoglobin. Hematin reacts with $H_2O_2$ to produce a green pigment. In the $\alpha$-$H_2S$ type of colony, the green color is due to the interaction of $H_2S$ and hemoglobin to form sulfhemoglobin, which is oxidized to a green compd. Many strains of *E. typhosus* which fail to blacken an ext. of $Pb(OAc)_2$ agar will blacken infusion agar. If cysteine or $Na_2S_2O_3$ is added to infusion blood agar, green is produced by many bacilli which otherwise do not. Hence a standard technic must be employed in detecting the formation of a green color as it is influenced by environment. JOHN T. MYERS

**The production of hydroxylamine by the reduction of nitrates and nitrites by various pure cultures of bacteria.** GLEN A. LINDSEY AND CHESTER M. RHINES. *J. Bact.* **24**, 489–92(1932).—Hydroxylamines were demonstrated as a reduction product of nitrates and nitrites in broth cultures of *A. aerogenes, Staph. aureus, B. subtilis, B. vulgatus, B. ramosus* and *B. anthracoides.* The fact that these organisms represent such a diversity of types strongly suggests that the production of hydroxylamine is characteristic of the bacterial reduction of nitrates. JOHN T. MYERS

**Rationalization, from the viewpoint of physical chemistry, of the behavior of bacteria toward dyes, with special reference to staining.** ALLEN E. STEARN. *J. Bact.* **25**, 21–3(1933).—The concept that the bacterial cell is an equilibrated system of 2 classes of components, the one more distinctly acidic than the other, which as a system is also amphoteric, is useful in correlating its behavior toward chem. agents, especially dyes. This view is strengthened by the fact that simple synthetic systems of this type are amphoteric, and show great buffering power at their isoelec. point. Bacteria are amphoteric. They retain basic dyes better on the alk. side, and acid dyes better on the acid side, of the isoelec. point. The reaction between dye and bacterial constituents seems to be stoichiometric. Dye specificity is governed by the relative dissocns. of the dye-bacteria salts. The action of I in the Gram stain is on the bacterial cell and is an amplification of the inherent differences in the isoelec. point. There seems to be no essential difference between the mechanism of dyes as stains and as bacteriostatic agents. JOHN T. MYERS

**The relation between the bacteriostatic action of gentian violet and the oxidation-reduction potential of the medium.** MARY A. INGRAHAM AND E. B. FRED. *J. Bact* **25**, 23–4(1933).—Non-lethal doses of gentian violet prolong the lag period but have little effect on subsequent growth or the fermentation products. There is no difference in oxidation-reduction potentials with and without gentian violet. Gentian violet acts as a poising agent in many bacteriol. media. The addn. of a given amt. of oxidizing or reducing agent has less effect on the oxidation-reduction potential in the presence of the amt. of dye used in bacteriostatic work than in its absence. At optimum potentials for growth, the dye has the least effect. Other poising agents, as ferric $NH_4$ sulfate, differentiate between tolerant and sensitive species of bacteria as does gentian violet. It is concluded that the bacteriostatic action of gentian violet is a function of its poising capacity, rather than of its ability to form a dye-protein compd. in the bacterial cell. JOHN T. MYERS

**The stimulation of bacterial metabolism by bacteriophage.** J. BRONFENBRENNER *J. Bact.* **25**, 25–6(1933).—The swelling of bacteria under the influence of bacteriophage is due to an intracellular accumulation of metabolic products with a consequent increase in osmotic imbibition of water. JOHN T. MYERS

**The stimulating effect of potato extract on the butyric acid bacteria.** E. L. TATUM AND W. H. PETERSON. *J. Bact.* **25**, 26–7(1933).—The stimulating factor was present in varying amts. in Irish and sweet potatoes, but was lacking in corn, oats, rice and semi-synthetic media contg. glucose or starch. It is stable to heating and drying, destroyed by ashing, sol. in water and in 80% alc.; insol. in ether, acetone and 95% alc., dialyzable through viscose and collodion membranes; not adsorbed on norite, silica gel or kaolin; not pptd. by phosphotungstic acid, $Ba(OH)_2$, or ammoniacal Pb acetate. It was carried down by the pptn. of $BaSO_4$ in the presence of $NH_4OAc$, and could be recovered from this by treatment with $NH_4OH$. JOHN T. MYERS

**The oxidation-reduction character of agar media and the growth of aerobic bacteria.** L. W. BROWN AND I. L. BALDWIN. *J. Bact.* **25**, 29(1933).—Small concns. of strong reducing agents as Na thioglycollate or hyposulfite may be beneficial to aerobic growth, but if enough is used to give reasonable poising the potential becomes too low. A mild

reducing agent as thiosulfate is better. Small amts. of peroxide or permanganate cause the formation of sub-surface zones of growth or diffuse growth throughout the medium.
JOHN T. MYERS

**The growth of Bacillus megatherium in relation to free oxygen and the oxidation-reduction potential of the medium.** GEORGES KNAYSI AND S. R. DUTKY. *J. Bact.* **25**, 30–1(1933).—*B. megatherium* can grow in media of low potential if free O is present, and is inhibited in media of high potentials in the absence of free O. It is inhibited by highly reducing substances. Free O seems to be the important factor.
JOHN T. MYERS

**A study of the bactericidal, bacteriolytic or inhibitory substance produced by some molds and some factors which influence its production.** ROGER D. REID. *J. Bact.* **25**, 31(1933).—The substance inhibited the growth of *C. diphtheriae in vitro* but had no *in vivo* protective action, and was non-toxic to guinea pigs. It is non-dialyzable through a collodion membrane.
JOHN T. MYERS

**The utilization of certain substituted sugars by bacteria.** STEWART A. KOSER AND FELIX SAUNDERS. *J. Bact.* **25**, 32(1933).—The substitution of a Me group for the H of the OH group attached to the no. 1 C atom made the sugar mol. less vulnerable to bacterial attack. α-Methyl mannoside was not fermented by organisms which ferment mannose. Similarly β-methyl *l*-arabinoside and β-methyl *d*-xyloside were not fermented. Glucose ethyl mercaptal gave neg. results.
JOHN T. MYERS

**The influence of cations on bacterial sporogenesis in a liquid medium.** F. W. FABIAN AND C. S. BRYAN. *J. Bact.* **25**, 33–4(1933).—Cations of univalent chlorides stimulate aerobic sporogenesis, while those of bi-, tri- and quadrivalent chlorides do not.
JOHN T. MYERS

**The effect of various substances upon fat production by B. megatherium, B. mycoides and B. albolactis.** J. CARVEL SPARROW. *J. Bact.* **25**, 36–7(1933).—Comparison of the results with the 3 organisms on 16 kinds of media showed no parallelism between growth (total dry wt.) and fat production. However, there were gains in fat in cultures where the total dry wt. falls below that of the controls. This may result from catabolic processes rather than synthesis and storage.
JOHN T. MYERS

**Gelatinolysis by aerogenic anaerobes.** G. L. STAHLY AND C. H. WERKMAN. *J. Bact.* **25**, 37–8(1933).—The Hg-protein method of Frazier or changes in viscosity are the best methods for the routine detn. of gelatinolysis.
JOHN T. MYERS

**Agar-coagulating bacteria.** A. P. HITCHENS. *J. Bact.* **25**, 39(1933). J. T. M.

**Some effects of salt on the morphology of Bacillus megatherium.** OLGA A. SMITH. *J. Bact.* **25**, 49(1933).—Induced changes were due to current conditions and were not permanent.
JOHN T. MYERS

**A variable proteus-like organism fermenting carbohydrates without gas formation.** H. J. SEARS AND MARTHA ROHNER. *J. Bact.* **25**, 50–1(1933).
JOHN T. MYERS

**Respiration studies on Rhizobia from various leguminous plants.** C. E. GEORGI, P. W. WILSON AND W. H. PETERSON. *J. Bact.* **25**, 53(1933).—The respiratory quotient of the culture varied from 0.90 to 1.10, the majority being slightly greater than 1.0. The rate of O consumption increased slightly with the O pressure. In cultures contg. 1.0% glucose, all the C from this source was used; with 2.0% glucose, 50–70% was used.
JOHN T. MYERS

**The effect of nitrogen source on oxygen consumption by Rhizobium.** R. H. WALKER AND D. A. ANDERSON. *J. Bact.* **25**, 53–4(1933).—Yeast ext. increased the rate and extent of O consumption by all strains. Urea, alanine, $NH_4Cl$ and $NaNO_3$ caused a moderate increase with *Rh. meliloti*, but not appreciably with *Rh. leguminosarum*, *trifolium* or *phaseoli*. Such a stimulation may be due to other constituents in yeast as carbohydrates, vitamins or salts.
JOHN T. MYERS

**Calcium-precipitating bacteria from mud of a fresh-water lake.** FRED T. WILLIAMS AND ELIZABETH MCCOY. *J. Bact.* **25**, 57–8(1933).—Carbonate pptn. by pure cultures was demonstrated on a solid medium prepd. with mud ext. without addnl. Ca.
JOHN T. MYERS

**A method for detecting chymase production by bacteria.** CONSTANTINO GORINI. *J. Bact.* **25**, 65–6(1933).—A sensitive method for the detection of rennin is to cover well developed agar slants with milk sterilized at not over 100° and incubate.
JOHN T. MYERS

**Some new heat-resistant, acid-tolerant organisms causing spoilage in tomato juice.** ROBERT N. BERRY. *J. Bact.* **25**, 72–3(1933).
JOHN T. MYERS

**Organisms which decompose the specific carbohydrates of pneumococcus types II and III.** GRACE M. SICKLES AND MYRTLE SHAW. *J. Bact.* **25**, 99(1933).—Several such strains of soil organisms were isolated from decaying vegetation. One strain also utilized agar.
JOHN T. MYERS

**Relation of changes in morphology and metabolism in E. coli.** WM. F. LANGE.

*J. Bact.* **25**, 123–42(1933).—When *E. coli* is grown in a synthetic medium there are alterations of morphology which are apparently cyclic. These changes cannot be correlated with $p_H$ or with the utilization of ingredients of the media. J. T. M.

**Some factors involved in the biological production of acetone and butyl alcohol.** Louis Weinstein and Leo F. Rettger. *J. Bact.* **25**, 201–38(1933).—An alc.-sol. protein or closely allied substance seems necessary for the production of normal amts. of acetone and Bu alc. from carbohydrates in a semi-synthetic medium. $p_H$, method of aerobiosis, oils, concn. of peptone and type of medium apparently had no effect on the Bu alc. production when prolamine was present in some form. In the presence of prolamine or similar substances, acetone and Bu alc. are formed from xylose, arabinose and glucose, in a ratio of 1:2. In the absence of alc.-sol. protein, normal amts. of acetone are formed, but little or no Bu alc. Acid hydrolysis of such raw substances as sawdust, peanut hulls and cottonseed hulls gave good yields of fermentable sugars, which were increased by a second and more intense hydrolysis. Fermentation of such hydrolyzates in the absence of prolamines produced acetone only. The addn. of yellow corn which contains the alc.-sol. protein, zein, stimulates the production of both acetone and Bu alc. Prolamine does not act as a catalyst, or not solely so, and is not the source of Bu alc. Prolamine favors Bu alc. production, through a combination of phys. action and direct influence on the metabolism of *Cl. acetobutylicum*. John T. Myers

**Specific antibacterial properties of penicillin and potassium tellurite.** Alexander Fleming. *J. Path. Bact.* **35**, 831–41(1932).—Penicillin and K tellurite have very selective antibacterial powers. In almost all cases a bacterium which is penicillin-sensitive is tellurite-insensitive and *vice versa*. John T. Myers

**Hemolysin and toxin of cholera and related organisms.** M. A. Gohar. *Zentr. Bakt. Parasitenk. I Abt.* **126**, 61–8(1932).—Atm. O favors the growth of vibrios and also independently the production of hemolysin. Saprophytic vibrios are less unfavorably influenced by its absence than others. The difference between hemolytic and non-hemolytic strains is quant., not qual. Hemolytic strains produce a powerful exotoxin which is probably identical with the hemolysin. Exotoxin and hemolysin are both adsorbed with lipoids as cholesterol or with brain or adrenal tissue which are rich in lipoids, but not with kaolin. John T. Myers

**The value of "oligodynamic" silver water in biological research.** Franz Eichbaum. *Zentr. Bakt. Parasitenk. I Abt.* **126**, 128–34(1932).—The efficiency of oligodynamic Ag water can be relied on only in biol. research. Quant. chem. Ag detns. and ion measurements cannot be relied on in all cases. A "standard Ag water" contains 480 γ Ag per l. This will kill 5000 colon bacilli in 2 hrs. at 37°. John T. Myers

**Experiences with the blood water tellurite culture plates of Clauberg.** Fred Himmelweit. *Zentr. Bakt. Parasitenk. I Abt.* **126**, 152–6(1932).—These culture plates are better than Loeffler's medium for the detection of diphtheria bacilli. John T. Myers

**Variants of Bacterium paratyphosus B which produce no gas from glucose.** H. A. W. Pot and A. Tasman. *Zentr. Bakt. Parasitenk. I Abt.* **126**, 348–51(1932); cf. *C. A.* **27**, 322.—Seven strains of non-gas-forming Schottmüller type, paratyphoid bacilli regained the ability to produce gas from glucose when grown in broth contg. 2% of Na formate. John T. Myers

**The inhibition of spreading in the colon-typhoid and proteus groups by salts.** V. Dimitrijević-Speth. *Zentr. Bakt. Parasitenk. I Abt.* **126**, 437–45(1932).—A variety of inorg. salts and some dyes can inhibit spreading. Two inhibitive salts exert an additive effect. The spreading of typhosus and paratyphosus was not inhibited. John T. Myers

**The problem of direct and indirect action in chemotherapy. IV. The mechanism of the action of bismuth on spirochetes.** I. L. Krichevskii and N. V. Kagen. *Zentr. Bakt. Parasitenk. I Abt.* **126**, 568–80(1932).—*Leptospira icterohemorrhagica* is killed by the direct action of Bi prepns. John T. Myers

**Egg culture media for the tubercle bacillus [amino-egg media].** Jos. Hohn. *Zentr. Bakt. Parasitenk. I Abt.* **127**, 59–64(1932); cf. *C. A.* **26**, 166.—The growth of tubercle bacilli was inhibited by Cu or Sn but not by their alloys. Au, Ag, Pb, Pt and Zn did not interfere with growth. Instead of mixing eggs with glycerol broth they were added to the following base: $Na_2HPO_4$ 1.5, $KH_2PO_4$ 2.0, $MgSO_4$ 0.3, Mg citrate 1.25, alanine 2.0, asparagine 3.0 g. and distd. water 500 cc. John T. Myers

**Respiration by facultative aerobic pathogenic bacteria.** H. Braun and K. Guggenheim. *Zentr. Bakt. Parasitenk. I Abt.* **127**, 97–104(1932).—The $p_H$ and the oxidation-reduction potential have much to do with the respiration of bacteria. The inhibiting action of KCN depends also on these factors. In diphtheria cultures the anaerobic growth of diphtheria bacilli was much less easily injured by KCN with an unfavorable $p_H$ on the acid side than on the alk. side on beef infusion dextrose agar. KCN affected

the growth of streptococci more in the alk. range. In the cultivation of microörganisms not only sources of C, N and salts but also catalyst must be considered. J. T. M.

**The oxidation and reduction properties of proteus bacilli and the influence of antibodies and of antiseptics.** H. BRAUN AND J. V. VASARHELYI. *Zentr. Bakt. Parasitenk. I Abt.* **127**, 105–11(1932).—Proteus bacilli can cause the dehydrogenation of formic and lactic acids, but the reaction is inhibited by phenol or trypaflavine. Bacteria which are laden with agglutinins bring about dehydrogenation much more slowly than do normal bacteria. JOHN T. MYERS

**The utilization of oxygen and the reduction of nitrates by diphtheria bacilli.** O. EHRISMANN. *Zentr. Bakt. Parasitenk. I Abt.* **127**, 111–16(1932).—In the utilization of O, not only must there be reducible substances present but one or more substances of the coenzyme type. The presence of cystine favors the reduction of nitrates to nitrites by diphtheria bacilli, but does not affect the action of pseudodiphtheria bacilli. JOHN T. MYERS

**The course of the d'Herelle phenomenon considered as a bacterial catabolism.** W. SEIFFERT. *Zentr. Bakt. Parasitenk. I Abt.* **127**, 122–32(1932).—The lytic agent is not a protein from the bacterial cell but an intermediate product of bacterial metabolism. A part of this product goes over to known measurable chem. substances. A further study of the bacterial products of metabolism in the bacteriophage phenomenon should be made. JOHN T. MYERS

**Studies on bacterial metabolism with the apparatus of Haldane.** ANDOR UHROVITS. *Zentr. Bakt. Parasitenk. I Abt.* **127**, 254–63(1933).—The R. Q. was detd. for a no. of varieties of pathogens and saprophytes. On agar media at room temp. the R. Q. never rose above 0.90, the av. being 0.67, although most of the O was consumed and much $CO_2$ produced. On horse protein media the R. Q. was about 0 35, although a great deal of O was used and $CO_2$ produced. Some of the O must have been built into carbohydrate, protein and fat for the bacterial cell body. *B. anthracoides* and *B. bipolaris septicum* produced free N. JOHN T. MYERS

**The cleavage of crocein by bacteria of the colon-typhoid group.** N. VAN DER WALLE. *Zentr. Bakt. Parasitenk. I Abt.* **127**, 360–3(1933). JOHN T. MYERS

**Theory of the alkali metal ion action on Escherichia coli.** FRANZ LIEB. *Zentr. Bakt. Parasitenk. I Abt.* **127**, 364–7(1933). JOHN T. MYERS

**The role of potassium nitrate among the gas-inhibiting factors in cheese.** A. F. WOJTKIEWIEZ. *Zentr. Bakt. Parasitenk. II Abt.* **87**, 349–60(1933).—The aerogenes group is inhibited because it reduces nitrate to nitrite. The colon-aerogenes group is more sensitive to nitrite than is the lactic acid group. The crit. concn. for the former is 0.04% of $KNO_3$. Free N is almost never formed by bacterial action, nitrites being reduced to $NH_3$ and then built into bacterial protein. JOHN T. MYERS

**Botanical description of the butyric acid splitting species of spore-forming bacteria.** W. WERNER. *Zentr. Bakt. Parasitenk. II Abt.* **87**, 446–75(1933).—There is a mass of biochem. detail concerning the cultures. JOHN T. MYERS

**Bacteria in the urinary tract. II. Resistance of the isolated bacteria to physico-chemical action—their toxicity.** G. AKITA. *Japan. Z. Mikrobiol. Path.* **27**, 198–226 (1933).—The resistance of bacteria isolated from the urinary tract (*Staphylococcus*, *Escherichia coli*, etc.), against heat, alkali and acid was studied. **III. The bactericidal power of various disinfectants against the bacteria isolated from the urinary tract.** *Ibid* 228–54.—Various disinfectants used for the urinary tract showed marked bactericidal action against bacteria isolated from the tract. I. S. YUN

Hydroxyphenyl alkyl sulfides (MILLER, READ) **10.**

**Organization of the plant cell membrane.** MAX LÜDTKE. *Cellulosechemie* **12**, 169–75, 191–5(1932); cf. *C. A.* **24**, 3531.—Studies were made to det. if chem. combination exists between cellulose and other cell-wall components, and if every cellulose or carbohydrate element of the secondary wall is surrounded by its own "skin" which is loosely bound to neighboring units. Pieces of pine (*Pinus sylvestris*), spruce (*Picea excelsa*), beech (*Fagus silvatica*), wheat straw (*Triticum vulgare*), hemp straw (*Cannabis sativa*) and bamboo (*Bambusa spec.*) were cut lengthwise and at angles of 30°, 40°, 70° and 90° into sections of 10–60 μ, with a microtome. Sections were treated with $ZnCl_2$ or saved in distd. water and then so treated, and their morphological characteristics studied. If cutting was done so that cell walls were not disturbed morphologically, then a yellow

color only was observed. If cells were disturbed, as easily happens with marginal or very thin cells, the membranes show greater or less blue color. Pressing the section temporarily intensified the blue coloration. Phloroglucinol-HCl and aniline sulfate reactions were not influenced by pressure. L. concludes that the "skin" substance of the middle layer cells is not the same as the *lignin* of the middle lamellae. Carbonized and partly acetylated sections were used to study "cross elements." Fibers from hemp, pine and bamboo were freed by 0.2% $Cl_2$ water and 1% $NH_3$, partly acetylated, washed, treated on a microscope slide and studied. The membrane breaks up into fibrils and fibril bundles. No cellulose fibrils, at right angles or tangential to the primary layer fibrils, were observed. Fibrils from pine cellulose varied in length from 36 to 72 $\mu$, from hemp bast fibers from 40 to 90, and from bamboo bast fibers from 25 to 50. L. regards fibrils, not arranged according to the long axes to be in an unnatural position because of pressure, tension in breadth and contraction in length, and observed no arrangement of fibrils confirming the hypotheses of Ritter, Scarth and Freudenberg. Present evidence is regarded as insufficient to interpret polarization-optical observations. The layers of isolated fibers which are approx. in contact with the outer layer of the secondary lamellae, called the "primary layer" by Freudenberg, are not regarded by L. as a definite entity in respect to morphology, function or chemistry. L. does, however, regard the primary lamellae he describes as a morphological entity and the "cross elements" as an integral part of all fibers. 22 photomicrographs. C. A. Brautlecht

**The distribution of nitrogen compounds and their fixation in the leaves of green plants.** E. Parisi and G. De Vito. *Atti accad. Lincei* **16,** 270–4(1932).—It is shown that the stems and buds of plants contain the highest amts. of amino N, being followed by roots, and lastly by leaves, which contain the least. It is also shown that the N contents of leafy limbs are higher in the afternoon than in the morning because of the action of light in assisting N fixation. A. W. Contieri

**The distribution of some reserve substances in [the] hard winter wheat plant at successive growth stages and their possible utilization.** R. C. Malhotra. *J. Agr. Sci.* **22,** 485–96(1932).—Data are reported on the percentages, at different dates, of ash, ether ext., moisture, sugar, starch, hemicelluloses and total N in hard winter wheat plants grown under natural conditions in the 1930–1931 season. The moisture content appeared to be lowest during the periods of min. vegetative activity and to be highest when conditions favored growth. The ether ext. did not show a definite trend, but reached a max. at the time of grain development. Ash was highest at the seedling stage, decreased gradually up to Feb. 14th, increased again to the end of April and then declined. Sugar was at a min. in the seedling stage, increased to Jan. 15th, declined slightly in the next month, reached a max. in April and then declined. In general, the starch declined from the seedling stage; all seemed to have been utilized during the later stages of growth and either stored during the development of the grain or transformed into other plant constituents. Hemicelluloses increased from the beginning to a max. on April 15th and then decreased. The total N increased gradually from the start with a max. in the later growing stages. P. R. Dawson

**The amounts and distribution of some phosphorus and nitrogen compounds in wheat during growth.** Frank Knowles and J. E. Watkin. *J. Agr. Sci.* **22,** 755–66 (1932); cf. *C. A.* **26,** 3540.—A study is reported of the lipin, phytin and inorg. P, and of the protein and non-protein N present in the wheat plant, from 7 weeks before ear emergence until harvest. The percentage of lipin P remained fairly const. in the whole plant until ear emergence, when a sharp decline occurred until 3 weeks before harvest, after which time it again remained const. The same was true of the straw, and of the ears after the latter had emerged. The percentage of phytin P in the whole plant was fairly const. throughout growth; in the straw there was a regular decrease up to harvest; the ear showed a marked increase until 3 weeks before harvest. The percentage of inorg P fell steadily in the whole plant, straw and ear until 3 weeks before harvest. During the last 2 weeks it remained const. in the ear, whereas the straw had become completely depleted. In the whole plant there was a higher proportion of the P in lipin form during the period of most active growth. In the earlier stages the bulk of the plant's supply of P was in the inorg. form; but this was steadily converted into phytin until 3 weeks before harvest. The high proportion (95%) of the total P of the straw in phytin form by the time assimilation of the element had ceased is due to the complete migration of inorg. P to the ear. In newly formed ears most of the P (over 80%) was in inorg. form; the lipin P was also relatively high and at its max. about 9%; the phytin P was low. During the period of active "filling" of the ears, the inorg. P was steadily converted into phytin, until about 50% of each was present. The percentages of total N and non-protein N in the whole plant, straw and ears, diminished until 4 weeks after ear emergence and then remained fairly const. The percentage of protein N in the whole plant fell until 2 weeks after ear emergence and then remained const.; in the straw it fell until about a week

before harvest; the percentage in the ears rose appreciably in the 2 weeks following emergence and then fell regularly until 2 weeks before harvest. There is evidence that, in the whole plant, straw and ears, the phytin P and protein N rise and fall concurrently and show close relationship, which, however, may not imply more than that these substances are the finally elaborated products of P and N. The distribution of the P in the compds. considered was such that at harvest 75% of the phytin, 80% of the lipin and all of the inorg. P were in the ear. In the case of protein and non-protein N, about 80% had been transferred to the ear. P. R. DAWSON

**Enzymic histochemistry. III. The proteinases of Drosera rotundifolia.** HEINZ HOLTER AND K. LINDERSTRØM-LANG. *Z. physiol. Chem.* **214**, 223–40(1933); cf. *C. A.* **26**, 2764.—The microtechnic previously used in detg. the activity of peptidases in small amts. of plant material has now been applied to a study of the proteinases of the insectivorous sundew, *Drosera rotundifolia*. By using edestin as substrate the demonstration of 2 proteinases was accomplished and their distribution in the leaves detd. The 1st is secreted by the glandular hairs and shows max. activity at $p_H$ 3.2. The 2nd occurs as endoenzyme in the leaf tissue and its optimum $p_H$ is 4.3. The proteinase of the glandular secretion is probably different from animal pepsin, but its function is undoubtedly to digest the protein of entrapped insects. A. W. DOX

**Measurements of arginine content in chlorophyll-defective leaves.** HANS v. EULER AND DAGMAR BURSTRÖM. *Z. physiol. Chem.* **215**, 47–50(1933).—Chlorophyll-normal and chlorophyll-defective mutants of barley showed no difference in arginine content as detd. colorimetrically in the germinated seedlings. On the other hand, variegated *Pelargonium* leaves showed 50–100 times as much arginine in the white border as in the green interior of the leaf pattern. A. W. DOX

**Variations in the organic reserves in underground parts of five perennial weeds from late April to November.** A. C. ARNY. Minn. Agr. Expt. Sta., *Tech. Bull.* **84**, 28 pp.(1932).—The carbohydrate and nitrogenous reserves in the underground storage organs of quack grass (*Agropyron repens*), Canada thistle (*Circium arvense*), leafy spurge (*Euphorbia esula*), Austrian field cress (*Nasturtium austriacum*) and sow thistle (*Sonchus arvensis*) showed sharp declines from late Apr. through early May in the percentages of total sugars and total readily available carbohydrates in each of the weeds except quack grass. The total readily available carbohydrates in the storage roots of leafy spurge and Austrian field cress reached low points for the season by May 15th, at which time they were beginning to bloom. Rapid storage of these substances followed for a time and continued at slower rates to the close of the season. In sow and Canada thistles, the declines were very rapid at first and continued at more moderate rates until blooming time in early July. Reserves were accumulated from that time to the end of the season. The rhizomes of quack grass were lower in both percentage and lb. per acre of total readily available carbohydrates at the time the first detns. were made in the spring than at any other sampling date. Starch decreased and sugars increased with the approach of cool weather in the fall in the case of sow and Canada thistles and leafy spurge. This was not true of quack grass or Austrian field cress. Total org. N rapidly declined in the early part of the season in sow thistle and Austrian field cress, and less rapidly in the case of Canada thistle, leafy spurge and quack grass. These declines continued at more moderate rates to Aug., after which increases occurred. Though cutting Canada thistles in full bloom delayed growth the following year, there was no marked lowering of the org. reserves in the storage roots. C. R. FELLERS

**Some poisonous plants of New Jersey.** JESSIE G. FISKE. N. J. Agr. Expt. Sta., *Bull.* **261**, 3–30(1932).—The poisonous toxalbumin present in *Amanita phalloides* is phallin. The mushroom normally has a disagreeable odor, but the taste is not unpleasant. *A. muscaria* contains the alkaloids muscarine, choline and atropine. Though the horsetail, *Equisetum arvense*, contg. equisetin, is poisonous to horses, humans are unaffected The poison hemlock, *Conium maculatum*, and water hemlock, *Cicuta maculata*, contain the alkaloid cicutoxine and are frequent causes of illness and death. Various other poisonous plants are described and their mode of action is discussed. C. R. FELLERS

**Proportions of glucose and fructose in corn tissues.** V. H. MORRIS. Ohio Agr. Expt. Sta., *Bull.* **497**, 53(1932).—The Burr-Leaming variety of corn was used. Glucose was detd. by oxidation with I; fructose by Nyns' method. The percentage of glucose in the free reducing sugars of the different corn tissues varied from 50 to 65. The av. was greater in the leaves than in the stems, in the lower than in the upper part of the stems, and in the grain than in the cob. The proportion of glucose in both stems and leaves decreased in the earlier stages of development and then increased somewhat. As the plants approached maturity, the proportion of glucose decreased in the leaves while that in the stem remained nearly const. until, at the end of the season, it was greater in the stems than in the leaves. The proportion of glucose in both grain and cob

increased somewhat as the plants approached maturity. The ratio fructose/glucose averaged 0.62 in the leaves, 0.76 in the stems, 0.70 in the grain and 0.79 in the cob.
C. R. FELLERS

**Form of potassium in corn tissues.** V. H. MORRIS. Ohio Agr. Expt. Sta., *51st Annual Rept. in Bull.* **616**, 35–6(1933).—Sap was expressed from green corn tissues. All the K in corn tissues was in true soln. in the cell sap. All of the K was quantitatively pptd. with Na cobaltinitrite reagent; hence it must be diffusible and ionized. The same values for K were obtained by analyses of the hot $H_2O$ ext., expressed juice and ash.
C. R. FELLERS

**Methods for the isolation of fungi from wheat roots and kernels.** H. W. MEAD. *Sci. Agr.* **13**, 304–12(1933).—The washer method of treatment for isolations from roots and seeds gave consistently good results. Saponin solns. and alc. were used in conjunction with sterile water in the washer. $H_2O_2$ permitted good growth from roots and seeds but the strength of the soln. was difficult to maintain. $Ca(OCl)_2$, when freshly made, was satisfactory for isolation purposes but the 20 min. treatment was not long enough to sterilize the seeds completely. $HgCl_2$, in water or alc., was not very satisfactory for isolation purposes but it did effect good sterilization and did not seriously affect germination. $AgNO_3$ soln. (0.01 *N*) was of no value for isolation purposes but was of value for the prepn. of sterile seedlings. C. R. FELLERS

**Gravenstein spot scald.** J. F. HOCKEY. *Sci. Agr.* **13**, 225–7(1932).—This type of injury occurred only on mature fruit contg. no starch in the pulp cells and practically no sucrose. The injury developed only when the fruit was exposed to bright light. Temp. and ventilation had no effect. The injury resembled $SO_2$ injury but no S was found on the skin. *Glutathione* was detected in the flesh by means of the nitroprusside test. This compd was particularly abundant in the affected areas. It is believed that glutathione, which is active in oxidation-reduction processes, has some connection with the injury. C. R. FELLERS

**Photosynthesis in corn.** W. E. LOOMIS AND K. H. BURNETT. *Proc. Iowa Acad. Sci.* **38**, 150(1931).—Studies on the photosynthetic efficiency of corn have indicated that: The upper leaves of the corn plant are more efficient, area for area, than the lower leaves under approx. the same light exposure. Any removal of leaves tends to reduce the yield of grain and total dry matter, but removal of leaves early in the season before leaf growth is completed or late in the season after the grain is partly formed, has less effect than removal during the early silk when the vegetative growth is complete and the production of grain not yet well started. The removal of the ear results in a stiff stalk with a well-developed root system and a heavy anthocyanin production. The total wt. of the earless stalk increases very little, while the wt. of stalk and ear on the checks is doubling Attempts to measure directly the rate of photosynthesis in normal stalks and stalks with the ears removed have given differences lower than are obtained on the basis of total dry matter produced per plant, but the data indicate that the rate of photosynthesis in corn is affected by grain production and therefore subject to indirect control by soil fertility and genetic factors. W. G. GAESSLER

**Organic matter and the life of the green plant.** NORMAN A. CLARK. *Proc. Iowa Acad. Sci.* **38**, 168–9(1931).—*Lemna major* grew and reproduced successfully in a medium composed of highly purified inorg. salts. The presence of org. matter, however, stimulated the reproduction, and the effect of org. substances has been investigated both in the presence and absence of microörganisms. No stimulation was found in the absence of microörganisms even though org. matter was introduced which improved growth under non-sterile conditions. W. G. GAESSLER

**The antioxidant of lettuce.** H. S. OLCOVICH AND H. A. MATTILL. *Proc. Iowa Acad. Sci.* **38**, 172–3(1931); cf. *C. A.* **25**, 5690.—The unsaponifiable lipides of lettuce were fractionally crystd. from a no. of org. solvents. The distribution of vitamin E was detd. by the effects on female rats on a sterility-producing ration; that of the antioxidant, by the capacity to prolong the induction period of an autoxidizable fat mixt. The antioxidant could be sepd. by extg. a petr. ether soln. with 92% MeOH. A concn of the antioxidant was secured by distn. *in vacuo*, and the compd. crystd. from the fraction distg. from 160° to 180°. It was purified by crystn. from $CHCl_3$. Formula: $C_{13}H_{14}O_5$, m. 142°. It contains 1 or more phenolic groups. W. G. GAESSLER

**The photosynthesis of carbohydrates.** E. C. C. BALY. *Sci. J. Roy. Coll. Sci.* **2**, 58–67(1932).—A review of some attempts to det. the mechanism of carbohydrate formation in plants. E. H.

**The arsenic fungi of Gosio.** CHARLES THOM AND KENNETH B. RAPER. *Science* **76**, 548–50(1932).—To det. whether, as reported by Gosio, fungi transform As compds. into gases (1) known organisms were cultured in As-contg. media, and (2) soils contg. As were examd. for As-utilizing organisms. Arsenic-gas producers were found numerous

enough to make the use of As-contg. sprays and dusts in closed spaces inadvisable, since any type of compd. may give rise to gas. L. B. HOLLANDER

**Carbon dioxide assimilation of the leaves of the rice plant, Oryza sativa L.** R. H. DASTUR AND J. J. CHINOY. *Indian J. Agr. Sci.* **2**, 431–54(1932).—The photosynthetic activity of rice leaves was measured (1) by detg. the carbohydrate content of the leaves in the morning and evening, and (2) by detg. the absorption of $CO_2$ from the air under controlled and uniform conditions. The results obtained by the 2 methods were similar and showed that photosynthetic activity rises rapidly soon after transplantation and remains fairly uniform in Aug. The activity is depressed in Sept., suddenly rises to a 2nd max. in Oct., and falls off rapidly thereafter. K. D. JACOB

**Wilt disease of Egyptian cotton caused by various species of Fusarium.** A. FIKRY. Ministry Agr. Egypt, Tech. Sci. Service, *Bull.* **119**, 106 p.(1932).—The species investigated were (I) *Fusarium orthoceras*, App. and Wr., (II) *F. vasinfectum* var. *inodoratum* Wr., (III) *F. angustum* Sherbakoff and (IV) *F. solani*, App. and Wr. Growth of I and II was obtained on Richard's soln. agar adjusted to H-ion concns. ranging from $p_H$ 4.0 to 9.0 by addns. of $H_3PO_4$, HCl and $Na_2CO_3$, max. growth being obtained at $p_H$ 7.0. Microconidia spores were formed in abundance at all H-ion concns. used; macroconidia spores only at $p_H$ 3.0–6.0; and chlamydospores usually at $p_H$ 3.0–5.0. Acid media favored the growth of large spores. The fungi were not killed when deprived of air for 12 days. To det. the effect of soil reaction on the development of wilt on cotton, samples of a clay soil having an initial $p_H$ of 8.3 were adjusted to $p_H$ values of 7.0–9.0 by addn. of HCl or NaOH and were inoculated with cultures of the organism. The greatest infection was obtained on plants grown in the original soil, those grown in soil of $p_H$ 7.0 being free from the disease. The highest incidence of mosaic was obtained with plants grown in soils of $p_H$ 7.8–8.3. Cotton plants grown in atms. contg. up to 30 parts per 10,000 of $CO_2$ did not show increased resistance to wilt attack. Study of the substances secreted by *Fusarium* showed that wilt is produced in seedlings and in old cotton plants by a toxic substance (or substances) present in the filtrates of the nutrient fluids in which the fungi have been growing. This substance is thermostable and non-volatile. The presence of nitrite in the fluid is not responsible for wilt. Filtrates of the fluids obtained after pounding up the mycelium in water also contain a wilt-producing toxin, and a substance pptd. by alc. from the filtrates either of culture solns. or of mycelial exts. is capable of causing wilt. An enzymic ext. from young hyphae affects seedlings in the same way. The cut stems of a variety of cotton which is resistant to wilt may be caused to wilt by the action of the toxin secreted by the fungi. The cotton-wilt fungi can be controlled under greenhouse conditions in infected English soil by treatment with formalin and $CuSO_4$ at the rate of 0.4 and 0.5%, resp., of the total wt. of the soil. In infected Egyptian soil both antiseptics are effective if applied at the rate of 0.4 and 1.25%, resp., no injury to the plants occurring at these concns. $HgCl_2$ has an injurious effect on seed germination and plant growth. A bibliography is included. K. D. JACOB

**Resistance of some woods to fungi.** NOBUHIKO MIGITA. *Cellulose Ind.* (Tokyo) **8**, 187–91; *Abstracts* 31–3(1932).—The resistance to *Polyporus vaporarius* Fr. of *Thujopsis dolabrata* S. and Z. (I), *Castanea crenata* S. and Z. (II), *Abies firma* S. and Z. (III) and *Fagus Sieboldi* Endl. (IV) was studied. The durability of I is considered to be due to its EtOH-BzH-sol. constituent which is probably ethereal oil and that of II to its hot-water-sol. constituent; while III and IV have no toxic matter either in their hot-water-sol. or in EtOH-BzH-sol. constituents. K. KONDA

**Growth regulators in plants.** R. SNOW. *New Phytologist* **31**, 336–54(1932).—A review of recent work. The tips of coleoptiles form a substance called "growth regulator" which accelerates elongation in the zone below by increasing the plasticity of cell walls. Root tips form a similar substance which retards growth of roots. Bacteria and fungi form similar substances. Similar substances formed in shoot tips and young inflorescences and in leaves and buds promote stem elongation and the formation of roots in cuttings, resp. Growing leaves promote cell division in the cambium. H. R. KRAYBILL

**Note on "Huang-teng," Clerodendron commersonii, Spreng.** HSIANG-CHUAN HOU. *Chinese J. Physiol.* **6**, 353–8(1932).—A variety of Huang-teng obtained from South China was identified as *Clerodendron commersonii* Spreng. It differs botanically and physiologically from *Gelsemium elegans* Benth., which is also called Huang-teng. It is a physiologically inert substance. L. A. MAYNARD

**Influencing the flower color of Primula auricula through fertilization with blood.** A. MUSSACK. *Ber. deut. botan. Ges.* **50**, 391–2(1932).—Blood seems to alter the amt. and distribution of carotene in the petals, producing a red color. The flowers normally are yellow. L. P. MILLER

**A physiological study of the lipides of Sterigmatocystis nigra.** CHARLES PONTILLON. *Rev. gén. botan.* **44**, 417–49, 465–83, 526–60(1932); **45**, 20–52(1933).—The

formation of glycerides is affected qualitatively by the reaction of the medium and quantitatively by its compn. The mycelium itself utilizes the glycerides when nutrients are deficient; this involves the formation of sterols. Sterols are used to some extent during sporulation and during autolysis. Under the most favorable conditions the I no. is low, the av. mol. wt. of the fatty acids high and the amt. of phospholipins high. A list of 354 references is appended. LAWRENCE P. MILLER

**Transformations of sugars in the banana, the formation and disappearance of starch.** H. BELVAL. *Rev. gén. botan.* **44,** 513–25(1932).—The chief sugar in the body of the leaves is sucrose. This is progressively transformed to invert sugar in the veins and petioles. In the fruit there is at first a period of starch accumulation at the expense of sol. sugars, followed by the disappearance of starch and the formation of sucrose and invert sugar as ripening occurs. The presence of dextrins could not be demonstrated. LAWRENCE P. MILLER

**A wilting substance of plants.** MAX LÜDTKE AND HIKMET ACHMED. *Biochem. Z.* **257,** 256–66(1933).—The wilting caused by parasitic fungi is attributed to one or several substances of amine nature. The natural wilting process is likewise thought to be due to such substances produced by the plant itself, and it is furthermore suggested that such amines may be present in certain soils in which the plants undergo wilting. S. MORGU

**The peculiarities of the electric charges of yeast cells.** E. A. MOLDAVSKAYA. *Biochem. Z.* **257,** 480–3(1933).—In the presence of gelatin the elec. charge on yeast cells in an elec. field undergoes a striking change. S. MORGULIS

**Lethal effect of alternating current on yeast cells.** RALPH L. TRACY, JR. *J. Bact.* **24,** 423–38(1932).—By passage of a 60-cycle a. c. through yeast-cell suspensions in grape juice at 42°, pronounced killing effects were obtained; this indicates a lethal action independent of temp. The lethal effect varied with c. d. and quantity of electricity used and may be due to the formation of temporary toxic substances like free Cl which are immediately reduced upon cessation of the current and thus disappear. Electrically treated grape juice after exposure for 30 min. was not toxic or lacking in nutrient value for yeast cells. The gases evolved from electrolysis were not toxic to yeast cells. JOHN T. MYERS

**The effect of $pCO_2$ on the nitrogen-fixation process of certain leguminous plants.** P. W. WILSON AND E. B. FRED. *J. Bact.* **25,** 54(1933).—The effect of added $CO_2$ is due to the increase in partial pressure of the $CO_2$ in the atm. and not to total $CO_2$ made available to the plant. JOHN T. MYERS

**Buffer concentration and the course of plant diseases.** F. WILLE. *Zentr. Bakt., Parasitenk. II Abt.* **87,** 301–31(1933).—Artificial changes in the buffer content of plant juices seem to affect the course of diseases, but more study is necessary. J. T. MYERS

**The organic food sources of Ankistrodesmus falcatus [Corda] Ralfs.** B. ALEEV. *Zentr. Bakt., Parasitenk. II Abt.* **87,** 340–8(1933). JOHN T. MYERS

**The effect of ethylene chlorohydrin vapors upon dormant lilac tissues.** F. E. DENNY AND LAWRENCE P. MILLER. *Contrib. Boyce Thompson Inst.* **4,** 513–28(1932); cf. *C. A.* **22,** 4582.—Lilac plants (*Syringa vulgaris* L.) were treated with ethylene chlorohydrin vapor, branches were removed for detn. of enzyme activity and chem. compn. Tests were made on bud and on tissue external to woody cylinder (twig bark and stem bark). Treatment caused increase in catalase in bud tissue and in twig and stem bark. Invertase increased in buds, slightly in twig bark and not at all in stem bark. No marked increase in amylase occurred in any type of tissue. Chem. changes included increase in moisture of buds and in sol. N and decrease in sucrose. There was increase in respiration ($CO_2$) of treated twigs. N. M. NAYLOR

**Initiation and stimulation of roots from exposure of plants to carbon monoxide gas.** P. W. ZIMMERMAN, WM. CROCKER AND A. E. HITCHCOCK. *Contrib. Boyce Thompson Inst.* **5,** 1–17(1933); cf. *C. A.* **26,** 172, 5989.—Exposure to CO induced root initiation and stimulation of preëxisting root primordia in many species of plants. Tendency to form roots occurred at the nodes, at the region of elongation of the plant or on the flower stems. Cuttings from tips of plants exposed to CO developed roots more rapidly than control cuttings. CO induced adventitious roots on woody plants. N. M. NAYLOR

**Effect of sulfur compounds in breaking the dormancy of potato tubers and in inducing changes in the enzyme activities of the treated tubers.** LAWRENCE P. MILLER. *Contrib. Boyce Thompson Inst.* **5,** 29–81(1933); cf. *C. A.* **24,** 399, 4532, 5052; **25,** 5445, 5690.—$NH_4$ dithiocarbamate, thiosemicarbazide, $H_2S$ and Et mercaptan are effective in breaking the dormancy of potato tubers. Juice from tubers treated with these chemicals showed increase over the controls, in peroxidase and catalase activity (enzyme activity cannot be increased by addn. of chemicals to potato juice), increase in $p_H$, and increase in sucrose content; these S compds. retard tyrosinase action of potato juice. Et mercaptan and $H_2S$ cause increase in respiration. Thioacetamide breaks the dor-

mancy of tubers and retards the sprouting of non-dormant potatoes. Other S-contg. compds. are less effective in breaking the dormancy of potatoes. A method for prepn. of $NH_4$ dithiocarbamate, and a modification of Willstätter's method for detn. of peroxidase, are described. N. M. NAYLOR

**Effect of chemical treatments of dormant potato tubers on the conductivity of the tissue and on the leaching of electrolytes from the tissue.** JOHN D. GUTHRIE. *Contrib. Boyce Thompson Inst.* **5**, 83–94(1933).—Ethylene chlorohydrin treatments of dormant potato tubers produced significant increases in the cond. of the tissue and increased the leaching of electrolytes from the tissue when placed in water. KCNS produced similar but smaller changes, while changes observed with thiourea were not significant. N. M. NAYLOR

**Oxygen requirements of Neurospora sitophila for formation of perithecia and growth of mycelium.** F. E. DENNY. *Contrib. Boyce Thompson Inst.* **5**, 95–102(1933).—Perithecia in *Neurospora sitophila* are formed only when mycelia of strains of opposite sex reaction meet in the presence of 1–2%, by vol., of O (room temp.). At 10°, no perithecia were formed in 30 days with any amt. of O; at 15°, they occurred in an occasional culture; at 31°, they were formed less readily than at room temp. Mycelium grew at 0.3% O and higher. $CO_2$ was not effective in preventing growth of mycelium. N. M. NAYLOR

**Eliminating the use of calcium carbonate in preparing plant tissue for analysis.** F. E. DENNY. *Contrib. Boyce Thompson Inst.* **5**, 103–14(1933).—$CaCO_3$ does not neutralize the acidity of fruit juices in alc. soln.; hydrolysis of sucrose does not occur in the presence of oxalic, citric, tartaric or malic acids on heating for 1 hr. at $p_H$ 5 and in 70% alc.; oxalic acid is effective at $p_H$ 4; some hydrolysis was found at $p_H$ 3 except under reduced time of heating. The use of $CaCO_3$ to eliminate hydrolysis of sucrose is not necessary in the analysis of most plant tissue. The behavior of inulin toward acid is similar to that of sucrose. N. M. NAYLOR

**Physiological and chemical studies of after-ripening of Rhodotypos kerrioides seeds.** FLORENCE FLEMION. *Contrib. Boyce Thompson Inst.* **5**, 143–59(1933); cf. *C. A.* **7**, 2595; **26**, 172.—Seeds of *Rhodotypos kerrioides* require an after-ripening period of 3 months at 5°. Higher germination is obtained if seeds, mixed with moist peat, are kept 1 month at 25° before the after-ripening period. Partial after-ripening causes a secondary dormancy. The most favorable storage condition is in open containers at 1°, 5° or 10°. Analyses of seeds during after-ripening show an increase in catalase, peroxidase, lipase, water-absorptive power, N sol. in 80% alc., titratable acid and sucrose. The ether-sol. fraction decreases. N. M. NAYLOR

**The droplets of sulfur in yeast cells.** G. A. NADSON AND N. A. KRASILNIKOV. *Compt. rend. acad. sci. U. R. S. S.* No. **A10**, 248–50(1932).—The oxidation of $H_2S$ with sepn. of S droplets inside yeast cells is a biochem. process. L. NASAREVICH

**Carotenoid synthesis in plants.** H. v. EULER AND E. KLUSSMANN. *Svensk Kem. Tids.* **44**, 198–204(in German)(1932).—A theoretical discussion and an inconclusive expt. A. R. ROSE

**Effect of inositol, of Bios II, and of both together in the culture medium, on the reproduction of twelve kinds of yeasts.** HELEN STANTIAL. *Trans. Roy. Soc. Can.* III, **26**, 163–4(1932); cf. *C. A.* **22**, 3897; **26**, 755–6, 1358.—The effect of inositol and Bios II added to culture media was studied for 12 kinds of yeasts: (1) *Saccharomyces pastorianus*, Hansen (No. 2339 of the Am. type culture Coll'n) and Eddy's top yeast gave large crops in salts and sugar media but were unsuited for use in the detn. of bios; (2) *Saccharomyces mandschuricus*, Saito (2333) and *Zygosaccharomyces mandschuricus*, Saito (2602) were much increased in yield by the addn. of Bios II, but no further increase was obtained by adding inositol. *Zygosaccharomyces mellis* is intermediate between this group and the next as its crop was much increased by Bios II, but the effect of adding inositol as well was small; (3) Wildiers' yeast, *Saccharomyces cerevisiae*, *Saccharomyces validus*, Hansen (2361), *Schizosaccharomyces octosporus*, Beijerinck (4206), Baker's yeast (2335), Brewer's yeast (2331), and Eddy's bottom yeast all gave large yields in media contg. both inositol and Bios II, as compared with yields on media contg. only 1 or neither of these constituents. J. W. SHIPLEY

**Biology of the potato. XVI. Study on the colloid structure of potato tubers. Differences between vital and degenerating tubers.** H. BECHHOLD, F. ERBE, K. SILBEREISEN AND F. BACK. *Arb. biol. Reichs. Land-Forstw. Berlin-Dahlem* **20**, 111–39(1933).—A no. of attempts are described to find clear differences between tubers still living and those in the early stages of breakdown. The retention of water under pressures of 0.1–3.5 mm. Hg, and the uptake of water on immersion, were higher in the living tubers. Neither the viscosity of the press juice, elec. cond. or x-ray diagram of the tissue, deformability of slices under compression, nor the ease of diffusion of dyes into the tissue showed any difference between the various states of the tubers. However,

introduction of a strip of Cu foil, 1 cm. wide, into the tubers causes deep and extensive staining of the tissue when still vital, but has very little effect on tubers beginning breakdown, and is proposed as a test. Detns. of "vitality" by plant studies were strictly parallel to the results of the Cu test in 327 tubers from 10 sources. Healthy potato tissue reduces methylene blue, but not safranine. K. V. THIMANN

**Biochemical studies on the "maturity" of sugar cane.** SHIGERU KOMATSU, SHINSAKU OZAWA AND YASUO MAKINO. *Mem. Coll. Sci. Kyoto Imp. Univ. Ser. A*, **16**, No. 1, 125 pp.(1933)(reprint).—Report of 3 years' researches on "Hayaue" canes in Formosa. The water content of the leaves increased to a max. of 76% in June, and then fell. The chlorophyll content reached a max. of 0.27 mg. per sq. cm. leaf area in May–June and a min. of 0.092 in November, and was in general higher in canes grown in sandy soil than in those grown in clay or water-logged soils. The increase in length and wt. of each internode was detd. throughout the year, and found to reach a const. value in each case, ranging from 3.7 g. per cm. length, for the youngest internodes, to 10.2 g. per cm. for the oldest. The $p_H$ of the sap varied from 4.7 to 5.6, the acidity being higher in the younger portions of the stalk, probably on account of the oxidation of sugars to org. acids. The reducing and non-reducing sugar contents varied inversely. Thus, when the sugar content changed from 4.5 to 0.7 g. per 100 cc. juice, the non-reducing sugar ch from 0.2 to 19.2 g., the period intervening being 3–4 months in each case. Analy the whole stalk gave similar results The development of roots and shoots on small cuttings caused the reducing and non-reducing sugars to fall to 66 and 31%, resp., of their initial values. The accumulation of sucrose in the cane during the cool weather is thus partly a storage phenomenon, particularly since, when completely defoliated, the cane continues to grow at the expense of the sugar. On the other hand, sucrose is also accumulated during vigorous growth, though to a smaller extent, and furthermore, the decrease of sucrose during flowering is only slight. The accumulation of sucrose thus depends on a balance between synthetic and catabolic processes. On this account the ripening process and the fixation of solar energy have been treated mathematically; the rate of utilization of energy for photosynthesis, $dP/dt$, is taken as $kTIC$, where $T$ is temp., $I$ the light intensity and $C$ the quantity of chlorophyll in the leaf. The value of $k$ was detd. from measurements of the area of the leaf-crown and the illumination, and is $1.6.10^{-3}$. The ratio of the rate of fiber production to the rate of total energy fixation is of the order of 0.5, but may exceed 1 during May, indicating conversion of sucrose into fiber. Calcn. of the total energy falling on the plant shows that up to 3% of it may be utilized in photosynthesis. K. V. THIMANN

Plant synthesis of carbohydrates and polysaccharides (HIBBERT) 10.

## E—NUTRITION

PHILIP B. HAWK

**The content of total carbon dioxide of the blood in relation to the acidic or basic nature of the foods.** A. ROSSI. *Chim. ind. agr. biol.* **8**, 407(1932)(abstr.); cf. *C. A.* **26**, 5620.—No relation was found between the $CO_2$ content of the blood (I) and the $p_H$ of urine (II), or between I and the nature of the foods. If, instead of normal foods, $NaHCO_3$ is supplied, there is an increase of II to 8.4, but I does not vary. If $NH_4Cl$ is given, there is a decrease of II to 4.4, and a great decrease of I. G. A. BRAVO

**Ammonium salts and nitrogen metabolism.** U. LOMBROSO. *Chim. ind. agr. biol.* **8**, 410–11(1932)(abstr.).—Expts. of various kinds show that $NH_4$ salts are not utilized in N metabolism. G. A. BRAVO

**Vitamin 1-D deficiency of the liver of higher animals.** SIGNE SCHMIDT-NIELSEN AND SIGVAL SCHMIDT-NIELSEN. *Kgl. Norske Videnskab. Selskab. Forh.* **5**, 108–9(1932); cf. *C. A.* **26**, 3544.—The livers of rats which had been overfed on vitamin 1-D were fed to rachitic rats. There was no indication of vitamin 1-D storage in the liver. RACHEL BROWN

**Ergosterol, irradiated ergosterol and alcoholic fermentation.** F. PIRRONE. *Ann. chim. applicata* **22**, 731–7(1932).—As a possible method of evaluating the vitamin potency of activated ergosterol, the rate of fermentation of a glucose soln. by ergosterol and activated ergosterol has been detd. The greatest activity for the non-activated material was obtained with 0.001 g. per 100 cc. of sugar soln. and was measured in terms of cc. $CO_2$ evolved (107.22 cc.). With irradiated ergosterol (exposed for 20 min. at 25 cm. from the ultra-violet lamp) a max. evolution of 107.81 cc. $CO_2$ was evolved with 0.001 g./100 cc. A. W. CONTIERI

**Accessory food factors. The fat-soluble vitamin requirements of cattle and pigs during growth, with remarks on some other questions as to the vitamin problem in cattle and pig feeding.** HAAKON ISAACHSEN. *J. Agr. Sci.* **22**, 460–84(1932); cf. *C. A.* **26**,

5126.—With calves, on rations of practically equal starch equiv., a ration with a low proportion of whole milk to skimmed milk supplemented with peanut oil (free from fat-sol. vitamin) was as favorable as a ration with a high proportion of whole to skimmed milk, without the supplement. Use of cod-liver oil in a ration with a low proportion of whole to skimmed milk did not show superiority to a ration with a high proportion of whole to skimmed milk. Liberal quantities of skimmed milk supplemented with an amt. of tapioca flour (no vitamin A) equiv. to the fat of the whole milk were as good as a whole-milk ration. Spring and summer calves did not develop better than fall and winter calves, although the nursing milk of the former was richer in vitamins A and D. In some periods, herring meal, with its appreciable amt. of antirachitic vitamin, appeared to maintain the Ca and P balance in milking cows on dry feed better than fish meal with almost no vitamin content, or peanut cake. Expts. with pigs showed that cereals, including yellow corn, contain sufficient fat-sol. vitamins to maintain normal growth; but the vitamin D content may be insufficient to protect against rickets. Pigs are more likely to suffer from disordered mineral metabolism resulting from deficiency of minerals in the feeds, particularly Ca, P and Na, or from an incorrect Ca/P ratio than they are from feeds generally considered poor in fat-sol. vitamins. Good herring meal, with its vitamin D content, is one of the best feeds for protecting pigs against rickets. Cod-liver oil was not successfully used to make unthrifty piglings vigorous. Rations rich in vitamin B, fed to lactating sows with scanty flow, did not improve the piglings. Irradiation with ultra-violet light of sows in the last 6 weeks of gestation and of sows with litters did not improve the growth or condition of the pigs. P. R. DAWSON

**The mechanism of cellulose digestion in the ruminant organism. III. The action of cellulose-splitting bacteria on the fiber of certain typical feeding stuffs.** H. E. WOODMAN AND J. STEWART. *J. Agr. Sci.* **22**, 527–47(1932); cf. *C. A.* **24**, 137.—Quant. investigations are reported on the action of thermophilic cellulose-splitting bacteria on the fiber of a no. of typical feeding stuffs. The fermentation coeffs. were higher than the corresponding fiber-digestion coeffs. as detd. in animal trials, probably because the former were detd. on fiber after its sepn., by chem. means, from other constituents, and this rendered it more readily accessible to the action of the bacteria. The fermentation coeffs. of the fiber in both sugar-beet pulp and young leafy grass indicate the non-lignified character of the fiber in these foods. There is evidence that in other foods the formation of a small amt. of lignocellulose may be responsible for a distinct lowering of digestibility, caused not necessarily by the amt. of lignocellulose but also by the manner of its deposition within the cell walls. Detn. of the fermentation coeff. of fiber after its chem. isolation from a feeding stuff yields useful data concerning the partition of the fiber into cellulose and lignocellulose. Application of the method to study the changes in the character of the fiber during the growth of perennial rye grass demonstrates that the process whereby green crops become lignified and of reduced digestibility is assocd. with the production of relatively small amts. of lignocellulose, a conclusion in harmony with results of feeding trials and the detn. of MeO groups in the fiber of grass at different stages. Here again the digestibility of the fiber is not merely influenced by the amt. of lignocellulose but primarily by the intimacy of the assocn. of the lignocellulose with the cellulose in the cell walls. Expts. are also described on the fermenting capacity of the culture of cellulose-splitting bacteria at different stages of its history; the requirements of the microörganism for org. N; the isolation of cultures of the bacteria from manure, and from the contents of the rumen and abomasum of sheep. The characters of the fiber in sheep feces on different rations was also investigated by the fermentation method. P. R. DAWSON

**Mineral balance studies on poultry.** ROBERT H. COMMON. *J. Agr. Sci.* **22**, 577–94(1932).—Pullets displayed a diminution of the Ca and P in their droppings over a period of about 2–3 weeks before laying, and a corresponding increasing retention of these elements. Egg laying was correlated with a relatively heavy voiding of P in the droppings, involving a temporary neg. P balance. Results obtained by other workers are thus confirmed and amplified. P. R. DAWSON

**The value of oats in the nutrition of swine.** H. E. WOODMAN, R. E. EVANS AND A. W. MENZIES KITCHIN. *J. Agr. Sci.* **22**, 657–69(1932).—The results of feeding expts. showed that the digestibility of oats by pigs is increased with fineness of grinding. The digestion coeff. of the org. matter of the grain was low (56.7%) with crushed oats; it increased to 67.5% with farm-ground material; and it reached 75.9% when the grain, both husk and kernel, was ground to a fine meal. Even when most finely ground this cereal is somewhat inferior in digestibility to barley meal as food for pigs. In farm-feeding trials neither the partial replacement of barley meal (lb. for lb.) nor the total replacement of middlings by farm-ground oats had any significant effect on the rate of live-wt. increase or economy of food conversion. The oil from the oats had no detrimental effect on carcass quality. P. R. DAWSON

**The value of degermed maize meal [cooked] in the nutrition of swine.** H. E. WOODMAN AND R. E. EVANS. *J. Agr. Sci.* **22,** 670–5(1932).—Degermed corn meal (cooked) was equal, in respect to digestibility, to such highly digestible foods as tapioca flour and flaked corn, and significantly superior to whole corn meal and barley meal. Its low oil content is also an advantage. P. R. DAWSON

**The relation of calcium and phosphorus to growth and rachitic leg weakness in chickens.** RAYMOND T. PARKHURST AND MARY R. MCMURRAY. *J. Agr. Sci.* **22,** 874–82(1932).—Both a ration contg. but 0.26% Ca and having a Ca:P ratio of 0.44:1 (no-limestone ration), and a ration in which 5% of corn meal had been replaced by 5% of ground limestone to give a Ca content of 3% and a Ca:P ratio of 4:1 (limestone ration), led to retarded growth and poor bone development when fed to chicks. Both rations contained adequate vitamin D for the needs of birds on a normal diet. When given access to grass runs, the chicks on the no-limestone ration showed marked improvement, while those on the limestone ration were not appreciably affected. Previous results, indicating that ground limestone may have a depressing effect on growth, are thus confirmed. P. R. DAWSON

**Thermal products from vitamin $D_2$ and their hydrogenation derivatives.** P. BUSSE. *Z. physiol. Chem.* **214,** 211–22(1933).—The crude irradiation products of ergosterol lose their antirachitic activity when heated but retain their toxicity; renewed irradiation then partly restores their antirachitic activity. Vitamin $D_2$ when subjected to this treatment loses both antirachitic activity and toxicity and cannot be reactivated. The peculiar behavior of the crude irradiation products is not a property of vitamin $D_2$ but is probably due to lumisterol, tachysterol and toxisterol. The isolation and purification of the thermal products of vitamin $D_2$ and their hydrogenation products are described. The vitamin was completely isomerized, by heating 4 hrs. at 180–90°, into a mol. complex, m. 123°, consisting of 50% *pyrocalciferol* (I) m. 94–5°, and 50% isopyrovitamin (II), m. 112–15°. The sepn. was effected by treatment with $Ac_2O$, which converts II into a difficultly sol. *acetate*, m. 113–15°, $[\alpha]_D^{20}$ 333°. Hydrogenation of II by Na-EtOH gave *dihydroisopyrovitamin*, m. 129–30°, $[\alpha]_D^{21}$ 11.85° (*acetate* m. 145–6°, $[\alpha]_D^{18}$ 30.2°). Further hydrogenation of the acetate by Pt-$H_2$ and sapon. of the product gave *hexahydroisopyrovitamin*, sintering 68–80° with no sharp m. p., $[\alpha]_D^{20}$ −6.95° (*4-methyl-3,5-dinitrobenzoate* m. 164–5°, $[\alpha]_D^{20}$ 1.37°). I was purified through its *m-dinitrobenzoate*, m. 170–1°, $[\alpha]_D^{21}$ 195°. Hydrogenation by Na-EtOH yielded *dihydropyrocalciferol*, m. 121–2°, $[\alpha]_D^{18}$ 70.3° (*acetate* (III) m. 131–3°, $[\alpha]_D^{17}$ 44.7°). Heating the dihydro deriv to 190° with NaOEt in EtOH rearranged it to *epidihydropyrocalciferol*, m. 138–9°, $[\alpha]_D^{20}$ 54.3° (*acetate* (IV) m. 98–9°, $[\alpha]_D^{19}$ 35–6°). Further hydrogenation of III by Pt-$H_2$ gave *hexahydropyrocalciferol acetate*, m. 139–40°, $[\alpha]_D^{19}$ 26.1° (sapond. sterol m. 130–1°, $[\alpha]_D^{18}$ 34.35°). Similar hydrogenation of IV gave *hexahydroepipyrocalciferol*, m. 137°, $[\alpha]_D^{18}$ 30.15°, purified through its *m-dinitrobenzoate*, m. 197–8°, $[\alpha]_D^{18}$ 20.9°. None of the derived sterols was antirachitic or toxic. A. W. DOX

**The nutritive value of marine products. V. The vitamin A content of ling cod-liver oil. Preliminary note.** B. E. BAILEY. *Contrib. Can. Biol. Fisheries* **7,** 405–12 (1933).—The liver oil of the Pacific Coast ling cod has been examined for vitamin A by both biol. and colorimetric methods. The oil is a very rich source of vitamin A, the least potent sample contg. 20,000 rat units per g. F. L. DUNLAP

**Food value of milk.** EDNA L. FERRY, JULIA P. OUTHOUSE AND BEATRICE HALL. Conn. Agr. Expt. Sta., *Bull.* **340,** 657–94(1932); cf. *C. A.* **14,** 784.—A comprehensive treatise on the compn. and nutritive value of milk with a review of investigations. C. R. FELLERS

**Exposure of ground yellow corn to air did not destroy vitamin A.** ROY E. ROBERTS. Ind. (Purdue) Agr. Expt. Sta., *Rept. Director for Year Ending June 30, 1931,* 46. Yellow corn was freshly ground and assayed for vitamin A. Other shelled corn from the same lot was spread in a thin layer on the floor in a warm room for 6 months and then assayed. There was no measurable difference in the vitamin A content of the 2 lots of corn. C. R. FELLERS

**Nutritive value of eggs as affected by the feeding of cod-liver oil to hens.** S. E. ERIKSON, R. E. BOYDEN, W. M. INSKO, JR., AND J. HOLMES MARTIN. Ky. Agr. Expt. Sta., *44th Annual Rept.* 41–3(1931).—Practically no correlation exists between the $p_H$ of the yolk and that of the white in fresh eggs; there is a fair correlation in storage eggs. Total P of the ash of yolks of fresh eggs shows lower values in birds in sunlight receiving cod-liver oil than in those receiving none; the reverse is true in birds confined without sunlight. The values for Ca, acid-sol. org. and inorg. P do not vary in the same way. The storage of eggs causes the $p_H$ of both whites and yolks to increase. In general, the $p_H$ of fresh eggs laid by birds fed cod-liver oil is lower than that in eggs from birds not receiving the oil. C. R. FELLERS

**Influence of antirachitic substances on growth of poultry.** W. FRANKLIN DOVE.

Maine Agr. Expt. Sta., *Bull.* **360**, 172–5(1931).—Dried eggs may be held in storage for several months with no loss of vitamin D in the yolks. The chick is better than the rat for vitamin D research because the chick is much more sensitive to vitamin D deficiencies. C. R. FELLERS

**Value of dried skim milk for fattening poultry.** E. M. FUNK, H. L. KEMPSTER AND C. G. BRYAN. Mo. Agr. Expt. Sta., *Bull.* **309**, 3–23(1932).—Very satisfactory wt. gains were obtained with broilers, roasters and hens. The lowest dressing loss was obtained when the birds were fattened with a ration contg. 5% dried buttermilk. Condensed buttermilk produced the highest-quality birds. The most satisfactory wt. gains were obtained when dried buttermilk was fed at the 10% level. More feed was consumed by birds receiving condensed or dried buttermilk than those on liquid buttermilk. C. R. FELLERS

**Increasing the vitamin D content of milk. II. Effect of feeding cows a cod-liver oil concentrate [Vitex].** W. W. KRAUSS, R. M. BETHKE AND WILLARD WILDER. Ohio Agr. Expt. Sta., *Bimonthly Bull.* **18**, 15-19(1933); cf. *C. A.* **26**, 4630.—On a basal ration low in vitamin D the milk contained 2.76 rat units per quart; when 60,000 rat units of vitamin D as Vitex were fed, the milk contained 30.35 Steenbock rat units of vitamin D per quart, an 11-fold increase. This potency, however, is far below the 160 rat units per quart recommended for milk to be used as an antirachitic agent for infants, and the cost of Vitex is prohibitive for this purpose. C. R. FELLERS

**Fish-meal supplements for chicks. I. Comparative rate of growth-to-eight-weeks on rations supplemented with pilchard, salmon, halibut, dried skim milk or with salmon meal and dried skim milk.** V. S. ASMUNDSON AND JACOB BIELY. *Sci. Agr.* **13**, 236–48(1932).—There was no significant difference in the av. wt. of chicks at 8 weeks when fed rations supplemented with salmon meal, pilchard meal or dried skim milk to supply 10% of protein. Halibut meal gave slightly less consistent gains than salmon meal or dried skim milk. At protein levels higher than 7.5% chicks fed salmon meal and dry skin milk gave better gains than when fed salmon meal alone. Increasing the amt. of protein supplied by salmon from 7.5 to 10% did not increase rate of growth, but a similar increase in the rations where both salmon meal and milk were fed increased the wt. attained at 8 weeks. C. R. FELLERS

**Hog-feeding experiments.** F. B HEADLEY. Nev. Agr. Expt. Sta., *Bull.* **125**, 3–30 (1932).—Growing pigs are unable to assimilate effectively feed contg. a large amt. of crude fiber. To make the most rapid gains, the pigs must be fed a concd. ration contg. less than 5% crude fiber. The no of days necessary to attain a 200 lb. marketing wt. was increased by 5.4 for each increase of 1% in crude fiber in the ration. Pigs on alfalfa hay required 259, 340 and 413 lb. of grain per cwt. gain on 2%, 4% and self-fed ration, resp On alfalfa pasture they required 262, 336 and 410 lb. of grain per cwt. gain when fed 2%, 4% and self-fed rations. The addn of tankage to a ration contg. 2% grain and alfalfa hay with a liberal allowance of dry skim milk was of no advantage. C. R. F.

**Feeding value of dried apple pomace for dairy cows.** J. C. KNOTT, R. E. HODGSON AND E. V. ELLINGTON. Wash. Agr. Expt. Sta., *Bull.* **270**, 3–17(1932); cf. *C. A.* **26**, 4361.—Dried apple pomace possessed a total digestible nutrient content of 71.58%. The coeffs. of apparent digestibility for the various constituents were high with the exception of the protein. The digestibility of the dry matter was 72%. Dried apple pomace is only slightly less valuable as an animal feed than sugar-beet pulp. For feeding, the dry pomace should be soaked in 2.5 times its wt. of water for 10–12 hrs. C. R. FELLERS

**Effect of low-calcium and low-phosphorus rations on growing dairy heifers.** H. O. HENDERSON AND C. E. WEAKLEY, JR West Va. Agr. Expt. Sta., *Bull.* **244**, 16–17 (1931); cf. *C. A.* **25**, 4583.—Low-Ca and -P rations caused depraved appetites such as bone or wood chewing. Low P in the ration greatly reduced the inorg. P in the blood. However, there was no correlation between the amt. of Ca in the diet and that in the blood. The fluctuations in inorg. P in the blood from day to day are very great. Blood Ca varies between much narrower limits than blood P. The blood P appears to decrease with the age of the animal. C. R. FELLERS

**Photographic recording of line tests for vitamin D.** A. L. BACHARACH, E. ALLCHORNE, V. HAZLEY AND S G. STEVENSON. *Ind. Eng. Chem., Anal. Ed.* **5**, 12–14(1933); cf. *C. A.* **26**, 3015.—Full details are given for photographing, developing and printing the results of line tests for vitamin D. S. B. FOSTER

**Availability of vitamins in plant tissues.** JESSIE E. RICHARDSON AND HELEN L. MAYFIELD. *Science* **76**, 498–500(1932).—Storage of carrots and potatoes until spring resulted in increased vitamin (A, B complex, $B_1$, C) potencies in the raw vegetables, and a loss of potency when cooked as compared with exptl. results obtained in the fall. These differences are ascribed to an increased availability of the vitamins due to changes n the organization of the plant cell under the given conditions. S. B. FOSTER

**Action of sodium hypochlorite on the nutritive quality of skim-milk powder prepared in winter by evaporation on cylinders heated by steam to 100–103°.** P. Mazé and R. Anxionnaz. *Compt. rend. soc. biol.* **112**, 245–7(1933); cf. *C. A.* **26**, 2220.—Rats were fed as previously described, except that the milk was not irradiated, but, after being dissolved, was treated with a little NaOCl and heated. This made the added KI and NaF more readily assimilated and the rats were not sterile as they were when the NaOCl was omitted. L. E. Gilson

**Stability of vitamin A in cod-liver oil emulsions.** H. N. Griffiths. *Analyst* **58**, 65–8(1933).—Some 5 different types of emulsions were studied over a period of 15 months. Conclusion: The agents employed in making com. emulsions do not diminish the stability of vitamin A. W. T. H.

**Nutritive significance of mineral salts.** Arthur H. Smith. *Dental Cosmos* **75**, 147–53(1933).—A review. Joseph S. Hepburn

**The treatment of pyuria with soybean meal.** A. Mader. *Monatsscher. Kinderheilk.* **54**, 212–27(1932); cf. *C. A.* **26**, 2767.—In discussing the therapeutic value of soybean meal M. presents data on its chem. compn., obtained by himself and others. It is an adequate food from the point of view of amino acid content. It is high in K, Na, Ca and Mg, and the excess of cations is 37.89 mg. equivs. as compared with 2.25 and 1.69 for human and cow milk. Its value as an alkalinizing agent is shown by its ability to maintain the reaction of the urine in the vicinity of $p_H$ 8.4. E. M. Humphreys

**Variations in the reaction and salt content of the urine during fasting.** Ragnar Nicolaysen. *Norsk Mag. Laegevidenskap.* **93**, 766–73(1932).—If a person is fasting during the "alk. tide" in the urine, there is an increase in the concn. of Cl in the 1st hrs. after awaking, and also at the same time an increase in the concn. of Na and K. Independently of these variations, the concns. of Ca and Mg decrease to a min., where they remain const. H. C. M. Ingeberg

**Variations in calcium content of human blood during fasting.** Ragmar Nicolaysen. *Norsk Mag. Laegevidenskap.* **93**, 774–6(1932).—Variations up to 2 mg. % in the Ca content of the blood occurred in the course of a day in a fasting individual, and max. variations of 2.5–3 mg. % (from 8.5 to 11.5 mg. %) in the same individual from one day to another. H. C. M. Ingeberg

**The influence of raw milk on teeth and growth.** E. Sprawson. *Scottish J. Agr.* **16**, 23–31(1933).—Children brought up on raw milk from their earliest years are markedly free from dental caries, whereas the reverse may be true with those receiving pasteurized or sterilized milk. Bibliography. K. D. Jacob

**The need of the infant for milk and the minimum quantity necessary for growth.** L. Ribadeau-Dumas. *Lait* **12**, 754–60(1932).—The min. quantity of milk for satisfactory growth and acceptance by the infant is about $^1/_{10}$ of the ration. It was not possible to show that milk contained a certain substance necessary for growth, but all the constituents of milk were considered contributing factors. A. H. Johnson

**Antirachitic activation of milk by direct irradiation with ultra-violet rays.** G. C. Supplee. *Am. J. Pub. Health* **23**, 225–9(1933). J. A. Kennedy

**Production of antirachitic milk by the feeding of dairy cattle.** J. G. Hardenbergh and L. T. Wilson. *Am. J. Pub. Health* **23**, 230–6(1933). J. A. Kennedy

**Glucolytic enzyme in the liver of animals with vitamin B deficiency. Effect of iodine in B-avitaminosis.** Tsune Ariyama. *J. Agr. Chem. Soc. Japan.* **8**, 756–64 (1932).—The livers of white rats fed synthetic diets without vitamin B contained 10% less glyoxalase than the livers of normal rats, but the same amt. as the livers of starved rats. Glycolase in the liver also decreased in B-avitaminosis and in starvation. No relation between B-avitaminosis and quantity of glyoxalase could be found. When thyroxine was given *per os*, and NaI by hypodermic injection, the antineuritic symptoms on a vitamin-B-free diet were checked to a certain extent. Y. Kihara

**Vitamin studies. V. Chemical methods of vitamin determination. 1. The Bezssonoff reaction.** F. V. v. Hahn and M. Wieben. *Z. Untersuch. Lebensm.* **63**, 481–95(1932); cf. *C. A.* **26**, 503.—Twenty-three fruits, 52 fresh and 18 canned vegetables, and 20 orange juices were examd. experimentally for their antiscorbutic potency and simultaneously tested by the Bezssonoff reaction. Conclusion: The B. reaction gave no indication as to the vitamin C content of the foodstuffs. S. Laufer

**Vitamin D content of the fat of sea perch, porpoise and seal.** S. N. Matzko and D. A. Vital. *Z. Untersuch. Lebensm.* **63**, 495–8(1932).—These 3 fats contained 100–150 units per g., less than 50 units and a negligible amt., resp. S. Laufer

**Vitamin C and hexuronic acid.** T. Moore and S. N. Ray. *Nature* **130**, 997–8 (1932).—After being stained for 15 min. with 0.4% $AgNO_3$, suprarenal glands from normal guinea pigs were deeply blackened; glands from scorbutic guinea pigs were completely unaffected. This adds evidence to the close relationship between vitamin C and hexuronic acid, since the latter reduces $AgNO_3$. Suprarenals of rats fed on diets deficient

in vitamin C give pos. $AgNO_3$ reactions. This agrees with the view that rats can synthesize vitamin C. MARY E. LEAR

**"Hexuronic acid" [ascorbic acid] as the antiscorbutic factor.** A. SZENT-GYÖRGYI AND W. N. HAWORTH. *Nature* **131**, 24(1933).—Ascorbic acid is suggested as the name for the cryst. substance $C_6H_8O_6$, previously described (cf. *C. A.* **26**, 5128). The material described as "hexuronic acid" contains 1 mol. less $H_2O$ than is required for a hexuronic acid. MARY E. LEAR

**Methylnornarcotine, glucuronic acid and vitamin C.** W. J. DANN. *Nature* **131**, 24–5(1933).—An attempt to confirm the hypothesis of Rygh (*C. A.* **27**, 122) that the antiscorbutic activity of hexuronic acid is due to contamination by methylnornarcotine was unsuccessful. All animals fed on a scurvy-producing diet, whether supplemented by methylnornarcotine, glucuronolactone or both, showed the same signs of severe scurvy as the neg. controls. MARY E. LEAR

**Experimental study of the antirachitic factor in human and animal milks.** I. A. SABRI AND M. M. FIKRY. *Arch. Disease Childhood* **7**, 239–48(1932).—Human milk, cow milk and buffalo milk (commonly consumed in Egypt) contain a provitamin, which upon irradiation is converted into vitamin D, the quantity formed being sufficient to prevent the development of rickets. Human and cow milk have approx. the same content of vitamin D. E. R. MAIN

**Diet, nutrition and infection.** ALFRED F. HESS. *New Engl. J. Med.* **207**, 637–43 (1932).—The susceptibility of infants to respiratory infections is apparently not assocd. with a lack of vitamin D. A local susceptibility without loss of appreciable systemic immunity may be induced by a lack of vitamin C. The milk content of the diet of the av. infant furnishes an adequate supply of vitamin A. E. R. MAIN

**The uric acid in the blood and its elimination in the urine in relation to diet.** W. MORACZEWSKI, ST. GRZYCKI, H. JANKOWSKI AND R. SLIWINSKI. *J. physiol. path. gén.* **30**, 659–65(1932).—See *C. A.* **26**, 5127. L. A. MAYNARD

**The surface potentials of unimolecular films of ergosterol. The photochemical formation of vitamin D.** RUSSEL J. FOSBINDER. *Proc. Roy. Soc.* (London) **A139**, 93–104(1933).—Evidence is presented to show that ergosterol can be converted into vitamin D by ultra-violet radiation. The app. used for the detn. of the surface potential of ergosterol was a quartz tray, graduated glass scale, Swan type electrometer, a Po-coated Pt air electrode and calomel cell. The ergosterol was placed upon citric acid-NaOH buffers of $p_H$ 6.4. In the presence of the radiation an expansion of the film took place, indicating that the secondary alc. group suffers a change. Surface potential changes are plotted against time of radiation, and surface tension against area; the curves indicate the formation of vitamin D. H. E. MESSMORE

**Hypervitaminosis D. Relations between irradiated ergosterol and water-soluble vitamins.** PIETRO COCCHERI AND GIOACCHINO ROSSI. *Biochim. terap. sper.* **38**, 408–20 (1932); cf. *C. A.* **26**, 2223.—The feeding of 10,000 prophylactic rat units of irradiated ergosterol during 2 months produces in young rats and rabbits a non-fatal syndrome which is opposed in its symptoms to exptl. rickets. The characteristics are reduction in growth, a limited hypercalcification of the bone proliferation, hyperphosphatemia and moderate hypercalcemia. The purity of the prepn. used accounts for the absence of really toxic symptoms. Simultaneous doses of vitamins B and C are effective in the prevention of hypervitaminosis D. A. E. MEYER

**Carotenemia associated with the ingestion of pumpkin. Report of a case.** A. C. CURTIS AND E. E. KLEINSCHMIDT. *Ann. Internal Med.* **6**, 751–3(1932).—The blood carotene content was 1.65 mg. % at its height. JOHN T. MYERS

**The breaking strength of healing fractured fibulae of rats. IV. High-carbohydrate diet.** R. M. MCKEOWN, M. K. LINDSAY, S. C. HARVEY AND R. W. LUMSDEN. *Arch. Surg.* **25**, 722–48(1932); cf. *C. A.* **26**, 5995.—The body wt. of both control and fractured rats was less than on a normal or a high-fat diet. The time of healing was normal but the strength of the callus was less. It is possible that increased absorption of carbohydrates is followed by decreased phosphate in the blood, which would permit an increased excretion of Ca because of lack of phosphate to combine with it, or the amt. or activity of phosphatase may be reduced. **V. Low-calcium diet.** R. M. MCKEOWN, S. C. HARVEY AND R. W. LUMSDEN. *Ibid* 1011–34.—P is more important to the strength of healing fractures than is Ca. JOHN T. MYERS

**Carotenoids and vitamin A in animal and plant tissues.** H. v. EULER, ULLA GARD AND H. HELLSTRÖM. *Svensk Kem. Tids.* **44**, 191–8(in German)(1932).—Spectroscopic bands are recorded for prepns. from procreative tissues of fish, mammals and plants. Carotene is demonstrated in all of these, in very minute quantities, however, in some specimens, *e. g.*, lily stamen, pike milt. This universal presence suggests that carotene is an essential growth factor. Other tissues, sites of cell proliferation, also contain this pigment, but bone marrow, pos. for vitamin A, gave no carotene band. Xanthophyll

and zeaxanthin bands occurred sporadically, and chlorophyll is present in fresh-water fish roe. A. R. ROSE

**Carotene and vitamin A.** H. v. EULER AND E. KLUSSMAN. *Svensk Kem. Tids.* **44,** 223–4(1932)(in German).—Carotene is changed to vitamin A by liver tissue in saline suspension. A. R. ROSE

**The effect of irradiated ergosterol upon the absorption of calcium.** N. B. TAYLOR AND C. B. WELD. *Trans. Roy. Soc. Can.* V, **26,** 9–12(1932); cf. *C. A.* **26,** 4362.—A series of 3-month-old pups was put on an adequate diet of dog biscuit and meat and Ca excretion was followed for a period of 28 days. At the end of this time irradiated ergosterol (0.12 cc. per kg. 250D) was administered for a period of 31 days, and the rate of excretion of the Ca was nearly doubled. As the dose of ergosterol was increased to 2.1 cc. per kg. there was a further rise in the excretion of Ca, while on withdrawal of ergosterol the amt. of Ca excreted dropped. Conclusion: No evidence was found that irradiated ergosterol increases Ca absorption, but on the contrary excretion is increased even with small doses. LOUIS J. SOFFER

**The effect of small [therapeutic] doses of irradiated ergosterol upon the serum calcium.** N. B. TAYLOR AND C. B. WELD. *Trans. Roy. Soc. Can.* V, **26,** 13–16(1932); cf. *C. A.* **26,** 4362.—The initial effect following either the oral or subcutaneous administration of irradiated ergosterol was a temporary fall in serum Ca. This was then followed by a rise. In one parathyroidectomized animal in which the serum Ca was below normal, subcutaneous administration of 1 dose of ergosterol was followed by a further drop in Ca. Doses of 1.0 cc. of 10,000 X of irradiated ergosterol were used for oral administration while 2 0 cc. of 10,000 X were employed subcutaneously. LOUIS J. SOFFER

**The administration of irradiated ergosterol to dogs with biliary fistulas.** N. B TAYLOR, C. B. WELD AND J. F. SYKES. *Trans. Roy. Soc. Can.* V, **26,** 29–31(1932).—Irradiated ergosterol (0.4 cc 10,000 X per kg.), administered orally to dogs in which the bile drained to the exterior through a tube connected to the common bile duct, did not cause hypercalcemia or any other sign of overdosage. This inability of the irradiated ergosterol to raise the serum Ca is attributed to failure of the sterol to be absorbed from the bowel in the absence of bile. When irradiated ergosterol was injected intravenously some of the dogs with biliary fistulas showed a rise in the serum Ca. Bile collected from the animals which received the ergosterol by mouth showed no definite antirachitic effect, while bile obtained from animals treated intravenously was antirachitic. The authors suggest that ergosterol is excreted in the bile and as long as the bile can enter the duodenum, any ergosterol removed from the blood is reabsorbed on reaching the intestine and continues to exert the prolonged effect which even a single dose is known to exert. The varying degrees of susceptibility to this material of different species and even of members of the same species may be due to the variability of absorption When about 40 cc. of bile was fed to bile-fistula dogs, the irradiated ergosterol produced its usual hypercalcemic effect. LOUIS J. SOFFER

**The effect of irradiated ergosterol on calcium and phosphorus retention in children.** C. B. WELD AND J. F. SYKES. *Trans. Roy. Soc. Can.* V, **26,** 81 8(1932).—Ca and P balances were detd. weekly for 10 weeks on 6 children, aged 8–13 years, who were kept on a const. diet during that time. During the 1st 5 weeks and for a month preceding this, none of the children was given any vitamin D, while 4 of the 6 were given 50 Steenbock units daily during the last 5 weeks. The diet was a mixed diet of about 2100 calories, contg. about 0.823 g. Ca and 1.18 g. P daily. The small amts. of vitamin D given did not affect Ca and P in normal children on a diet moderately low in Ca but otherwise adequate. LOUIS J. SOFFER

**The effect of acid feeding on the composition of bone.** A. L. CHUTE AND LAWRENCE IRVING. *Trans. Roy. Soc. Can.* V, **26,** 141–4(1932).—Five cc. of 2 *N* HCl was administered daily either in the duct or by stomach tube to white male rats Results: The Ca and $CO_2$ of the bones are depleted, the $Ca/CO_2$ ratio is raised, while the P and Ca/P values are not significantly altered. $CaCO_3$ is apparently withdrawn in preference to $Ca_3PO_4$. The combining power of the blood is lowered, but the muscle shows no change in $CO_2$ content. The changes observed in bone appear immediately and the greatest depletion occurs in rats which are not kept over 3 days on the acid diet. L. J. SOFFER

**Anatomical changes in the liver of albino rats fed various fatty substances.** TETSUJI KIMURA. *Trans. Japan. Path. Soc.* **21,** 370–4(1931).—As basic diet a mixt. of butter and cod-liver oil was used, to which were added various fatty acids, lipoids or oils. Vacuolization, fat infiltration and necrosis of liver cells were found. The changes were very marked after cholesterol, oleic acid, lauric acid and stearic acid. Fat infiltration was most marked in the cholesterol diet group. I. S. YUN

**Pathological changes in the teeth due to various diets.** TADASI MASAKI. *Trans.*

*Japan. Path. Soc.* **21**, 693–5(1931).—The ratio of Ca to P in diets is more important than the vitamin D content for the growth and calcification of teeth. I. S. YUN

**Morphological changes of the fore stomach of albino rats kept on specific diets. V. Relationship between the degree of morphological change in the fore stomach and the kinds of fats fed.** YOSHITOMO FUJIMAKI, KUNITARO ARIMOTO, TETSUJI KIMURA, KATSUTOSHI OHBA AND GOSEI MATSUDA. *Trans. Japan. Path. Soc.* **21**, 708–10(1931); cf. *C. A.* **22**, 3913.—Animals fed various fatty acids and lipoids, namely butter and cod-liver oil, in addn. to a basic diet showed different degrees of hyperkeratosis and a typical proliferation of epithelium in the wall of the fore stomach. Such changes were more marked in animals fed diets contg. stearic acid, oleic acid and lauric acid than in animals fed the basic diet alone. I. S. YUN

**Composition of an artificial diet based on prolonged experiments dealing with the relations between alimentation and the phenomena of growth, maintenance and, in particular, reproduction.** LUCIE RANDOIN AND H. SIMONNET. *Compt. rend.* **195**, 1328–30(1932).—The diet developed for white rats has the following compn.: muscle peptone 15, purified casein 2, dry brewery yeast 3, purified butter fat 12, pure rice starch 32, sucrose 32, salt mixt. (Osborne and Mendel) 4%, roughage (filter paper), as desired. Over a period of 3 years, 10 generations were bred successfully. R. P. WALTON

**Lesions of the nervous system in vitamin deficiency. I. Rats on a diet low in vitamin A.** H. M. ZIMMERMAN. *J. Exptl. Med.* **57**, 215–28(1933).—Lesions in the nervous system are described which were produced by a ration contg. no cereals that might have contributed a "toxic" substance to account for the degeneration of the myelin sheaths. A deficiency in unsatd. fatty acids does not appear to have played a role in their development. C. J. WEST

Composition and utilization of Texas feeding stuffs (FRAPS) **12.** The complementary factors in yeast (JANKE, SZILVINYI) **16.** Butterfat variations in cow milk (MACEWAN, LEDINGHAM) **12.**

THOMA, KATHERINE M.: **Food in Health and Disease.** Preparation, Physiological Action and Therapeutic Value. Philadelphia: Davis. 368 pp. $2.75.

## F—PHYSIOLOGY

HOMER W. SMITH

**The fat content of embryonic tissue.** Z. SZANTROCH. *Anat. Anz.* **75**, 46–51 (1932). Histological examn. showed that fat drops appeared in all the cells of chick embryo tissue, but their no., size and arrangement varied according to the kind of tissue or cell. The tissues are classified on the basis of the no. and size of fat globules contained. B. C. BRUNSTETTER

**The formation of fat in the hepatic cell.** J. MCA. KATER AND DOROTHEA M. SMITH. *Anat. Record* **52**, 55–68(1932).—Examn. of liver tissue of rats 8 hrs. after feeding sucrose shows early developing fat globules embedded within the substance of mitochondria. These observations are evidence for the catalytic nature of mitochondrial activity, with reference to fat formation. B. C. BRUNSTETTER

**The effect of the media and the $p_H$ on embryonic brain cultures.** PETER MIHÁLIK. *Anat. Record* **54**, 149–56(1932).—The $p_H$ range of cultures in which nerve-cell emigration and growth of processes occur is 5.8 to 7.8. The optimum is $p_H$ 6.6–6.8. The culture tends to bring the medium to this $p_H$ whether the original reaction was higher or lower than the optimum. The $p_H$ properties of cultures of the connective tissue of the same chick embryos are nearly the same as for nerve cultures. Better growth was obtained in Locke-Lewis soln. than in plasma. B. C. BRUNSTETTER

**Self-sterilizing powers of the skin. III. Carbohydrate metabolism.** THEODORE CORNBLEET. *Arch. Dermatol. and Syphilol.* **26**, 463–5(1932).—Ingestion of 100 g. of glucose at 7 A. M. instead of 9 A. M. produced an earlier, greater and more prolonged depression in the capacity of the skin for self-sterilization. The rate of self-sterilization ran parallel to the rate for the blood-sugar level. Similar values for sterilization rates were found in normal and in diabetic patients; hence the skin's sterilizing power is not related to the abs. amt. of blood sugar. B. C. BRUNSTETTER

**Further investigations on the origin of creatine. VII.** KARL THOMAS, ADE T. MILHORAT AND FRITZ TECHNER. *Z. physiol. Chem.* **214**, 121–38(1933); cf. *C. A.* **26**, 3295.—The tolerance, *i. e.*, max. utilization, of rabbits for ε-guanidocaproic acid, ε-methylguanidocaproic acid, γ-methylguanidobutyric acid and δ-methylarginine is about as great as that for creatine. A patient suffering from progressive muscular dystrophy and excreting creatine was able to utilize 3–5 times as much of the first acid and about the same amt. of the other 3 as of creatine. Glycine and γ-aminobutyric acid increased the creatinuria of this patient, while glutamic acid and hydantoic acid did not

alter it. Methylated guanido acids were recovered from urine through their hitherto undescribed picrolonates. In the recovery of δ-methylarginine a small quantity of *N*-methyl-β(2)-aminopiperidone was obtained, but this must have been formed subsequently by the reagents used. New derivs. described are *ε-methylguanidocaproic acid picrolonate*, m. 249–51°, *γ-methylguanidobutyric acid picrolonate*, m. 252–5°, *ε-guanidocaproic acid picrate*, m. 152° (*picrolonate* m. 236°), *dl-δ-methylarginine flavianate*, m. 231° (decompn.), *N-methyl-β(2)-aminopiperidone picrate*, m. 208°, and *methylarginine picrolonate*, m. 227–8°. Creatine is evidently not an important intermediate in the breakdown of other guanido acids. The former view that creatinine is formed in the body by dehydration of creatine is abandoned. A. W. Dox

**Lysine excretion in the urine in cystinuria.** F. A. Hoppe-Seyler. *Z. physiol. Chem.* **214**, 267–70(1933).—From 60 l. of cystinuric urine 6.1 g. of *5-ω-ureidobutylhydantoin*, m. 198–200°, was isolated, and identified by comparison with a synthetic prepn. obtained from lysine sulfate and $Ba(OCN)_2$. Both prepns. were converted by $HNO_2$ into *5-ω-aminobutylhydantoin* (*chloroplatinate* m. 234–8° (decompn.), *HCl salt* m. 198–200°, *chloroaurate* m. 189–90° (decompn.)). Probably the substance is formed by condensation of lysine with urea during the process of working up the urine. A. W. Dox

**The lactic acid content of normal and of cancerous tissues.** R. Bierich and A. Rosenbohm. *Z. physiol. Chem.* **214**, 271–80(1933).—A summary of previous papers published by B. and R., including discussion of anaerobic and aerobic glucolysis, rate of lactic acid formation, dependence of glucolysis on the nature of the substrate, and the inhibition of resynthesis. A. W. Dox

**Hormone analyses in the urine and the mammary gland secretion.** Egon W. Winter. *Arch. Gynäkol.* **151**, 201–19(1932).—Tests were made for the ovarian hormone and the hormone of the anterior lobe of the hypophysis isolated from the urine and mammary glands of different subjects; castrated mice were used. The following results were obtained: (*a*) In the urine of the newborn the ovarian hormone was found present 3 days post partum, while the hypophysis hormone was found 9 days post partum. There was no hormone present in the mammary secretions of the newborn. (*b*) In the colostrum after 7 months of pregnancy the hypophysis hormone was pos., while the ovarian hormone was absent. (*c*) During the menopause the ovarian hormone was found in the urine. (*d*) In cases of anomalous menses or sterility, the hormones were not present in the urine. L. Eichelberger

**Effect of ovarian hormones theelin and corporin upon the growth of the mammary gland of the rabbit.** C. W. Turner and A. H. Frank. Mo. Agr. Expt. Sta., *Research Bull.* **174**, 3–28(1932); cf. *Anat. Record* **53**, 227.—The injection of theelin in gonadectomized immature rabbits caused the growth of the duct system and slight lobule proliferation comparable to that of the mature virgin rabbit after continuous estrum. Long-continued injection of theelin caused some slight further duct growth. The injection of corporin was ineffective in stimulating the growth of ducts or lobules in the mammary gland. Upon the simultaneous injection of corporin and theelin for 15 days a hyperplasia of the gland lobules was observed resembling the growth of the mammary gland during the first 15 days of pregnancy. It was also possible to stimulate the lactation phase of development normally observed during the second half of pregnancy by means of injections of exts. of sheep pituitary. C. R. Fellers

**Growth and development with special reference to domestic animals. XXV. The course of energy and nitrogen metabolism in the domestic fowl during 48-day fasts—with special reference to the temperament and training of the birds—notes on 60-day fasts in swine.** Virgil W. Phillips, Ural S. Ashworth and Samuel Brody. Mo. Agr. Expt. Sta., *Research Bull.* **179**, 30 pp.(1932); cf. *C. A.* **26**, 5628.—The domestic fowl differs markedly from human beings and from dogs in respect to basal metabolism. Temperament and training are important factors in metabolism and survival. A min. energy metabolism of 400 Cal. per sq. m., or about 35 Cal. per kg., was found on the 20th day of fast. The min. N excretion was 165 mg. of total N per kg. per day on the 12th day, and about 12 mg. total creatinine per kg. per day at the same time. Data are also presented on energy and N metabolism during 2-month fasts in 2 sows. C. R. F.

**Use of geometric mean in determining growth rates.** R. C. Moffat. *Sci. Agr.* **13**, 342–3(1933).—The geometric mean formula is considered more accurate than Minot's modified method. C. R. Fellers

**Cystine and wool production.** A. H. H. Fraser and J. A. Fraser Roberts *Nature* **130**, 473(1932); cf. *C. A.* **23**, 4970.—A brief review which includes exptl. results obtained by the authors in support of an assumption that cystine may be synthesized by the sheep. The hypothesis is advanced that cystine synthesis is a function of the wool follicle. S. B. Foster

**A growth-stimulating substance in fatigued muscle.** H. Munroe Fox and G.

PUGH SMITH. *Nature* **130**, 774(1932); cf. *C. A.* **18**, 3416.—Blow-fly larvae fed with fatigued frog muscle grew larger than those fed on resting muscle, the av. increase being 9%. A search for the substances responsible for this growth stimulation is in progress. S. B. FOSTER

**The carotene of horse blood serum.** ROGER NETTER. *Compt. rend. soc. biol.* **112**, 165–7(1933).—Horse serum does not contain carotene. Its yellow color is due to bilirubin. L. E. GILSON

**Ratio of the sodium salicylate or sodium iodide content of the blood to that of the cerebrospinal fluid.** G. BERUARD AND M. DANIEL. *Compt. rend. soc. biol.* **112**, 176–8 (1933).—Na salicylate appears in the spinal fluid about 2 hrs. after ingestion, it reaches its max. concn., 25% of its concn. in the blood, in 8 hrs., and is all eliminated at the end of 24 hrs. NaI penetrates the spinal fluid less readily, the max. concn., 5% that of the blood, is reached in 6 hrs., and elimination is complete in 12 hrs. L. E. GILSON

**Formation of ammonia in the blood in vitro.** C. VAN CAULAERT, C. DEVILLER AND M. URBAN. *Compt. rend. soc. biol.* **112**, 293–5(1933).—The results confirm those of Parnas and Heller (*C. A.* **19**, 1579). L. E. GILSON

**Action of extract of the anterior lobe of the hypophysis on the lipides of the blood.** J. M. MUNOZ. *Compt. rend. soc. biol.* **112**, 502–4(1933).—Repeated injections of the ext. produce a marked increase in the fatty acids, cholesterol and phospholipides of the blood of normal or thyroidectomized dogs. Ablation of the hypophysis caused a slight decrease of these substances. L. E. GILSON

**Function of the adrenal cortical hormone and the cause of death from adrenal insufficiency.** W. W. SWINGLE, J. J. PFIFFNER, H. M. VARS, P. A. BOTT AND W. M. PARKINS. *Science* **77**, 58–64(1933).—Bilaterally adrenalectomized dogs were kept healthy for months by daily injections of adrenal cortical hormone. The function of the hormone is the maintenance of a normal vol. of fluid in the vascular system. In the absence of the hormone fluid is lost from the blood into the tissues, the blood becomes more concd. and viscous, the pressure falls, and death occurs in 8–12 days. Blood urea and non-protein N increase because of decreased filtration pressure and blood flow to the kidneys, and the vol. of urine decreases. Dogs still live after loss of 40–50% of the plasma and administration of the hormone restores them to normal. A 75% loss of plasma is fatal. Hemorrhage is not compensated without the hormone. The hormone has no direct effect on blood pressure. Symptoms of adrenal insufficiency and traumatic or secondary shock are perhaps both due to failure of blood vol.; if so, the hormone should be beneficial in the treatment of human shock cases. L. E. GILSON

**Phosphatide content [lecithin] of human fetal brains of various ages.** LUIGI CATTANEO. *Ann. ostet. ginec.* No. 5(1932); *Arch. ital. biol.* **88**, 39–48(1932).—Lecithin (percentage and absolute amount) and the lecithin-cholesterol ratio increased regularly in fetuses according to age but were diminished in the suckling. The lecithin value of the fetus was higher in the cerebrum than the cerebellum and *vice versa* for the suckling. HELEN LEE GRUEHL

**The presence in animal tissues of a phosphatase which catalyzes the hydrolysis of borneolphosphoric acid.** LUIGI PELUZZO. *Riv. patol. sper.* **8**, 240–51(1932); *Arch. ital. biol.* **87**, 194–8(1932).—Mascerated dog tissues were extd. with saline and incubated at 37° with K borneolphosphate. The phosphoric acid content was titrated colorimetrically by the Lohmann and Jendrassik method. Phosphatase was found in largest amts. in the pancreas, kidney and brain, in moderate amts. in the liver, spleen and testicles, and in small amts. in the myocardium and skeletal muscle; it was practically absent from the skin. HELEN LEE GRUEHL

**The physicochemical constants of fats in the human fetus, in the pregnant and in the nonpregnant woman.** LUIGI CATTANEO. *Ann. ostet. ginec.* **54**, 483–500(1932); *Arch. ital. biol.* **87**, 199–208(1932).—Fresh fat was extd. in a Soxhlet app. for 10–12 hrs. and detns. were made on the evapd. ether ext. Fetal fat (I) is all solid at body temp. (solidification pt. 22–5°); fat of the nonpregnant woman (II) is all liquid at body temp.; and fat of the pregnant woman (III) is part liquid and part solid. The iodine no. of unsatd. acids is lower in I (45.9–51.5) than in II or III (56.5–70). The av. mol. wt. of I is 241, of III 246.5, and of II 258. There was no great difference in sapon. no. and no uniformity in the acid no. of any of the fats. HELEN LEE GRUEHL

**The reaction of human milk.** WM. PARTRIDGE. *Analyst* **58**, 88–9(1933).—Richmond (*C. A.* **2**, 1989) gives the following values for the acidity of 8 samples of human milk: 5.5°, 2.8°, 3.7°, 3.7°, 3.7°, 4.7°, 9.3° and 5.5°. These would be the "conventional dairy degree" of acidity. Results of analyses on 15 samples made during 14 yr. show that the acidity lies in most cases between 2.0 and 5.5 dairy degrees. The fat, protein, lactose, ash and acidity values of the 15 samples are given. W. T. H.

**The treatment of pernicious anemia by intramuscular administration of liver extract.** E. W. MCHENRY, E. S. MILLS AND R. F. FARQUHARSON. *Can. Med. Assoc. J.*

**28,** 123–32(1933).—A liver ext. prepd. by the method of Strauss, Taylor and Castle for intramuscular administration has been found safe, dependable and effective in adequate dosage. It is about 30 times more potent intramuscularly than *per os*, and the ext. from 10 to 20 g. of liver is as effective intramuscularly as 250–800 g. of fresh liver *per os*. It affords a means of giving large doses to patients where a severe relapse has occurred. The results obtained are not superior to those following ingestion of an adequate amt. of liver or liver prepns. G. H. W. LUCAS

**The total sterol and ergosterol contents of the tissues during the development of the organism.** HERBERT HENTSCHEL. *Z. Kinderheilk.* **52,** 623–46(1931–2).—The absolute total-sterol content of the entire organism increases throughout the period of intrauterine development up to the time of birth, while the relative content becomes stable at the margin of viability. The ergosterol content continues to rise, both relatively and absolutely, with progressive development. In the brain, development and total-sterol content are parallel, while ergosterol increases only during intrauterine growth. After birth it undergoes a relative decrease. In the earliest developmental stages the skin shows its highest relative total-sterol content. Nevertheless the absolute increase during growth is appreciable. Both the total and proportional ergosterol content of the skin increases markedly with increasing age. The liver stores a considerable amount of total sterol, but reaches its relative max. early in childhood, while the max. for ergosterol occurs shortly after birth. Studies on the sterol balance of the laying hen indicate that the animal organism is able to form cholesterol, but not ergosterol. E. M. H.

**The influence of the P substance on the calcium- and phosphorus-balance.** SOPHIE KOCH. *Z. Kinderheilk.* **52,** 664–7(1931–2).—Subcutaneous or intraperitoneal injection of the P-substance (lymphoid tissue hormone) significantly increases the elimination of Ca and P. This leads to a strongly neg. balance, which persists after the injections are stopped. The loss during the injection period, as in rickets, is largely in the stools. Later there is regularly a significant elimination of P in the urine. E. M. H.

**The behavior of glycero- and hexosediphosphatase under the influence of the P-substance. II.** JOSEF SCHMIDT. *Z. Kinderheilk.* **52,** 676–8(1931–2).—In young rats the intraperitoneal injection of the P-substance (lymphoid tissue hormone) induces an appreciable increase of phosphatases in the epiphyseal lines of bones. The values in the kidneys are unchanged, but a significant decrease is noted in the upper part of the small intesine. ELEANOR M. HUMPHREYS

**The alimentary absorption of water and tissue hydration in relation to diuresis.** H. HELLER AND F. H. SMIRK. *J. Physiol.* **76,** 1–38(1932).—In the guinea pig, rabbit and rat, absorption of $H_2O$ from the intestine is much more rapid than its excretion through the kidney. Diuresis is decreased and extrarenal $H_2O$ loss increased in an environment of 37°. Conclusion: The rate of urine formation is not proportional to the then existing degree of hydration in muscle, liver and blood. J. F. LYMAN

**Excitability of the single fiber nerve-muscle complex.** HARRY GRUNDFEST. *J. Physiol.* **76,** 95–115(1932).—The relation between the intensity of an elec. stimulus and the min. duration for which it must be applied to stimulate single nerve and muscle fibers is in agreement with the idea that the excitable substances of nerve and muscle are different and in conflict with the theory of isochronism. J. F. LYMAN

**Normal gas tensions in the mucous membrane of the rabbit uterus.** J. A. CAMPBELL. Proc. Physiol. Soc., *J. Physiol.* **76,** 13P(1932).—O tension is 20 to 45 mm. Hg, $CO_2$ tension is 40 to 60 mm. J. F. LYMAN

**The depressor constituent of muscle extracts.** A. N. DRURY. Proc. Physiol. Soc., *J. Physiol.* **76,** 15–6P(1932).—Cytidylic acid allied to adenylic acid is present in muscle exts. and plays a part in their depressor activity. J. F. LYMAN

**The formation of hemoglobin in the perfused frog. I. Action of hemoglobin and some of its derivatives [hematin, hematoporphyrin, iron-pyrrole, pyrrole and iron].** RODOLFO FERRARI. *Arch. sci. biol.* (Italy) **17,** 25–40(1932).—Expts. were made on *Rana esculenta*. Normal values of hemoglobin and erythrocytes being established, the frogs were perfused with salt soln. and after a few days injected with the substances named. The periodic injection of hemoglobin or of hematin or hematoporphyrin or iron-pyrrole or pyrrole or ferric $NH_4$ citrate always produced a considerable increase in the hemoglobin and red count. The increase was max. after injections of hemoglobin; next in values were hematin and hematoporphyrin; the increase from iron-pyrrole and pyrrole was not so marked and ferric $NH_4$ citrate gave the least response. All these substances enrich the immature forms of erythrocytes with hemoglobin and also stimulate the formation of new erythrocytes. P. F. METILDI

**Muscular contraction without the production of lactic acid.** EMILIO MASTINI. *Arch. sci. biol.* (Italy) **17,** 57–70(1932).—Contracture by heat, caffeine, quinine and K salts occur also in muscles incapable of producing lactic acid. Heat contractures in muscles poisoned by monoiodoacetic acid begin at a lower temp. than in normal muscles.

Decreasing the $p_H$ of the medium in which heat contracture occurs tends to approximate the curve of the poisoned muscle to that of the normal. P. F. METILDI

**Glucose content and activity of the sensory-motor centers in the cerebral cortex of the dog.** G. MARTINO. *Arch. sci. biol.* (Italy) **17**, 169–84(1932).—See *C. A.* **26**, 3025. P. F. METILDI

**The relationship between the oxygen consumption of the intercostal nerve of cattle and oxygen tension.** ALBERT PRAGER. *Biochem. Z.* **257**, 301–6(1933).—For the intercostal nerve of 1.9 mm. diam. the opt. O consumption is in a mixt. with 15–18% $O_2$, and at lower tensions the O consumption diminishes almost proportionally to the diminution in O pressure. S. MORGULIS

**The sugar metabolism of the non-medulated nerve of mammals.** HARRY ROSENBAUM. *Biochem. Z.* **257**, 307–9(1933).—The metabolism of sugar by the splenic nerve is greatest during the first hr. but even then it is only $^1/_4$ as great as in medulated nerves. The sugar metabolism dwindles almost to nothing after the first hr. The O consumption is increased by the addn. of sugar. S. MORGULIS

**The carbon dioxide production of the mammalian nerve under reflex stimulation.** JOACHIM VON LEDEBUR. *Biochem. Z.* **257**, 310–12(1933).—Under reflex stimulation there is no measurable increase in the $CO_2$ production of the peripheral nerve. S. M.

**The ammonia production in mammalian nerve.** KLAUS HALTER. *Biochem. Z.* **257**, 313–24(1933).—The isolated ischiadicus nerve of the rabbit produces 4 to 5γ $NH_3$ per g. and per hr. but considerably more under elec. or mech. stimulation. The $NH_3$ production diminishes under asphyxia and is raised again on subsequent administration of O. In the ischiadicus retaining its contact with the central nervous system the $NH_3$ production for $^1/_2$ to $1^1/_2$ hrs. is 13.4γ per g. and per hr. The reflex stimulation of the nerve causes a 24% rise in the $NH_3$ production, but anesthesia or asphyxia lowers the production considerably. S. MORGULIS

**The carbon dioxide and ammonia production of the non-medulated mammalian nerve.** HARRY ROSENBAUM AND KLAUS HALTER. *Biochem. Z.* **257**, 325–32(1933).—The splenic nerve takes up much more $O_2$ than it produces $CO_2$. The $NH_3$ production at room temp. is of the same magnitude as in medulated nerves, but is increased at body temp. and continues increasing in the course of the expt. This is attributed to a utilization of N-contg. sources as the N-free sources of energy are exhausted. S. MORGULIS

**The mineral components of cartilage.** WALTER SILBER. *Biochem. Z.* **257**, 363–70 (1933).—The ear cartilage of the rabbit has a greater Na content than K content as was found to be the case in other types of cartilage also. The air-dry cartilage has a 4% ash content of which 22% is Na, 12% K, 3% Ca, 2% Mg, 40% $SO_4$, 7% $P_2O_5$ and 15% Cl. About 90% of the minerals were leached out by water in the course of 3 weeks. S. M.

**The problem of the physiology and metabolism of hormones in the organism.** B. M. ZAVADOVSKII. *Endokrinologie* **12**, 81–90(1933).—General discussion. S. M.

**The potassium content of aqueous humor and of plasma.** C. E. RÄIHÄ. *Skand. Arch. Physiol.* **86**, 276–86(1933).—Injection of KCl causes an increase in the K content of both plasma and of the aq. humor. Acidosis brings about no alteration in the K level but it impedes the transfer of KCl from plasma to the aq. humor so that in the latter there is no rise in K after a KCl injection. Alkalosis, on the other hand, causes a fall in the K level of the plasma and of the aq. humor. Insulin produces an effect similar to alkalosis while adrenaline affects the K just as acidosis does. S. MORGULIS

**Passage of cholesterol through the mucosa of the gall bladder.** A. L. WILKIE AND HENRY DOUBILET. *Arch. Surg.* **26**, 110–21(1933).—In normal animals with the cystic duct tied, when the cholesterol concn. in the bile is lower than that of the blood, cholesterol passes from the blood through the mucosa of the gall bladder into the bile, and vice versa. JOHN T. MYERS

**Absorption of dextrose from the colon.** WALTER W. EBERLING. *Arch. Surg.* **26**, 134–52(1933).—Very little dextrose is absorbed from the colon and water absorption is retarded by the presence of the dextrose. JOHN T. MYERS

**Gastric secretion. III. Increased acid secretion in a transplanted gastric pouch during lactation.** EUGENE KLEIN. *Arch. Surg.* **26**, 235–45(1933); cf. *C. A.* **26**, 6001.—In gastric pouches transplanted to the subcutaneous tissues of the abdominal wall and completely sepd. from the old blood and nerve supply, there was an increase in the quantity of secretion and of the concn. of HCl. The causative factor is at least partly humoral. **IV. The effect of atropine on the secretion of transplanted gastric pouches.** *Ibid* 246–57.—In the dog, atropine in non-toxic doses can abolish the secretion of HCl in the Pavlov pouch, and in transplanted pouches. In man it apparently does not abolish the chem. phase of secretion. JOHN T. MYERS

**Physiology of the eosinophile. I. The effect of starvation and exposure to cold on the white blood cells of the guinea pig.** A. IZARD JOSEY AND JOHN S. LAWRENCE. *Folia Haematol.* **48**, 303–12(1932). **II. The effect of subcutaneous and intraperitoneal**

**injection of Escherichia coli on the white blood cells of the guinea pig.** JOHN S. LAWRENCE AND A. IZARD JOSEY. *Ibid* 313–22.—There is a moderate increase in the total no. of white cells, and in the abs. no. of neutrophiles, a marked diminution in lymphocytes and eosinophiles, and no change in the monocytes. Similar results followed the intraperitoneal injection of killed colon bacilli and of diphtheria toxin. **III. The effect of the intraperitoneal injection of ammonium chloride on the white blood cells of the guinea pig.** *Ibid* 323–9.—There is slight and transient increase in the total no. of cells, a neutrophilic leucocytosis, a decrease of eosinophiles and lymphocytes and an inconstant response on the part of the monocytes. This may be due to the products of tissue autolysis. **IV. The effect of intraperitoneal and intravenous injection of sodium bicarbonate solution on the white blood cell picture.** *Ibid* 330–6.—The results were the same as with $NH_4Cl$ when given either intraperitoneally or intravenously, in the guinea pig, dog and man. JOHN T. MYERS

**The hemoglobin concentration of normal English males and females.** C. E. JENKINS AND C. S. D. DON. *J. Hyg.* **33**, 36–41(1933).—The mean hemoglobin concn. of 118 normal English males was about 115% in Haldane's scale when the standard is detd. by the Van Slyke gas app. In 116 women the mean was 100%. There is no foundation for the belief that the English mean differs materially from the American. J. T. M

**The influence of static effort on the respiration and on the respiratory exchange.** T. BEDFORD, H. M. VERNON AND C. G. WARNER. *J. Hyg.* **33**, 118–50(1933). JOHN T. MYERS

**Male hormone. II. Hormone of the testicle of the swine. 1.** A. OGATA, S. HIRANO AND S. HIRATA. *J. Pharm. Soc. Japan* **52**, 1060–85(1932)(in German 187–94); cf. *C. A.* **26**, 5638.—The method of prepg. the hormone exts. and their effect upon the capon by injection are given. F. I. NAKAMURA

**The occurrence of pituitary hormones in the urine in conditions unassociated with pregnancy.** T. N. A. JEFFCOATE. *Lancet* **1932**, I, 662–5.—Prolan A was found in the urine of patients at the menopause after castration, or with malignant disease where the genital tract was the site of the tumor, or where sub-total thyroidectomy had been performed for exophthalmic goiter. Prolan B was never excreted in the urine except when the patient had living chorionic elements present in the body. F. B. SEIBERT

**The effect of strenuous exercise of short duration upon the sugar content of the blood.** O. M. SOLANDT AND G. C. FERGUSON. *Trans. Roy. Soc. Can.* V, **26**, 173–4 (1932).—Strenuous exercise of short duration caused a slight, but definite rise in blood sugar with all of the 9 healthy young male subjects investigated In some instances the increase was more prolonged than in others. In order to show the greater rise in blood sugar after more prolonged exercise, 3 of the subjects ran a mile in 5 to 6 min. It is possible that the rise in blood sugar was due to the excitement of taking the blood samples but this possibility is considered remote. LOUIS J. SOFFER

**The effect of acid upon post-mortal lactic acid formation in mammalian muscle.** LAWRENCE IRVING AND A. ELEANOR C. RIGGS. *Trans. Roy. Soc. Can.* V, **26**, 121–6 (1932).—The authors found that Ringer soln. checked the lactic acid formation of fresh and thawed gastrocnemius muscle both of the dog and rabbit, the inhibitory effect being maximal when 1 cc. of soln. is used for each g. of muscle. HCl reduced the formation of lactic acid, the inhibition increasing with increase in concn. of HCl. The effect is more pronounced in fresh than in thawed muscle. The amt. of inhibition is not equiv. to the amt. of acid added so that acidity alone is not the limiting factor in post-mortal lactic acid formation. The formation of lactic acid is retarded more by the lactic acid formed naturally in the muscle than by the addn. of HCl. LOUIS J. SOFFER

**The origin of the comb-growth-promoting substance in male urine.** D. ROY MCCULLAGH, W. KENNETH CUYLER AND JOHN T. FRAWLEY. *Trans. Roy. Soc. Can.* V, **26**, 183–92(1932).—The comb-growth hormone extd. from male urine maintains the prostate and seminal vesicles in normal condition in castrated rats. The life of spermatozoa obtained from castrated animals could be increased with this hormone. The hormone was obtainable from the body fluids of normal males but was absent in similar fluid of eunuchs. The comb-growth-promoting substance in male urine is sol. in EtOH, MeOH, acetone, $CHCl_3$, $CCl_4$, benzine, pyridine, the hydrocarbons, olive oil, alk. aq. soln. and aq. alc. It is very thermostable, especially in the absence of oxygen. The male sex hormone from the urine is probably a ketone. The testicular hormone and the hormone obtained probably are identical. One bird unit of hormone is that amount of material which, when injected daily for two days, produces a comb growth of 2–4 mm. in at least 4 out of 5 birds. LOUIS J. SOFFER

**Spectrographic proof of the formation of substances by excitation of the cardiac nerves.** Z. M. BACQ AND V. HENRI. *Compt. rend.* **196**, 135–7(1933); cf. *C. A.* 25, 4304.—The frog heart, perfused with Ringer soln., was caused to contract by elec. stimulation of the nerve endings, and the Ringer soln. expressed was collected. The

soln. shows an absorption band in the ultra-violet with a peak at 3150 A. U., while the corresponding soln. from an unstimulated heart shows only general absorption from 2600 down, because of the dissolved salts. The absorption band is ascribed to a diffusible substance produced as an intermediate between the postganglionic sympathetic fiber and the receptor cell, and passing out into the surrounding tissue. K. V. THIMANN

**Female sexual hormones.** G. SANDULESCO, WANG W. TCHUNG AND A. GIRARD. *Compt. rend.* **196,** 137–40(1933); cf. *C. A.* **26,** 4090, 4643.—*Equilenine* (I), obtained from the urine of pregnant mares, forms a picrate, $C_{18}H_{18}O_2.C_6H_2OH(NO_2)_3$, m. 205–8°, which is readily crystallizable, having a soly. in alc. contg. 5% picric acid of 17.5 g. per l. at boiling temp. and 1.0 g. per l. at 20°. The picrate of folliculin (II) is more sol., and the two can be readily sepd. by 2 or 3 recrystns. A simple method for detecting I consists of heating the hormone mixt. to 255° (in boiling biphenyl), when a red color appears. By this means "pure" specimens of II were examd. and without exception were found to contain I in considerable amts. The published phys. consts. of II are, therefore, in error. The following derivs. of I were prepd.: *semicarbazone*, m. 268°; *styphnate* m. 212–3°; *picrate* of the *acetate*, m. 106–7°; and *Me ether* m. 197–8°; the latter gives the equilenine red reaction, but only very slowly. K. V. THIMANN

**A new crystalline sex hormone.** A. GIRARD, G. SANDULESCO, A. FRIDENSON AND J. J. RUTGERS. *Compt. rend.* **195,** 981–3(1932); cf. *C. A.* **26,** 4643.—Besides folliculin, $C_{18}H_{22}O_2$, 2 new hormones have been isolated from pregnant urine. Equilenine (I) $C_{18}H_{18}O_2$ ($\alpha_D$ = +308°) was obtained in a 1.50 g. quantity from 52 tons of urine and hippuline ($\alpha_D$ = +128°) was not obtained in quantities sufficient to be studied. (I) was concd. from urine by alternate fractional extn. in dil. alk. and crystn. from alc. (I) is 12 to 20 times less active than folliculin when tested by the Allen-Doisy procedure ($\alpha^{15°}_D$ = +87° (1% soln. in dioxane) m. 258–9° corr. The acetate of (I) m. 156–157°, the oxime, m. 249–50° corr. Bromination by the method of Rosenmund stops at the stage of a monobromo deriv., m. 225–227° corr. R. P. WALTON

**The effect of splenic extract of various animals on the growth of chicken embryo heart tissue.** K. SHIMIZU. *Japan. Z. Mikrobiol. Path.* **26,** 1412–22(1932).—Splenic exts. of 18 kinds of birds, mammals and cold-blooded animals accelerated the growth of chicken embryo heart tissue. Rabbit spleen ext. was the most effective for this purpose. I. S. YUN

## G—PATHOLOGY

H. GIDEON WELLS

**The antigenic properties of glycogen.** GICHIRO IKEDA. *Japan. J. Med. Sci. VII. Social. Med. Hyg.* **1,** 221–38(1932).—Glycogen of horse, dog and rabbit gives rise to sp. glycogen antibodies in rabbits as indicated by precipitin and complement-fixation reactions. The species specificity, although very sensitive, is not perfect and appears in the form of organ specificity. PHILIP D. ADAMS

**The activity of adsorbed antibodies.** TAKAHARU TOMI. *Japan. J. Med. Sci. VII. Social. Med. Hyg.* **1,** 239–54(1932).—The antibodies (bacterial and hemagglutinin, bacteriolysin, hemolysin, bacteriotropin, tetanus antitoxin) are adsorbed on wood charcoal. Immune substances act as well in the adsorbed state as in soln. P. D. A.

**The carbon and nitrogen in blood filtrate and cerebrospinal fluid.** JOAN CLAUDATUS. *Z. physiol. Chem.* **215,** 10–14(1933).—Detns. of residual C in blood, and total C, total N and residual N in cerebrospinal fluid are reported for a no. of psychopathic patients, and an attempt is made to interpret the data. A. W. DOX

**The iodine-deficiency theory of goiter.** JÁNOS STRAUB. *Magyar Biol. Kutató Intézet Munkái* **4,** 543–5(in German 545–7)(1931).—Waters of goiterous territories contained sufficient I and waters of nongoiterous places did not contain much I. Not only water but all food should be examd. for I. Urine samples of 13 subjects contained much more I than the daily 40 γ, although the water used did not contain more than 0.5–1.5 γ I per l. S. S. DE FINÁLY

**The antigen nature of benzoylalbumins.** J. E. MEDVECZKY AND A. UHNROVITS. *Math. naturw. Anz. ungar. Akad. Wiss.* **48,** 69–109(in German 110–11)(1931).—Immune sera produced from benzoylalbumins gave cross reaction with other benzoylalbumins, with albumins contg. substituted benzoic acid radicals and further with albumin derivs. of aliphatic acids. The reaction was the weaker the shorter the C chain. There was no reaction with the same native albumin from which the benzoyl compd. was produced. The immune serum of the native albumin, however, reacted with the benzoyl compd. made from the same albumin. Benzoylated typhus bacteria produced much stronger immunity than a benzoylated serum albumin. The pptn. was not impeded by Bzona. A definite connection was found between precipitability and quantity of substituted radicals contained by the benzoylated antigen. S. S. DE FINÁLY

**Variations in the antigenic power of diphtheria toxin depending upon the composition of the culture medium.** G. LOISEAU AND M. PHILIPPE. *Compt. rend. soc. biol.* **112,** 131–3(1933); cf. *C. A.* **26,** 2233.—Culture media are discussed, and some expts., similar to those previously described, are reported. L. E. GILSON

**Action of sodium cholate on dysentery toxin. Its antitoxic power in vitro.** C. AUGUSTE. *Compt. rend. soc. biol.* **112,** 199–200(1933).—If Na cholate (cholalate) and dysentery toxin are mixed and injected immediately into a rabbit the usual toxic effects are produced. If mixed and allowed to stand several days at room temp. 0.01 g. Na cholate will completely detoxify 4–5 lethal (rabbit) doses of the toxin. L. E. G.

**Action of manganese chloride and of sodium thiosulfate on intoxication by tuberculin and on the sensitivity of the skin to tuberculin in the case of tubercular guinea pigs.** M. VANDESTRATE. *Compt. rend. soc. biol.* **112,** 357–9(1933).—In the expts. described neither salt had any effect. L. E. GILSON

**Plasmatic and corpuscular hypochloremia and variations in the plasma chlorine-corpuscle chlorine ratio after general surgical operations.** JULES DRIESSENS AND ROBERTE DEVERLY. *Compt. rend. soc. biol.* **112,** 389–91(1933).—**Variations in the corpuscle chlorine-plasma chlorine quotient and its relation to the alkali reserve after general surgical operations.** PAUL BOULANGER AND JULES DRIESSENS. *Ibid* 391–2. L. E. GILSON

**The bromine of the blood in cases of maniac depressive psychosis.** C. I. URECHIA AND MME. RETEZEANU. *Compt. rend. soc. biol.* **112,** 411–12(1933).—Normal human blood contains 0.8–1.0 mg. Br per 100 cc. In cases of maniac depressive psychosis the values were 0.68–0.78 mg. L. E. GILSON

**Variations in blood protein content of the blood in relation to the clinical and hematochemical symptomatology of various types of nephropathy.** CARLO CIPRIANI AND ALDO CIONINI. *Arch. Sci. Med.* **56,** 581–640(1932); cf. *C. A.* **26,** 5318.—In 81 cases of nephropathy hypoproteinemia, hypercholesterolemia and hyperfibrinemia occurred in lipoidal nephrosis and subacute glomerulonephritis, with a lowered, inverted or normal albumin/globulin quotient. In diffuse chronic glomerulonephritis there occurred hypoproteinemia, hypercholesterolemia, hyperfibrinemia and a normal albumin/globulin quotient. Nephrosis with renal amyloidosis showed hypoproteinemia, hyperfibrinemia, low normal, or increased cholesterolemia with a diminished or inverted albumin/globulin quotient. In diffuse acute glomerulonephritis the fibrinemia was increased or normal and the cholesterolemia was low normal in recent forms, increased in protracted forms. Chronic glomerulonephritis in the 2nd stage showed hyperazotemia, acidosis, normal proteinemia, normal or increased fibrinemia and albumin/globulin quotient and slightly higher cholesterolemia. In gravid nephropathy with eclamptic pseudouremia there was hypoproteinemia, normal cholesterolemia and albumin/globulin quotient In postnephritic and orthostatic albuminuria there was generally no change. HELEN LEE GRUEHL

**Ketogenesis and hepatic insufficiency.** G. GHERARDINI AND M. BRASI. *Minerva med.* **1933,** I, 8–14.—In a study of 12 cases no abs. uniformity of results was obtained. There was an indication that ketonuria decreased to a certain point, then increased with the severity of the disease. The total ketones eliminated were in direct proportion to the increase or decrease of diuresis. No definite relation existed between ketonuria and ketonemia. HELEN LEE GRUEHL

**Ketonuria.** G. GHERARDINI AND M. BRASI. *Minerva med.* **1933,** I, 95–8.—A preliminary report is given of ketonuria (Engefeldt method) 2 hrs. before and 2 hrs. after adrenaline injection in 9 hepatic and 9 non-hepatic persons. In general, in both groups the percentage of acetone decreased, the percentages of acetoacetic acid and β-hydroxybutyric acid increased after the injection, while the percentage of total ketones increased or decreased. In hepatics the diuretic effect of adrenaline seemed less marked than in normals. HELEN LEE GRUEHL

**Free and protein sugar in therapeutic pneumothorax.** G. NANNINI AND B. DAVOLIO-MARANI. *Minerva med.* **1933,** I, 139–40; cf. *C. A.* **27,** 1395.—In 11 cases the free glucemia was normal. The protein glucemia was normal when the collapse was complete and increased when the collapse was incomplete. HELEN LEE GRUEHL

**Microbial metabolism and its bearing on the cancer problem.** A. J. KLUYVER. *Science* **76,** 527–32(1932).—An address, pointing out the adaptability of pure cultures in synthetic media for studies in cell metabolism. L. B. HOLLANDER

**The effect of tumor regression and tissue absorption on some properties of the serum.** A. M. BEGG AND H. A. A. AITKEN. *Brit. J. Exptl. Path.* **13,** 479–88(1932).—Extensive bleeding or intratumoral injections of Na oleate into fowls sometimes leads to regression of the Rous tumor. The presence of the Rous sarcoma does not increase the antitryptic property of fowl serum. Fowls immune to cell inoculations of Rous sarcoma have a high serum lipolytic power, and the same applies to animals which

have received intramuscular or subcutaneous injections of surviving foreign tumor tissue. The presence of Rous, Mill Hill, "63," "37S," tar tumors or of injected foreign tissue alters the serum of the tumor-bearing animals, so that the point of flocculation with vanadate-acetic acid is displaced in the direction of lower $p_H$. H. F. H.

**The use of equivalent proportions of antigen and serum in absorption of precipitin.** J. T. DUNCAN. *Brit. J. Exptl. Path.* **13**, 489–97(1932).—Approx. 35 pptg. sera and 85 antigens were used; the results point to the value of equiv. dosage in precipitin absorption, especially when the test is used for the detection of minor antigenic differences between closely related species. The Dean and Webb (*C. A.* **21**, 609) optimal flocculation ratio may be used as a guide to the equiv. antigen-antibody ratio. The tests were used chiefly for the detection of a specific homologous antibody in the supernatant liquids, but some of the expts. suggest that a specific fraction of the heterologous antigen may be present also. A method frequently used was the equiv. absorption, by a heterologous antigen, of a serum which was then used to group other heterologous antigens. The homologous optimal ratio with the supernatant liquid after heterologous absorption may be an index of the integrity of the specific antibody group. H. F. H.

**The relation of optimal agglutination to the equivalent serum-suspension ratio.** J. T. DUNCAN. *Brit. J. Exptl. Path.* **13**, 498–502(1932).—In serum agglutination of bacteria two different optimal agglutinating ratios of serum to suspension can be demonstrated, analogous to the Ramon (*Compt. rend. soc. biol.* **86**, 711(1922)) optimal ratio, and the Dean and Webb (*C. A.* **21**, 609) optimal ratio of serum pptn. reactions. Of the two the Dean and Webb optimal ratio seems to approach more closely to the apparent position of the equiv. antigen-antibody ratio, and it may prove of use as a guide to the dosage in proportional absorption by heterologous suspensions. H. F. H.

**The lipocytic coefficient and alimentation in cancer.** H. PERICAUD. *Néoplasmes* **11**, 291–6(1932).—The lipocytic coeff., or the ratio of cholesterol to lipoidal P, is considerably decreased in cancer. Through its OH group cholesterol has an antitoxic action on the toxins of cancer and becomes toxocholesterol, which is not toxic but inactive. Lipoidal P, especially lecithin, combines with the toxins of cancer to form a toxolecithin which is hemolytic and the cause of the anemia of cancer cachexia. Cholesterol destroys the toxicity of this toxolecithin and sufficient cholesterol should be furnished to neutralize the toxic and hemolytic action of the toxolecithin and to reëstablish the normal lipocytic coeff. Good therapeutic effects in relieving the anemia were obtained in cancer patients by ingestion of 300–350 g. of calf or beef liver, preferably raw, or hepatin if raw or cooked liver was not tolerated. Ordinarily too much lipoid contg. P, and not enough lipoid without P, is given cancer patients. H. F. H.

**Ultra-violet rays and the hemolysis of normal and neoplastic blood cells caused by erythrosin.** A. H. ROFFO. *Néoplasmes* **11**, 351–65(1932).—The irradiation *in vitro* of red blood cells of rats with ultra-violet rays causes hemolysis of an intensity proportional to the dosage given. The reaction is more rapid with red blood cells of mica affected by tumors (sarcoma and carcinoma) than with red blood cells of normal rats. If erythrosin is added, hemolysis is greatly increased. The same differences in speed of reaction, 4–8 times greater in blood from cancerous than normal animals, are noted. Human blood cells, normal and cancerous, show similar behavior. *In vivo* irradiation in both rats and man increases the sensitivity of the red blood cell to erythrosin in proportion to the duration of the irradiation. The sensitivity of the red blood cell caused by irradiation is maintained for as long as 48 hrs. The process of actino-erythrohemolysis appears to be a complicated one in which the fluorescence exerts an influence on the irradiation absorbed, because of its photodynamic properties. Neoplastic red cells are higher than normal in albumin and lipoids, and hence absorb rays more strongly.
HARRIET F. HOLMES

**Chemical studies of the urine with the Sauerbruch-Herrmannsdorfer-Gerson diet.** JOSEPH CSAPO, MARIA PÉTERFY AND ELLA PÁLFY. *Arch. Kinderheilk.* **96**, 231–5 (1932).—Detailed chem. studies of the urine of 6 tuberculous children, on a S-H-G diet, indicate that there is no shift in the direction of an acidosis. If any shift is present, it is toward an alkalosis. ELEANOR M. HUMPHREYS

**Studies on the alimentary allergy of the eczematous child with special consideration to sensitization to egg white.** A. STROBL AND A. WASITZKY. *Monatsschr. Kinderheilk.* **54**, 53–64(1932).—The complement-fixation test demonstrated antibodies against egg white in 5, and against cow milk in 5 of 21 eczematous children. With 4 of the former and 3 of the latter the antibody titer of the serum was, in the eczema zone of Moro, above 1:8100. The cutaneous test to egg white was pos. more often than the serum reaction. In 7 infants who later developed eczema antibodies for egg white were demonstrated once, for cow milk once. In 29 cases of healed eczema in children under 10 years the serum of 3 gave pos. results with egg white, of 6 with cow milk. On the other hand, the skin test for sensitization to egg white was pos. in 16 of 23 of

this group. Sensitization to foods was also shown in 13 cases; in 9 of these the food was egg. This sensitization led to a recurrence of eczema in but 3 instances. In 3 adults with a history of eczema serum antibodies could not be demonstrated although they gave pos. skin tests with egg white and in 2 the Prausnitz-Küstner reaction was pos. ELEANOR M. HUMPHREYS

**The tissue chemistry of infants.** DÉNES v. MÓRITZ AND EDMUND KERPEL-FRONIUS. *Monatsschr. Kinderheilk.* **54**, 371–6(1932).—In these studies of the organs of 15 infants, the Cl, residual N and $H_2O$ contents were detd. The osmotic concn. was found by direct cryoscopy. Hyperosmotic values, found in the tissues of 2 infants who died of infections, were not attributable to dehydration, but to the accumulation of nitrogenous wastes. In an infant demineralized by vomiting the main findings were hyposmotic values and extreme lowering of Cl. ELEANOR M. HUMPHREYS

**Demonstration of Bence-Jones protein in the blood and urine.** OTTO JERVELL. *Norsk Mag. Laegevidenskap.* **93**, 622–31(1932).—In a case of multiple myelomata of the bones Bence-Jones protein (B.-J. p.) was found in the blood and urine, and spontaneous crystn. in the urine took place when it was allowed to stand for The serum coagulated when heated to 56°. The total quantity of protein in the was considerable (9.08%), with a high content of globulin (5.09%) and a lo centage of albumin (3.99%). The serum (0.5 cc.), dild. with 4.5 cc. of salt sol acidulated with 2 drops of 2% AcOH gave, after 2–3 hrs. in a thermostat at white ppt. Control serum, treated in the same way, gave no ppt. The B.-J. isolated from the serum by dilg. the latter with salt water acidulated with ..., heating the soln. to the b. p. and filtering over a boiling water bath. In the filtrate, the B.-J. p. was salted out with $(NH_4)_2SO_4$. When the urine stood some time, relatively large quantities of B.-J. p. crystd. out spontaneously. The crystals dissolved easily in alk. solns. and were pptd. again by acidulation (to $p_H$ 4.3–6.4) with AcOH. The ppt., after a short time, showed typical crystal forms: fine and coarse needles and boat-shaped and spherical crystals. They gave all the reactions characteristic of B.-J. p. Crystals that had been recrystd. 3 times and dried in air were used for the detn. of the isoelec. point of the protein by a special method, which is described. The isoelec. zone was found to lie between $p_H$ 4.0 and 4.25. H. C. M. INGEBERG

**Blood changes in paralytic ileus.** EIVIND HEGGE. *Norsk Mag. Laegevidenskap.* **93**, 1033–59(1932).—Blood chloride and residual N were detd. in the blood from a no. of patients with post-operative intestinal and gastric paralysis, as well as in several cases of peritonitis. and in two cases of paralytic ileus occurring in conjunction with trauma. After operations without complications, performed with narcosis or spinal anesthesia, small changes in chloride and residual N are found A certain tendency to hypochloremia and a slight increase of residual N are noticeable during the 1st days after the operation. Whenever the case is complicated by intestinal or gastric paralysis, the blood chloride at once falls rapidly and a considerable azotemia appears. In peritonitis these blood changes seem to be closely connected with the complicating intestinal paralysis. With respect to these changes in the blood, paralytic ileus is identical with mech. ileus, and the importance of compensating for the loss of chloride and of fluids accordingly is equally great in the 2 cases. Advantages of intravenous injection of hypertonic salt soln. are pointed out, the action of this soln. as a peristaltic is described. H. C. M. INGEBERG

**Titration of the neutralizing potency of antimeningococcus serum by the phenomenon of local skin reactivity.** GRACE M. SICKLES. *Am. J. Pub Health* **23**, 259–60 (1933).—Titration of the neutralizing potency of antimeningococcus serum by the phenomenon of local skin reactivity is possible within certain limits. The significance of the test as an indication of therapeutic value has not yet been established but the simpler technic, although not sufficiently developed to be used as a method of standardization, provides a means for comparison and evaluation and supplies information not obtained with the agglutination test. J. A. KENNEDY

**Lipoid-globulin cholesterol ratios in cancer.** HARRY COKE. *J. State Med.* 41, 105–15(1933).—The original paper should be consulted. J. A. KENNEDY

**The reticuloendothelial system and the source of opsonin.** A. R. ELVIDGE. *J. Immunol.* **24**, 31–64(1933).—Opsonin production is a function of the cells of the reticuloendothelial system, and opsonin is a definite chem. substance. E. R. LONG

**Studies on cultures and broth filtrates of staphylococci.** EARL L. BURKY. *J. Immunol.* **24**, 93–133(1933); cf. *C. A.* **26**, 6016.—Certain strains of staphylococci produce a filtrable substance lethal for rabbits that is not the result of bacterial autolysis or of the decompn. of protein constituents of the culture medium. It is formed in non-protein media. It is produced independently of hemolysins. Production of the lethal factor appears assocd. with a high initial acidity and high end alky. in the culture.

Immunity in rabbits can be induced by intradermal injection of the toxic filtrates. Rabbits younger than 4 months are not susceptible to the lethal action. E. R. L.

**The antigenic property of gelatin-diazo-arsanilic acid.** SANFORD B. HOOKER, WM. C. BOYD, OTIS E. ALLEY AND MATTHEW A. DEROW. *J. Immunol.* **24**, 141–7 (1933).—A serum obtained after injection of gelatin-diazo-arsanilic acid pptd. and fixed alexin in the presence of other proteins coupled with arsanilic acid, and its reactivity was specifically inhibited by phenol-diazo-arsanilic acid and by the gelatin compd. itself. The latter did not react visibly with the antiserum. The results indicate that antigenicity may be conferred upon gelatin by coupling it with an unsatd. cyclic compd.; they do not show that the non-antigenicity of gelatin is due solely to its deficiency in aromatic amino acids; the possibility that other prosthetic groups may be similarly effective has not been excluded. On the basis of certain quant. relationships observed, the suggestion is offered that some diazo proteins may produce 2 or more specifically different anti-haptenes. E. R. LONG

**The relationship of the tuberculin proteins of different acid-fast bacilli to sensitization as indicated by their reactivity in sensitized animals.** FLORENCE B. SEIBERT AND NELLE MORLEY. *J. Immunol.* **24**, 149–56(1933).—Tuberculin proteins from 3 different strains of human type tubercle bacilli induced skin sensitivity roughly parallel to the virulence of the bacilli. On the basis of N content the 3 proteins possessed the same potency for tuberculous guinea pigs. Proteins made by the same method from cultures of bovine, avian and timothy bacilli produced skin reactions of decreasing severity in the order named in guinea pigs infected with the human strain. E. R. LONG

**The laboratory diagnosis of tuberculous meningitis.** ALVIN G. FOORD AND ANNA FORSYTH. *Am. J. Clin. Path.* **3**, 45–54(1933).—The cerebrospinal fluid in tuberculous meningitis is characterized by an increase in the globulin content, decreases in the chloride and sugar contents, an increased cell count, a preponderance of lymphocytes in the differential count, the occurrence of max. pptn. in the 6th and 7th tubes in the colloidal Au test and by the formation of an inverted pine tree web after the fluid has stood for several hrs. E. R. MAIN

**The present status of the serological diagnosis of syphilis with special reference to basic principles.** ROBERT A. KILDUFFE. *Am. J. Clin. Path.* **3**, 61–83(1933). E. R. MAIN

**A case of generalized osteitis fibrosa improved after removal of a parathyroid tumor.** OLE CHIEVITZ AND HANS CHRISTIAN OLSEN. *Acta chirurgica scand.* **71**, 172–204 (1932).—The patient, a woman 25 years old, showed on x-ray examination pronounced osteoporossis with cysts in many of the bones, which on microscopic examn. look like giant-cell sarcona. The serum Ca is 17.6 mg. % while the serum P is 1.6 mg. %. The patient shows a lowered absorption and increased excretion of Ca. On removing a typical parathyroid adenoma all the pathol. conditions disappeared, except for one cyst which persisted. S. MORGULIS

**Further studies on the chemistry of fatty degeneration of the liver.** A. LOEWY AND G. CRONHEIM. *Biochem. Z* **257**, 267–88(1933).—Under reduced barometric pressure fasting guinea pigs lose wt. less than under normal pressure because of a diminished metabolism. The liver loses more wt. than the entire organism and furthermore the fatty transformation of the liver observable under reduced pressure fails to appear in the fasting animal and cannot be detected by changes in the ether ext. The P content, however, of the ext. and to a less extent of the residue is increased over normal. Under reduced pressure in fed guinea pigs there is a great increase in fat and lipoids of the liver, and the acetone fraction shows the highest P content whereas ordinarily the acetone ext. of the liver contains no P. The condition must therefore be looked upon as a fat infiltration from the body fat depots with some new formation of lipoid. But in the fasting animal there is no fatty transformation of the liver but there is an increase in the ether-sol. P as compared with the total P content. Under P poisoning as under reduced pressure there is an increase in ether extractives including the lipoids with a diminution of the P content of the residue. In the fatty transformation through heat there is primarily an infiltration of neutral fat without an increase of the P content of the ether ext., and this is also the condition found in $CHCl_3$ poisoning. In rabbits whose reticuloendothelial system was blocked the fatty transformation of the liver usually observed under diminished pressure did not appear but the P content of the liver did undergo changes. In the P-poisoned rabbits there was an increase in the P content of both the ether ext. and of the liver residue, but especially of the former. This causes a marked rise in the ratio of the ether-sol. P to the total P, which indicates an infiltration of phosphatides besides that of neutral fat. In chickens the results were the same as in the guinea pig. In geese only the effect of overfeeding on the compn. of the liver was studied. The fat under this condition is chiefly neutral fat constituting about 46% of the dry residue, and the P content of both the ether ext. and of the residue is

low. The total N of the fat-free dry substance is lower the greater the amt. of the ether ext. A study was also made of several calf livers. S. MORGULIS

**Studies on the mineral changes in lymph nodes.** PRISKA REINEMER. *Biochem. Z.* **257**, 442–9(1933).—An increase in K, Ca, Cl and partly also of the water content was observed in diseased lymph nodes (solid or caseated tuberculous nodes) of guinea pigs. The K and Cl content diminishes when caseation begins but the Ca content continues to increase. S. MORGULIS

**The etiology of gallstones. I. Chemical factors and the role of the gall bladder.** EDMUND ANDREWS, RUDOLF SCHOENHEIMER AND LEO HRDINA. *Arch. Surg.* **25**, 796–810(1932).—The cholesterol is held in soln. in the bile as a series of both loose and firm chem. complexes with bile salts. Most of these complexes can be broken by relatively slight influences as dialysis, which will ppt. the cholesterol. There is no differential absorption of cholesterol and bile salts by the normal gall bladder. The infected gall bladder absorbs bile salts rapidly but cholesterol slowly if at all. Therefore the bile salt-cholesterol ratio is of supreme importance in the pptn. of cholesterol from bile. **II. Analysis of duct bile from diseased livers.** EDMUND ANDREWS, LEO HRDINA AND L. E. DOSTAL. *Ibid* 1081–9.—In 1 case it was definitely proven that there was a large excretion of unconjugated bile acids. In 3 other cases the same thing was presumed because of high total solids and the dissolving power of the bile for cholesterol. In 1 case the liver bile contained cholesterol crystals. The bile salt-cholesterol ratio is important in the formation of gallstones. **III. The effect of diet on the bile salt-cholesterol ratio.** L. E. DOSTAL AND EDMUND ANDREWS. *Ibid* 258–71.—The cholesterol content of the bile is independent of dietary factors. JOHN T. MYERS

**Experimental illeus. II. High obstruction with the biliary, pancreatic and duodenal secretions, along with food and sodium chloride entering the bowel below the obstructed point.** HILGER P. JENKINS. *Arch. Surg.* **25**, 849–62(1932); cf. *C. A.* **24**, 1670.—Chem. studies of the blood showed no marked fall in chlorides, although in 2 instances there was a slight decrease. The $CO_2$ and non-protein N showed no marked const. change. JOHN T. MYERS

**Experimental obstructive jaundice. Its effect on fibrinogen and coagulation of the blood.** WALTER MOSS *Arch. Surg.* **26**, 1–19(1933).—The fibrinogen content of the plasma is increased in acute obstructive jaundice and the increase parallels the damage to the liver. JOHN T. MYERS

**Experimental thrombosis: the appearance of fibrin in the early stages of formation of white thrombus.** WALTER R. JOHNSON. *Folia Hematol.* **48**, 413–32(1932) —Fibrin appears in the earliest stages of the formation of white thrombus. The blood platelets seem to have the same function as in the coagulation of shed blood, which is the discharge of a substance which interacts with the fibrinogen of the plasma to form threads of fibrin. When the function operates in the face of a strong blood current the globules of fibrin-producing substance are swept away before fibrin threads can be formed; hence most small white thrombi consist solely of platelets. As these grow larger, stagnation permits the formation of fibrin threads. There is a proportional increase in the percentage of fibrin as the thrombus increases in size. This process was artificially reproduced in collodion tubes. JOHN T. MYERS

**Surface properties of intestinal bacteria before and after serum sensitization.** ELEANORE W. JOFFE, CHARLES H. HITCHCOCK AND STUART MUDD. *J. Bact.* **25**, 24–5 (1933).—Sensitization of intestinal bacteria with sp. immune serum gives them cataphoretic properties presumably approaching those of the antibody protein. It is suggested that the antibody globulins against bacteria of this group may be more acid than normal globulins. JOHN T. MYERS

**The lethal radiation from the human body.** OTTO RAHN AND MARGARET N. BARNES. *J. Bact.* **25**, 28–9(1933).—The menstrual toxin is identical with, or closely related to, oxycholesterol. This compd. kills yeast through quartz as do also ether washings from menstruating women. The radiations may therefore be explained by a pathol. excretion of oxycholesterol through the skin. JOHN T. MYERS

**Studies on the protective substance in antipneumococcus serum. XXI. Comparison of certain characteristics of the water-insoluble proteins of antipneumococcus and of normal horse serum.** LLOYD D. FELTON. *J. Bact.* **25**, 76–7(1933). J. T. M.

**The preparation of diphtheria toxoid by treatment of the toxin with one per cent formalin and precipitation with acetone.** AUGUSTUS WADSWORTH, JAMES J. QUIGLEY AND GRETCHEN R. SICKLES. *J. Bact.* **25**, 82–3(1933); cf. *C. A.* **26**, 3293.—The time can be shortened to 5 days. JOHN T. MYERS

**The dissimilarity of the results of precipitin titrations performed with a constant amount of antiserum and with a constant amount of antigen.** G. L. TAYLOR. *J. Hyg* **33**, 12–27(1933).—The proportions of cryst. egg albumin and a given homologous

antiserum favorable for the most rapid particulation are probably const. despite abs. quant. changes. JOHN T. MYERS

**Some observations on cellular immunity to snake venom.** C. H. KELLAWAY AND F. ELEANOR WILLIAMS. *J. Path. Bact.* **35**, 193–7(1932).—Though the results of perfusion expts. may be valid for the demonstration of cellular resistance to poisons in natural antitoxic immunity, it is doubtful if they yield conclusive evidence of acquired cellular immunity. There is no decisive evidence that sp. cellular resistance can be acquired during the course of active immunization with poisons or toxins. There is no evidence of the acquirement of immunity by the tissues apart from that conferred on them by the presence of antitoxic antibody accumulated in the cells or in the tissue spaces around them. JOHN T. MYERS

**Cellular immunity and antibody in the tissue spaces.** F. M. BURNET, C. H. KELLAWAY AND F. ELEANOR WILLIAMS. *J. Path. Bact.* **35**, 199–208(1932).—There is an accumulation of antibody in the tissue spaces of immune animals possessing circulating antibody. This cannot be removed by perfusion and hence the perfusion expt. cannot be used for the demonstration of antitoxic cellular immunity. JOHN T. MYERS

**Some properties of diphtheria antitoxin in the sera of animals of different species.** MOLLIE BARR. *J. Path. Bact.* **35**, 913–28(1932).—Great variations were encountered between the salting-out limits, under the same conditions, of diphtheria antitoxin from sera obtained from actively immunized animals of different species. More than one quarter of the antitoxin was assocd. with the euglobulin fraction of most sera, particularly goose, rat and cow, but in horse serum it never contained more than 2.67%. The proportion was increased by the addn. before dialysis of normal euglobulin. Goose and rat sera contained antitoxin of poor avidity. Guinea pig and rat sera gave typical toxin-antitoxin flocculation, but the sera of other species did not. J. T. M.

**The production of staphylococcal hemolysin with observations on its mode of action.** JOSEPH W. BIGGER. *J. Path. Bact.* **36**, 87–114(1933).—Inorg. or org. salts in the medium have little significance. Added $CO_2$ favors lysin production, but a fermentable carbohydrate such as glycerol plus a phosphate buffer has the same effect. The hot-cold and zone effects during lysis are due to interfering substances in an unfavorable medium as alky. In a few strains $CO_2$ was prejudicial. JOHN T. MYERS

**Production of tumors in the fowl by carcinogenic agents: (1) tar: (2) 1 : 2 : 5 : 6 dibenzanthracene-lard.** P. R. PEACOCK. *J. Path. Bact.* **36**, 141–52(1933).—Connective tissue tumors were produced in fowls by both these agents, varying from benign fibromas to highly cellular fibro-sarcomas. JOHN T. MYERS

**Osteitis deformans.** T. J. O'REILLY AND JOSEPH RACE. *Quart. J. Med.* [N. S.] **1**, 471–97(1932).—The blood phosphatase increased and the serum Ca and P are always normal. The urinary Ca may be high, normal or low. A treatment is described which has modified the biochem. findings. JOHN T. MYERS

**Idiopathic steatorrhea [Gee's disease]. A nutritional disturbance associated with tetany, osteomalacia and anemia.** T. IZOD BENNETT, DONALD HUNTER AND JANET M. VAUGHAN. *Quart. J. Med.* [N. S.] **1**, 603–77(1932).—Steatorrhea and disturbances of Ca metabolism are alone common to the whole group of cases. Many aspects of metabolism were abnormal. The blood sugar tolerance curve was much flatter than usual. The blood urea and Ca were usually low. The blood P was low in 10 and high in 5 cases. The height of the plasma phosphatase coincided with the degree of active changes in the bones. Ca balance estns. showed a high fecal and a low urinary output. The disease may be due to a disturbance of gastro-intestinal function resulting in deficient production, absorption or utilization of one or more essential factors. JOHN T. MYERS

**Cork and complement binding.** F. PLAUT. *Zentr. Bakt. Parasitenk. I Abt.* **126**, 135–7(1932).—It is safer to use rubber instead of cork stoppers for transporting liquids for the complement-fixation reaction because tannic acid from the latter may be anti-complementary. JOHN T. MYERS

**Melanin flocculation in malaria.** M. M. TZECHNOVITZER, E. L. GORSHOVA AND V. D. MOLDAVSKA-KRICHEVSKA. *Zentr. Bakt. Parasitenk. I Abt.* **126**, 419–27(1932).—Melanin flocculation is a valuable diagnostic aid in malaria, is useful in the following treatment, and in epidemiological studies of malaria. JOHN T. MYERS

**The so-called lipoid antigens. The active antigenic principle in alcoholic organ extracts.** A. J. WEIL AND B. RITZENTHALER. *Zentr. Bakt. Parasitenk. I Abt.* **127**, 194–8(1932).—Alc. organ exts. were pptd. with $CdCl_2$ which carries down the lecithin-cephalin group of substances. The acetone-insol. fraction contains cholesterol and carries the antigenic substance. Washing the acetone-insol. fraction of the $CdCl_2$ ppt. with aq. or alc. solns. destroys its activity. The substance is free from sugar. The substance is of unknown chem. constitution. It contains no N, little S or P in the form of the phosphate ion. JOHN T. MYERS

**Physicochemical methods as a guide in the study of syphilis.** ARTHUR VERNES. *J. Chemotherapy* **9**, 73–7(1933).—Blood and spinal fluid tests are aided by means of an app. not described in detail. T. H. RIDER

**Coal-tar constituents and cancer.** J. W. COOK, C. HEWETT AND I. HIEGER. *Nature* **130**, 926(1932).—Several hydrocarbons were isolated from coal tar which were active in producing cancers and which had the typical fluorescence spectrum of carcinogenic fractions. The most active hydrocarbon isolated was *1,2-benzopyrene* which produced cancer in half the time required by 1,2,5,6-dibenzanthracene. Perylene and 4,5-benzopyrene were also isolated. T. H. RIDER

**Microincineration studies of human coronary arteries.** D. Y. KU. *Am. J. Path.* **9**, 23–36(1933).—The ash of coronary arteries is composed almost entirely of Ca salts. It is contained especially in the elastic fibers and increases with age, even in the absence of gross arteriosclerosis. F. B. SEIBERT

**The pathological physiology of inflammation. The effect of histamine on the tissue metabolism.** W. BÜNGELER. *Frankfurter Z. Pathol.* **44**, 1–9(1932).—Injection of histamine in 0.1 lethal dose into the white mouse causes a distinct rise in liver respiration, as measured by the Warburg method. The greatest increase is reached during the first hr. after the injection and there is a return to normal after 2–3 hrs. It is the same kind of rise in metabolism which occurs after the parenteral injection of irritants, inflammation of the skin, Arthus phenomenon or the reinjection of a small amt. of antigen into a sensitized animal. Injection of large doses of histamine results in a checking of the liver metabolism and the animal collapses. Similar changes occur in anaphylaxis. F. B. SEIBERT

**Glucosuria in spirochetosis icterohemorrhagica.** MASAMI KITAOKA. *Japan. J. Med. Sci. VIII. Internal Med. Pediatry Psychiatry* **2**, 239–66(1932).—Glucosuria occurs frequently in spirochetosis icterohemorrhagica. Since it appears after ingestion of food, in mild degree and not throughout the entire course, this phenomenon has been overlooked. Among 18 patients it was found in 11 cases. For the most part the glucosuria in this disease appears in the 3rd or 4th week, seldom before or after. K. S.

**The production of agglutinins and the changes of blood picture after the injection of fat-free typhoid bacilli.** R. YOSHIDA AND K. SHIMIZU. *Japan. Z. Mikrobiol. Path.* **26**, 1401–11(1932).—Agglutinin production decreased after immunization with typhoid bacilli freed from fat by ether and alc. There was also a decrease in erythrocytes, an increase in leucocytes and the appearance of normoblasts. The degree of blood-picture change was marked in comparison with that of rabbits in which fat-bearing typhoid bacilli had been injected. I. S. YUN

GRAHAM, STANLEY, AND MORRIS, NOAH: **Acidosis and Alkalosis.** London: Livingstone. 215 pp. 7s. 6d.

ROFFO, A. H., AND THOMAS, JOSEPH: **La chimie du cancer.** Paris: Vigot frères. 340 pp. F. 50.

## H—PHARMACOLOGY

A. N. RICHARDS

**The colloid chemistry of the nervous systems. VI.** WILDER D. BANCROFT AND JOHN E. RUTZLER, JR. *J. Phys. Chem.* **36**, 3162–74(1932); cf. *C. A.* **26**, 4880.—Goldfish were anesthetized by Na amytal, ether, nembutal, alc. and urethan, and the anesthesia and recovery phenomena were compared. At first sight the theory of reversible agglomeration appears to fail, because Na citrate, Na tartrate and $Al_2(SO_4)_3$ all revive the fish more rapidly than NaSCN, NaCl and NaBr. Na salicylate and $Na_2CO_3$ also revive fish quickly. NaBr, NaCl and NaSCN all revive fish more rapidly than tap water on account of the peptizing action of ions. Elec. shocks bring fish out of anesthesia with supernormal speed. Na citrate acts on a substrate other than that agglomerated by the anesthetics; it ppts. Ca, coagulates the slime on the fish, and agglomerates protein colloids in certain external sense organs. This causes stimulation and apparently wakens the fish; but if they have been in deep anesthesia, they relapse if placed in tap water. $Al_2(SO_4)_3$ stimulates fish by its agglomerating action on external sense organs, recovery time being short; but such revived fish behave abnormally in tap water. Fish "dialyzed" in distd. water go into deeper urethan anesthesia than "undialyzed" fish, but recover more rapidly in NaSCN than in Na citrate. Such fish, when placed in Na citrate solns., act as though anesthetized; this effect is counteracted by NaSCN. Neither osmotic pressure changes nor slight variations in acidity appear to be concerned in recovery from anesthesia. The results confirm Claude Bernard's theory of anesthesia. JEROME ALEXANDER

**Isamine blue treatment of experimental tumors.** G. A. KREUZWENDEDICH VON DEM BORNE AND R. E. J. TEN SELDAM. *Nederland. Tijdschr. Geneeskunde* **76**, I, 1226–32(1932); cf. *C. A.* **26**, 3833.—Isamine blue has a marked influence on inoculated tumors (sarcoma) of mice; it is less marked on spontaneous tumors. In exptl. tar carcinoma the results are poor. R. BEUTNER

**Unconsciousness, apparent death and its treatment by inhalation of carbon dioxide-oxygen mixtures.** G. C. E. BURGER AND M. H. TROMP. *Nederland. Tijdschr. Geneeskunde* **76**, II, 2465–86(1932).—Respiration of $CO_2$ stimulates the brain centers and acts reflexly through the mucous membranes. Indications and contraindications of $CO_2$ treatment for CO poisoning, drowning and elec. shocks are discussed. R. BEUTNER

**Vasano in hyperemesis gravidarum.** H. L. COOPMAN. *Nederland. Tijdschr. Geneeskunde* **76**, IV, 4638(1932).—This drug, contg. hyoscine and atropine, which intensify each others vagus action and are antagonistic in their central action, proved highly efficient in 2 cases. R. BEUTNER

**Intestinal infantilism and its treatment with ventramon.** H. A. STHEEMAN. *Nederland. Tijdschr. Geneeskunde* **76**, IV, 4823–43(1932). R. BEUTNER

**The urinary excretion of phenolsulfonephthalein after arsphenamine.** GEORGE B. ROTH. *Am. J. Syphilis* **16**, 39–51(1932).—The max. tolerated dose of arsphenamine administered intravenously to rabbits almost always produced within 48 hrs. a marked fall in the urinary excretion of phenolsulfonephthalein. B. C. BRUNSTETTER

**Colloidal mercury sulfide in the treatment of syphilis.** WILHELM GENNERICH. *Arch. Dermatol. Syphilis* **165**, 209 *et seq.*; *Am. J. Syphilis* **16**, 198–217(1932).—Hg sulfide, stabilized in colloidal soln. by a hydrolyzed protein, is very well tolerated and exerts an excellent mercurial action against syphilis. It cannot displace arsenicals but can be used in combination therapy. B. C. BRUNSTETTER

**The reaction of tissue culture cells to barium [x-ray] sulfate.** M. J. HOGUE. *Anat. Record* **54**, 307–20(1932).—$BaSO_4$ did not affect the length of life of cultures of chick embryo tissues; they lived from 10 to 15 days in the suspension. Histological reactions of cells in contact with suspended particles of $BaSO_4$ are described. B. C. B.

**Modification of the glucemic level by pharmacodynamic substances as a test of the altered equilibrium of the vegetative nervous system in experimental nephritis.** RAFFAELE MESSINA. *Arch. farmacol. sper.* **54**, 262–84(1932).—Morphine and pilocarpine produce hyperglucemia, and ergotamine causes a slight hypoglucemia, in normal rabbits, as a result of vago-sympathetic stimulation. In the same animals, rendered nephritic by uranyl nitrate, the glucemic level decreases proportionately to the progress of the nephritis. In the nephritic animals the effects of morphine and pilocarpine on the glucemic level are less pronounced than in normal, while that of ergotamine is more marked. These results are explained by the vagotony present in renal insufficiency. LEWIS W. BUTZ

**The effect of certain drugs on heat contracture of the skeletal muscles of the frog.** GIULIO PUPILLI. *Arch. farmacol. sper.* **55**, 44–52(1933).—Drugs which decrease the permeability of the contractile tissue (Ca, curare and sparteine) retard the contraction due to heat, *i. e.*, a higher temp. is required than would be in their absence. In the presence of drugs which increase the permeability (veratrine, eserine, $CHCl_3$ and $Et_2O$) contraction takes place at a lower temp. than in their absence. LEWIS W. BUTZ

**The effect of nicotine on heat contracture of the skeletal muscles of the frog.** GIULIO PUPILLI. *Arch. farmacol. sper.* **55**, 85–8(1933).—Nicotine (1:100,000) increases the permeability of the contractile tissues and hence the contraction of the skeletal muscles takes place at a temp. below normal. LEWIS W. BUTZ

**The physiological action of mineral waters. III. The action of hypotonic waters on the acid-base equilibrium.** UBALDO SAMMARTINO. *Arch. farmacol. sper.* **55**, 53–68 (1933); cf. *C. A.* **25**, 4934. LEWIS W. BUTZ

**The action of some anthraquinone purgatives [aloin, phenolphthalein] and glucoresins [podophyllin, gum ghatti, scammonea and jalappa] on the isolated uterus of the guinea pig.** ETTORE GUIDETTI. *Arch. farmacol. sper.* **55**, 69–84(1933).—The purgatives examd. stimulated the isolated uterus. Since these substances are readily absorbed through the intestinal wall and pass into the circulation, it seems likely that their effect on the uteri of pregnant women is due to a direct action. Only small doses stimulated the isolated uterus, larger doses being relatively inactive. Kymograph records are included. LEWIS W. BUTZ

**Chemico-toxicological study of adrenaline.** GIUSEPPE VENTUROLI. *Boll. chim. farm* **71**, 957–8(1932).—The product formed by the oxidation of adrenaline by putrefying flesh was studied. The flesh in an advanced stage of putrefaction, contg. 0.025 g. adrenaline per 100 g., was made acid with tartaric acid, mixed with a large vol. of 80% alc., heated, cooled, filtered, evapd. to dryness, extd. with abs. alc. and filtered. The alc. ext. was mixed with a little water, shaken with $Et_2O$ to remove fats, the $Et_2O$ re-

moved, the alc. soln. made alk. with $NH_4OH$, extd. with AmOH, the AmOH ext. filtered, and the solvent removed by distn. This gave a reddish brown oil, whose soln. in warm dil. HCl failed to give the usual color reactions for adrenaline, but gave pos. reactions with the Bronardel-Bouty (ferricyanide with a trace of $FeCl_3$) and Jungmann (phosphomolybdic acid and $NH_4OH$) reagents. LEWIS W. BUTZ

**The systematic nomenclature of the effects of drugs given in combination.** EDUARD RENTZ. *Arch. intern. pharmacodynamie* **43**, 337–61(1932).—An attempt to clarify existing confusion as to the significance of the terms sensitization, synergism, desensitization, antagonism, etc. HARRY EAGLE

**Influence of morphine on cats deprived of cortex cerebri majoris.** GYULA MÉHES AND JÓZSA LUSZTIG. *Magyar Biol. Kutató Intézet Munkái* **4**, 495–503(in German 503–5)(1931).—Morphine had an exciting effect on cats deprived of cortex cerebri majoris. Its action was inhibited by treatment with 0.7–1.5 g. NaBr per kg. cat. S. S. DE F.

**Influence of parathoromone on the calcium metabolism of rachitic rats.** JÓZSEF SOÓS. *Magyar Biol. Kutató Intézet Munkái* **4**, 506–15(in German, 515–24)(1931).—The Ca metabolism is not changed by parathormone. The Ca content of the blood serum is increased and the decrease of body wt. is transitorily impeded by it. S. S. DE FINÁLY

**Surface activity and spasmolytic effect.** BÉLA ISSEKUTZ, SR., AND BÉLA ISSEKUTZ, JR. *Magyar Gyógyszerésztud. Társasag Értesitője* **8**, 414–24(1932).—High surface activity is assocd. with high spasmolytic effect. Perparine is higher in both surface activity and spasmolytic effect than are papaverine and eupaverine. Both properties are decreased by substitution of Ph for $PhCH_2$ in papaverine. Substitution caused no change in perparine. These properties of quinine derivs. increase in the order quinine< optochine<eucupine<vuzine. The surface tension of Tyrode soln. of a concn. which decreases intestinal movements 50–80% was decreased from 73 to 50–60 dynes per cm. by papaverine, quinine derivs., camphor, dehydrocholic acid and octyl alc. S. S. DE FINÁLY

**Röntgenographic investigations of irritated and crippled nerve matter.** HANS HANDOVSKY. *Kolloid Z.* **62**, 21–2(1933).—A sharp interference figure is obtained when the spinal cord of a frog is exposed for a short time to $CHCl_3$. The change is due to the orientation of fatty acid chains. ARTHUR FLEISCHER

**Accelerated production of specific urinary pigments by drug administration. II. Effect of diethylsulfonmethylethylmethane on urobilin and urobilinogen formation.** FREDERICK G. GERMUTH. *Am. J. Pharm.* **105**, 30–5(1933); cf. *C. A.* **24**, 3284; **25**, 740.—Administration of diethylsulfonmethylethylmethane (trional) over a period of 7 days increases to a marked extent the proportion of urobilin existing in the body fluid, urine from an av. of 78 mg. per l. in normal urine to an av. of 158 mg. per l. in physiol. urines. Under similar conditions, the quantity of urobilinogen is present in excess of the normal amt.; the increase is not so great as that observed in urobilin, namely, 38 mg. per l. in normal urine and 53 mg. per l. in pathol. urine. A bibliography is appended W. G GAESSLER

**Action of salts of rare earth metals on the development of Brucella abortus Bang in vitro.** A. URBAIN AND P. GORET. *Compt. rend. soc. biol.* **112**, 36–8(1933).—Development was not hindered by the addn. of 0.1–0.2% of the sulfate of Ce, La, Sm, Nd or Pr to the culture medium, but 0.3% of any of the salts checked growth or killed the organism. L. E. GILSON

**Difference in activity of injections of insulin according to the method of administration in the rabbit.** M. CHEVILLOT, J. HARMAND, L. HENNEQUIN AND M. LAMBERT *Compt. rend. soc. biol.* **112**, 65–7(1933).—Subcutaneous injections of insulin have a more pronounced effect than intravenous injections of the same doses L. E. GILSON

**Action of butylethylmalonylurea on the excitability of the nervous centers of the frog.** ALBERT OBBÉ. *Compt. rend. soc. biol.* **112**, 151–2(1933). L. E. GILSON

**Action of theobromine on the fats of the dog kidney.** C. ACHARD, J. VERNE, M. BARIÉTY AND E. HADJIGEORGES. *Compt. rend. soc. biol.* **112**, 155–6(1933); cf. *C. A.* 27, 1403.—The theobromine was fed at the rate of 1–2 g. per day per dog for 7–21 days Certain changes in the kidney fat were detected by histological staining methods. L. E. GILSON

**Anti-tumoral properties of extract of the suprarenals toward experimental epithelioma of white mice.** F. ARLOING, A. MOREL, A. JOSSERAND AND A. BADINAND. *Compt. rend. soc. biol.* **112**, 156–7(1933).—A special method of prepg. the ext. is described. The ext. greatly retarded the growth of the tumor but did not produce a cure. L. E. GILSON

**Morphine addiction. Action of morphine on the isolated intestine of a guinea pig accustomed to morphine, in vivo and in vitro.** JEANNE LÉVY AND R. CAHEN. *Compt. rend soc. biol.* **112**, 167–70(1933). L. E. GILSON

**Influence of light on the toxicity of acriflavine for the rabbit.** M. LEVRAT AND F. MORELON. *Compt. rend. soc. biol.* **112**, 183–4(1933).—Exposing the animal to light after administration of acriflavine does not increase the toxic power of the latter. **Toxic action of small doses of acriflavine on the rabbit.** *Ibid* 184–6.—Although the drug is rapidly eliminated in the urine repeated small doses may produce nephritis and death. L. E. GILSON

**Influence of the injection of ammonium salts on the ammonia content of the blood.** MICHEL POLONOVSKI, GASTON BIZARD AND PAUL BOULANGER. *Compt. rend. soc. biol.* **112**, 193–5(1933).—In dogs the blood of the renal vein is always richer in $NH_3$ than that of the renal artery. The injection of $NH_4$ salts in some unknown way causes an increase in the difference in $NH_3$ content of the renal vein and artery. Slight changes in the $p_H$ of the blood produced by injection of lactic acid or $NaHCO_3$ did not appreciably change the above effect. L. E. GILSON

**Influence of curare on the hypertensive effect of adrenaline.** RAYMOND-HAMET. *Compt. rend. soc. biol.* **112**, 273–6(1933).—In dogs small doses of curare increase, and large doses decrease, the hypertensive action of adrenaline. L. E. GILSON

**Hypoglucemic action of insulin on dogs anesthetized with chloralose.** E. AUBERTIN AND F. TRINQUIER. *Compt. rend. soc. biol* **112**, 316–18(1933).—Chloralose causes hyperglucemia and at the same time increases the hypoglucemic action of insulin to a marked degree. **Hypoglucemic action of insulin on nephrectomized or ureterotomized dogs.** *Ibid* 318–21.—Either bilateral nephrectomy or ligation of the ureters produces a hyperglucemia and at the same time increases the effect of insulin. Both effects increase up to death. L. E. GILSON

**Diuretic action and the elimination of pentoses injected intravenously [in dogs].** P. THOMAS AND A. GRADINESCU. *Compt. rend. soc. biol.* **112**, 415–16(1933); cf. *C. A.* **26**, 3016.—A preliminary note. L. E. GILSON

**Relation between the modifications of the blood and diuresis caused by the introduction of water into the organism.** G. PELLEGRINI. *Arch. pat. clin. med.* **10**, 325–435 (1931); *Arch. ital. biol.* **86**, 61–9(1932).—Ingestion of 1 l. $H_2O$ or phleboclysis with 1 l. physiol. saline in normal adults produced an increase in diuresis, which reached its max. after 30 min., an increase in hydremia paralleling diuresis, diminution of hemoglobin (Bürcker colorimetric method) and total proteins, and a diminution in osmotic pressure corresponding to the increased dilu. of the blood. HELEN LEE GRUEHL

**Pharmacological study of the action of several alkaloids of opium on the uterine muscle fibers.** G. DELLEPIANE. *Rif. ital. ginec.* **12**, 563–84(1931); *Arch. ital. biol.* **87**, 51–64(1932); cf. *C. A.* **26**, 5343.—A study was made of the sep and combined action of morphine-HCl, thebaine-HCl, codeine-HCl, dionine, heroine-HCl, narcotine-HCl, papaverine-HCl and narceine-HCl. HELEN LEE GRUEHL

**Pharmacological study of the mechanism of the action of sulfur as an agent modifying glucemia.** PIETRO M. NICCOLINI. *Minerva med.* **1933**, I, 179–80.—A water-alc.-glycerol soln. of S (0.00022 g per cc.) was injected into rabbits in a dose of 1 cc. per kg. This caused hypoglucemia in normal or splenectomized rabbits and hyperglucemia in rabbits after vagotomy or pancreatectomy. After splenectomy and vagal resection the glucemia remained const. HELEN LEE GRUEHL

**Action of lipoids on carbohydrate exchange and the advantage of insulin therapy associated with egg lecithin.** LUIGI JACCHIA. *Minerva med.* **1933**, I, 209–15.—A review of the literature is given. HELEN LEE GRUEHL

**Therapeutic value of gold tribromide in pertussis.** J. EPSTEIN. *Arch. Pediatrics* **50**, 38–44(1933); cf. *C. A.* **26**, 4871.—Neutral $AuBr_3$ (0.05–0.10 grain administered 4 or 5 times in 24 hrs. in aq. soln. in 75 cases of pertussis) allayed nervous irritability, inhibited the coughing center, relieved the spasmodic attacks and exhibited bactericidal properties. JOSEPH S. HEPBURN

**Benzene: its toxic effects and symptoms and its homeopathic application.** WM. H. DIEFFENBACH. *J. Am. Inst. Homeopathy* **26**, 81–90(1933).—A review. J. S. H.

**The derivatives of fluorescein and their action on the blood cells of normal blood and of blood in cancer.** A. H. ROFFO AND O. CALCAGNO. *Néoplasmes* **11**, 321–41 (1932).—Fluorescein and its di- and tetrabromo derivs. are not hemolytic for the red blood cells of rats. Di- and tetraiodofluorescein are somewhat hemolytic and di- and tetrachlorofluorescein are intensely hemolytic instantaneously. With dibromodichlorofluorescein in 1:100 soln. the hemolytic action is instantaneous. In a 1:500 soln. the hemolytic action is sufficiently diminished that comparison may be made of the degree of hemolysis of blood cells from normal rats and rats with tumors (sarcoma). The hemolytic intensity is 3–4 times greater with the blood cells of the rats with tumors. Further addn. of Br diminishes the hemolytic activity. Different salts were used but the basic element did not seem to alter the hemolytic activity. 117 compounds were

studied and in all cases where a difference could be detected, the reaction was 4 or 5 times as intense with blood cells from animals with tumors. HARRIET F. HOLMES

**The regulation of the ketonemia in liver disease by insulin and sugar.** J. BLÖCH. *Wien. Arch.* **23**, 257–68(1932).—In diffuse injury to the liver parenchyma as in *icterus simplex* there is an increase in the blood of ketone bodies (acetone, acetoacetic acid, β-hydroxybutyric acid) due to disturbance of the intermediary carbohydrate-fat metabolism. The administration of insulin brings about a rapid and marked decrease in the ketone bodies in the blood, which lasts 3–4 hrs. and then is followed by a rise to the previous height or slightly above. Dextrose and levulose reduce the ketonemia only gradually, and in 5 hrs. the former height is not regained. Levulose exceeds dextrose in antiketonic action. In the ketonemia brought about by diabetes, hunger or morbus basedowii insulin has a much more lasting effect in reducing the content of the blood in ketone bodies. H. F. H.

**The action of iodine-free forerunners of thyroxine in hyperthyroidism.** W. RAAB. *Wien. Arch. inn. Med.* **23**, 321–36(1932).—Tyrosine is without effect in hyperthyroidism. Thyronine seems at times to reduce somewhat the increased basal metabolism in hyperthyroidism but its action is irregular and weak. HARRIET F. HOLMES

**The effect of poisoning with irradiated ergosterol on the basal metabolism of guinea pigs and rabbits.** A. NITSCHKE AND M. SCHNEIDER. *Z. Kinderheilk.* **52**, 671–5 (1931–2).—Toxic doses of irradiated ergosterol induced a sudden increase in the basal metabolic rate which persisted until the animals died. ELEANOR M. HUMPHREYS

**The experimental production of intoxication in animals by the enteral route.** ALICE CHASSEL AND S. ROSENBAUM. *Monatsschr. Kinderheilk.* **53**, 399–413(1932).—The toxic symptom-complex is readily induced in dehydrated dogs when *E. coli* endotoxin is administered parenterally, but not when given in much larger doses by mouth. Mixts. of various amines, including ethyl- and methylamines, tyramine, putrescine and cadaverine were effective. ELEANOR M. HUMPHREYS

**The influence of salyrgan on glucosuria.** C. SINDING-LARSEN. *Norsk Mag. Laegevidenskap.* **93**, 649–60(1932).—The results first described by Bix and Wechsler (*C. A.* **26**, 520) are confirmed. Salyrgan reduces the glucosuria in diabetes, while, at the same time, it increases the blood sugar. In cases of diabetes without glucosuria salyrgan has no influence on the blood sugar. S.-L. attributes the effect to an increased kidney threshold and believes that it is difficult to explain without accepting the theory of filtration. H. C. M. INGEBERG

**The use of pernocton in surgery.** CARL SCHULTZ AND IVAR MOENE. *Norsk Mag. Laegevidenskap.* **93**, 974–84(1932).—Pernocton, used in over 200 operations as an anesthetic, alone and in connection with local anesthesia or ether narcosis, proved to be harmless and valuable. Its use in ether narcosis permits reduction of the quantity of ether 60–70%. H. C. M. INGEBERG

**Various treatments of epilepsy, especially the ketogenic diet treatment and its effect upon the organism.** ODD WAAGE HAVREVOLD. *Norsk Mag. Laegevidenskap.* 93, 1095–104(1932).—The variations in the compn. of urine, blood and spinal fluid were investigated which result from the treatment of epileptic patients with a ketogenic diet (a diet rich in fat and poor in carbohydrates) and from the treatment with acid salts (daily doses of 0.5–1 g. per kg. body wt. of $NH_4Cl$ or $NH_4H_2PO_4$). Results with a ketogenic diet: Acidosis is apparent in the blood, urine and spinal fluid, and may also be measured quantitatively. The content of acetone in the blood varies considerably, from 0.1 to 0.25 per mille, during a 24-hr. period, as the ketone effect is greatest after meals. In the fasting state, no acetone is found in the blood. The spinal fluid has a higher content of acetone than the blood, 0.15–0.50 per mille; small quantities are found also in the fasting state. Typical variations of the $p_H$ of the biol. fluids were observed: in the urine, the $p_H$ varies between 5 and 6.5; in the blood, the $p_H$ is practically const., about 7.65; the alkali reserve of the blood is also practically const. In the spinal fluid, however, where the $p_H$ normally lies between 7.60 and 7.65, a ketogenic diet rapidly brings the $p_H$ down to about 7.50, the lowest value observed being 7.41. Results with acid salt treatment: The $p_H$ of the urine goes down to about 5, the $p_H$ of the spinal fluid to 7.45–7.55. The alkali reserve and the $p_H$ of the blood remain practically const. The heating effects of the treatments, however, are rather doubtful. The methods used for the detns. are described in detail. H. C. M. INGEBERG

**Relation between chemical constitution and action of chemotherapeutic compounds.** L. BENDA. *Angew. Chem.* **46**, 85–7(1933). KARL KAMMERMEYER

**Phosphorus poisoning.** J. SEDLMEYER. *Deut. Z. ges. gerichtl. Med.* **19**, 365–83 (1932).—Chem. analysis is insufficient. Histological examn. is essential. F. K

**The psychopathologic symptoms in lead poisoning and their significance.** H. A SCHMITZ. *Deut. Z. ges. gerichtl. Med.* **19**, 391–408(1932). FRANCES KRASNOW

**Complete replacement of air by steam as a cause of experimental death.** G.

GUARESCHI. *Deut. Z. ges. gericht. Med.* 19, 409–14(1932).—In free-flowing steam asphyxia is caused by excess water. If the steam is allowed to accumulate under pressure death results from primary inhibition of breathing. FRANCES KRASNOW

**Pathological anatomy of acute sodium fluoride poisoning.** H. GELLERSTEDT. *Deut. Z. ges. gericht. Med.* 19, 475–87(1932).—The fatal dose approximated 1 g. and max. duration of suffering was $3^1/_2$ hrs. There was (1) intense hyperemia of stomach and intestine, fatty degeneration of the heart muscle, liver and kidney, (2) a leucocytosis of heart, liver, spleen and kidney, (3) hemolysis. FRANCES KRASNOW

**Effect of sodium stannite on hemoglobin.** OTTO SCHMIDT. *Deut. Z. ges. gericht. Med.* 19, 516–17(1932).—Treatment with $Sn(ONa)_2$ leaves the spectrum unchanged for pure CO-hemoglobin. If the blood is not completely satd., there appears a definite line in the yellow. Utilization of $Sn(ONa)_2$ is specially valuable for very small quantities of CO. FRANCES KRASNOW

**Fatal poisoning with oil of chenopodium.** A. IBRUS-MÄÄR. *Deut. Z. ges. gericht. Med.* 20, 158–60(1932).—Extraordinary cerebral edema was produced. F. K.

**Action of magnesium salts on skin sensibility.** BORIS BELONOSCHKIN. *Z. Biol.* 93, 73–8(1932).—Intracutaneous administration of various concns. of $MgCl_2$ depresses the sensibility for approx. 40 min. Antagonism between Mg and Ca could not be demonstrated. FRANCES KRASNOW

**Reversible coagulation in living tissue. XI.** WILDER D. BANCROFT, ROBERT S. GUTSELL AND JOHN E. RUTZLER, JR. *Proc. Natl. Acad. Sci.* 19, 85–91(1933); cf. *C. A.* 26, 1977.—Chronic alcoholism is benefited by NaCNS, peptization therapy. "The treatment has not been, and probably cannot be standardized." W. D. LANGLEY

**Effect of pituitrin introduced into cerebrospinal fluid on the action of the kidneys.** HENRYK SIKORSKI. *Med. Doświadczalna Społeczna* 15, 267–93 (in German 293–4) (1932).—Intralumbar injections of doses of pituitrin which are inactive if given subcutaneously caused a diminution of the urine secretion in dogs, while in rabbits they showed no effect. The same antidiuretic action was obtained in dogs by intralumbar injections of a strong acid, $BaCl_2$, ephetonine and ephedrine in doses which are inactive if given subcutaneously. The intralumbar action of pituitrin is, therefore, not specific. Injection of such doses of pituitrin into the cistern had no effect on diuresis in dogs and rabbits. Similar doses of a strong acid, $BaCl_2$, ephetonine and ephedrine when injected into the cistern showed no action in rabbits. These results contradict the assumption of a central effect of pituitrin on the action of the kidneys by means of a special water center. The antidiuretic effect of pituitrin appears to be rather peripheral. Sixty-one references are appended. S. LAUFER

**Fifth suggestion for the application of the salts of phosphoric acid ester. The treatment of trachoma follicularis with yatoconin.** SEIGO FUNAOKA, TADAHIKO TSUBOI, HIROSHI OTA AND KONIN OKAMOTO. *Arb. dritt. Abt. anat. Inst. kaiser. Univ. Kyoto Ser. C.*, No. 3, 1–6(1932).—Yatoconin is a purified prepn. of the Ca salt of fructose-monophosphoric acid. Five cases afflicted with trachoma follicularis were treated by subcutaneous and intravenous administration of the drug. The resorption of the follicular formations occurred more rapidly than in the cases under the usual treatment, and left no scars. A slight swelling of the mucosa persisted. The resorption of the follicles, therefore, is no indication of a complete and permanent cure. B. S. L.

**The treatment of trachoma with yatoconin.** KONIN OKAMOTO. *Arb. dritt. Abt. anat. Inst. kaiser. Univ. Kyoto Ser. C*, No. 3, 79–90(1932).—Excerpts of 36 case histories are presented. The therapeutic results are similar to those given in the preceding abstr. B. S. LEVINE

**The treatment of trachoma with yatoconin.** HIROSHI OTA AND TAMOTSU TANAKA. *Arb. dritt. Abt. anat. Inst. kaiser. Univ. Kyoto Ser. C*, No. 3, 91–8(1932). B. S. L.

**Further application of yatoconin in the therapy of trachoma.** HIROSHI OTA. *Arb. dritt. Abt. anat. Inst. kaiser. Univ. Kyoto Ser. C*, No. 3, 101–10(1932). B. S. LEVINE

**Yatoconin therapy in periphlebitis retinae tuberculosa.** KONIN OKAMOTO. *Arb. dritt. Abt. anat. Inst. kaiser. Univ. Kyoto Ser. C*, No. 3, 59–61(1932).—Generally, no beneficial effect was observed in several clinical cases. B. S. LEVINE

**Pyrophosphatase in the sputum of patients afflicted with tuberculosis of the lungs.** YOSHIKI IMAGAWA. *Arb. dritt. Abt. anat. Inst. kaiser. Univ. Kyoto Ser. C*, No. 3, 99–100(1932); cf. *C. A.* 26, 2782.—The enzyme is found in considerable quantity in the sputum of most tuberculous patients. The prognosis of cases, in whose sputum no pyrophosphatase is demonstrable, is not favorable. B. S. LEVINE

**Differentiation of optically isomeric and related cinchona alkaloids by quinine-sensitive subjects.** W. T. DAWSON, J. P. SANDERS AND L. M. TOMLINSON. *J. Immunol.* 24, 173–83(1933).—The results of skin tests in 3 quinine-sensitive subjects with 42–48 cinchona alkaloids, including several pairs and one quartette of optical isomers, and with some chemically related substances, show that the allergic reactions rest on some-

what different chem. bases in all 3 cases. In the optically isomeric quartette quinine (*ddll*-), epiquinine (*ddld*-), epiquinidine (*dddl*-) and quinidine (*dddd*-) all 3 subjects had allergic reactions to quinine that did not appear on administration of quinidine, and from skin tests they were possibly insensitive to both epialkaloids also. E. R. LONG

**The use of avertin in multiple dressings: effects on the liver.** L. H. MCKIM AND WESLEY BOURNE. *Can. Med. Assoc. J.* **28**, 149–51(1933).—Avertin in doses of 6–7 g. has been administered up to 22 times in less than 10 weeks to a patient (17, 18 and 21 times to 3 other patients), without evidence of tolerance or tendency to habit formation. Liver function tests over this period by the bromosulfalein dye retention test indicate no appreciable liver damage. G. H. W. LUCAS

**Clinical experiences with avertin anesthesia.** K. M. HEARD. *Can. Med. Assoc. J.* **28**, 151–7(1933). G. H. W. LUCAS

**Changes in bone sarcoma after intravenous injections of a colloidal solution of metallic arsenic.** A. C. HENDRICK AND E. F. BURTON. *Can. Med. Assoc. J.* **28**, 192–4 (1933).—A case of bone sarcoma of the femur which did not respond to high-voltage x-ray treatment was treated with colloidal As 3 times a week, 0.5–0.8 cc. being given intravenously for over 6 months with very good results. G. H. W. LUCAS

**Habituation of fibroblast cultures to methanol.** SABURO KIRIHARA. *Folia Pharmacol. Japon.* **15**, No. 1, 10–17 (Breviaria 2)(1932); cf. *C. A.* **26**, 5983, 6016.—Fibroblast cultures develop a resistance to MeOH when it is added gradually to culture media. **Habituation of fibroblast cultures to propyl, butyl and amyl alcohols.** *Ibid* 18–28(Breviaria 2–3)(1932).—Fibroblast cultures become habituated to Pr and Bu alcs. but not to Am alc. It is more difficult to develop habituation with these alcs. than with EtOH and MeOH, and weaker concns. must be employed. G. H. W. LUCAS

**The action of sinomenine, parasinomenine and quinine on the pregnancy of rabbits.** FUKASHI YAGI. *Folia Pharmacol. Japon.* **15**, No. 3, 179–84(Breviaria 13)(1933); cf. *C. A.* **27**, 1051.—Injection of the above drugs into rabbits in the early part of pregnancy terminates it. Frequently one injection is sufficient, although repeated injections may be necessary, depending on the concn. of the solns. employed. It requires about 20 mg. sinomenine and about 10 mg. parasinomenine or quinine per kg. to produce the effect. Sinomenine acts more slowly than the other two. G. H. W. LUCAS

**The combined action of sinomenine, parasinomenine or quinine with pituitrin on the pregnancy of rabbits.** FUKASHI YAGI. *Folia Pharmacol. Japon.* **15**, No. 3, 240–3 (Breviaria 17)(1933).—Following treatment of the gravid rabbit uterus with sinomenine, parasinomenine or quinine, pituitrin produces a stronger effect. This action is increased if the pituitrin is added a short time after the other drugs. The pituitrin action is strongest with quinine and weakest with sinomenine. G. H. W. LUCAS

**Combination experiments on magnesium and calcium with morphine with regard to the influence on the blood sugar.** KAZUTERU AKIMOTO. *Folia Pharmacol. Japon* **15**, No. 3, 185–92(Breviaria 13–14)(1933).—The blood sugar in rabbits is increased by $MgSO_4$ (0.2 g.) and $CaCl_2$ (0.01 g.) per kg. injected subcutaneously. With much smaller doses of $MgSO_4$ (0.008–0.03 g. per kg.) and $CaCl_2$ (0.005 g. per kg.) the blood sugar is not changed, but the hyperglucemic action of morphine is greatly increased. Larger doses have no influence on the morphine action. Much larger doses of the salts have some effect, but not in the same degree as the smaller doses. The quantities of these salts which have a synergistic or sensitizing effect on morphine lie within narrow limits. G. H. W. LUCAS

**Pharmacological investigation on in-vitro cultures of the pigmented epithelial cells of the iris. V. The influence of digitalin [Merck], digitalein [Merck], digifolin [Ciba], and pangitals [Sankyo] on the growth of in-vitro cultures of iris epithelium and the histological changes in the cultures through these poisons.** KANO SANJO. *Folia Pharmacol Japon.* **15**, No. 3, 193–204 (Breviaria 14–15)(1933); cf. *C. A.* **27**, 1404.—The above drugs in weak concn. accelerate the growth of the cultures, but with increasing concn. the acceleration decreases. With high concn. growth is inhibited, degeneration follows and the cultures die. Histological changes are described. **VI. The influence of *k*- and *g*-strophanthin [Merck], helleborein [Merck], convallamarin [Merck] and adonidin [Merck] on the growth of in-vitro cultures of iris epithelium and the histological changes in the cultures through these poisons.** *Ibid* 205–17 (Breviaria 15)(1933).—These drugs act similarly. In weak concn. they promote the growth of the cultures; in higher concn. they inhibit it so that degeneration and death follow. Histological changes are described. G. H. W. LUCAS

**The cumulative action of various drugs of the digitalis group on cultivated tissues. II.** TOMONORI MANABE. *Folia Pharmacol. Japon.* **15**, No. 3, 218–27(Breviaria 15–16) (1933); cf. *C. A.* **27**, 1051.—Cultures of fibroblast in which the growth has been stimulated by small concns. of digitalein, digitalin, *k*-strophanthin and convallamarin, when placed suddenly in normal media soon return to normal growth. This return is more

rapid after *k*-strophanthin than after the other three. These drugs have a cumulative action on the cultures; that of digitalein and digitalin is more distinct than that of the other two. III. *Ibid* 228–39(Breviaria 16–17).—When a culture is treated with one of the digitalis group by several passages through a soln. of the drug and is then placed in a medium contg. another member of the group in a certain concn., various changes are observed. The cultures show the same growth if the drugs used in each case have no cumulative action, but if the drugs differ in respect to cumulative action, the growth of the cultures also varies. The action of the second drug on the growth is stronger and of longer duration, because of the influence of the first drug, according to the degree of accumulation of the first drug. G. H. W. LUCAS

**Experimental study of mercury poisoning. I. The influence of water and Ringer solution on mercury poisoning.** MAKOTO KUSE. *Folia Pharmacol. Japon.* **15**, No. 3, 244–58 (Breviaria 17–18)(1933).—Rabbits fed on oats were more resistant to Hg poisoning than those fed on bean jelly. After 5–15 mg. novasurol per kg. a considerable diuresis appeared in 3–6 days; 18–20 mg. had much less effect and was even antidiuretic. Male rabbits which, after a lethal injection of novasurol, were given 200 cc. water perorally for three days died from diarrhea. If the water was given prior to the novasurol, the rabbits lived longer. Intravenous administration of 200 cc. Ringer soln. soon after the novasurol injection showed a good effect. If the Ringer soln. was delayed a few days, most of the rabbits died. G. H. W. LUCAS

**The point of attack of pituitrin on antidiuresis and on sodium chloride excretion.** YOSHIAKI FUJIMOTO. *Folia Pharmacol. Japon.* **15**, No. 3, Opera Orig 19–26.—Since pituitrin diuresis appears in rabbits 3–5 min. after intravenous injection, 5–7 min. after subcutaneous and 15–20 min. after intracisternal, and also since indigo carmine injected in the same way shows a similar effect, it is assumed that pituitrin acts on the kidney. Furthermore, after section of the cervical cord and of the vagus, the results from the injections appear earlier than in the normals. As the excretion of NaCl after denervation, and in the normals, remained the same, the point of attack of pituitrin must lie in the kidney itself. G. H. W. LUCAS

**Chemical action of sodium citrate as a cause of certain transfusion reactions.** A. S. MINOT, KATHARINE DODD AND RAY BRYAN. *Am. J. Diseases Children* **45**, 32–40 (1933).—Transfusions of blood contg. 0.5% Na citrate into dogs after the reduction of the blood Ca by parathyroidectomy, by injections of guanidine-HCl or by induced alkalosis are followed by severe reactions characteristic of acute lack of Ca. The symptoms are relieved by the injection of Ca salts. The harmful reactions which sometimes follow blood transfusion in infants may be due to the reduction of the blood Ca by citrate, the reaction being especially marked in infants whose blood Ca is below normal. E. R. MAIN

**The use of radiostoleum and calcium salts in rheumatism.** EDWIN C. WARNER. *Arch. Disease Childhood* **7**, 273–6(1932).—The administration of vitamins A and D as radiostoleum, together with Ca gluconate, tends to prevent relapses of chorea and subacute rheumatism, but does not appear to prevent the onset or relapse of carditis or to increase the Ca content of the blood. E. R. MAIN

**The effect of liver extract on bile-pigment formation.** M. S. KIM. *J. Lab. Clin. Med.* **17**, 1223–7(1932).—The oral administration of liver exts. which are active therapeutically in pernicious anemia appears to have no effect on the nutritional condition or on the output of bile pigment in dogs with biliary fistulas. E. R. MAIN

**Carbon dioxide changes in alveolar air and blood plasma or serum after subcutaneous histamine injection in human beings.** LAY MARTIN AND MORTON MORGENSTERN. *J. Lab. Clin. Med.* **17**, 1228–36(1932).—The $CO_2$ contents of the alveolar air and blood plasma of individuals whose gastric secretion is normal are usually increased following the injection of histamine, while those of individuals whose gastric juice contains no HCl may be either increased or decreased. E. R. MAIN

**Gastric secretion of normal Chinese after histamine stimulation.** HSIAO-CH'IEN CHANG AND HSIEN-LIN CHANG. *Chinese J. Physiol.* **6**, 321–331(1932).—The gastric juice, both in fasting and after histamine stimulation, of normal Chinese subjects was studied as to its vol., acidity and total chloride content. The data showed no marked deviation from the normal standards of Occidentals. L. A. MAYNARD

**The influence of active and inert gases on the fragility of the red blood corpuscles.** QUINTO CALABRO. *Arch. intern. pharmacodynamie* **40**, 236–45(1931).—Gases capable of uniting with hemoglobin ($O$, $CO_2$, CO) diminish the min. and max. resistance of red blood cells, both *in vivo* and *in vitro*, with the exception of O, which increases the max. resistance slightly. Hemolysis of the cells to which these gases have been added occurs with NaCl at a higher concn. The inert gases (H and N) incapable of combining chemically with hemoglobin produce only a slight change in the fragility of the cells. These facts are in accord with other observations *in vivo* or *in vitro* on red cells treated with

other inert gases. The behavior of the red blood cells under these conditions is explained on a varying toxicity of the employed gases for the cells and on their property to form more or less stable compds. with hemoglobin. P. F. METILDI

**Modifications of the physicochemical constants of the blood during narcosis.** COSIMO DI GIOIA. *Arch. intern. pharmacodynamie* **42**, 39–47(1932).—The f. p. of the blood of dogs under narcosis by $CHCl_3$ steadily rises, but this is transitory and it does not parallel the duration of narcosis. The elec. cond. is also increased. The dielec. const. is increased also, but not as much. The surface tension and $n$ do not change. P. F. METILDI

**Thallium. III. Acute poisoning from thallium acetate. Toxicology of the metal.** P. TESTONI. *Arch. intern. pharmacodynamie* **42**, 48–64(1932); cf. *C. A.* **25**, 5930.—A description of a case of Tl poisoning and review of the literature with an extensive bibliography. P. F. METILDI

**Strychnine poisoning and magnesium sulfate.** EMILIO TRABUCCHI. *Arch. intern. pharmacodynamie* **42**, 65–86(1932).—Simultaneous injection (subcutaneous, intramuscular and intravenous) of $MgSO_4$ and lethal doses of strychnine into 29 rabbits failed to show a definite and const. antagonism between the two drugs *in vivo*. Injecting the drugs at different times did not show any difference in the effects. Expts. *in vitro* did not indicate any pptg. or inactivating action of $MgSO_4$ on strychnine. P. F. M.

**Pulmonary distribution of nebulized liquids.** P. SPOTO. *Arch. intern. pharmacodynamie* **42**, 87–102(1932).—In dogs and rabbits, nebulized liquids penetrate to the bronchioles and alveoli. The amt. which reaches these structures varies but is small. The distribution is irregular, being a max. near the hila. The position of the animal does not seem to influence the ultimate distribution. P. F. METILDI

**Penetration and distribution in the lungs of liquids injected intratracheally.** P SPOTO. *Arch. intern. pharmacodynamie* **42**, 103–116(1932).—See *C. A.* **26**, 1346. P. F. METILDI

**Histological investigations on the toxic action of cinchophen.** A. RISI. *Arch. intern. pharmacodynamie* **42**, 117–27(1932).—Cinchophen administered parenterally has a m. l. d. of 0.62 g./kg. in dogs, 0.90 g./kg. in guinea pigs and 0.95 g./kg. in rabbits. It has no cumulative action and is not habit-forming. The organs affected primarily are liver, kidneys and myocardium. The histologic characteristics are vacuolization, cloudy swelling, fatty degeneration of protoplasm with pyknosis, karyolysis and karyorrhexis of the nuclei. P. F. METILDI

**The antidotal effect of sodium tetrathionate in hydrocyanic acid poisoning.** A. CHISTONI AND B. FORESTI. *Arch. intern. pharmacodynamie* **42**, 140–72(1932).—Animal expts. demonstrate the efficacy of $Na_2S_4O_6$ as an antidote in HCN poisoning. Its action is rapid and is superior to that of the other antidotes in use ($Na_2S_2O_3$, colloidal S, etc.) Its action seems to rest on the transformation of HCN to HCNS. P. F. METILDI

**Behavior of the glucose in eggs after administration of saiodin.** MARCELLO BIASOTTI. *Arch. intern. pharmacodynamie* **42**, 305–10(1932).—The administration of saiodin (Ca monoiodobehenate) to chickens produces a diminution of the glucose content of the eggs. P. F. METILDI

**Thermal reactions of the nasal mucosa induced by vasomotor drugs.** GIORGIO MANCIOLI. *Arch. intern. pharmacodynamie* **42**, 311–27(1932).—Adrenaline, cocaine, percaine and amyl nitrite induce notable variations in temp. of the nasal mucosa in man as measured by thermocouples. P. F. M.

**Sodium dimethylarsinate and disodium monomethylarsinate. I. Toxicity of sodium cacodylate and anatomopathologic alterations from its poisoning.** ITALO SIMON. *Arch. intern. pharmacodynamie* **42**, 283–304(1932).—The immediate m. l. d (intravenous) for rabbits is 1.21 g./kg. body wt.; the late m. l. d. is 0.40 g. The m. l. d (subcutaneous) is 0.50 g. The immediate toxicity is related to the speed of injection. Death is due to depression of the circulatory and respiratory functions, together with some histological changes in the nervous system. P. F. METILDI

**The action of cyanides, guanidine and acetylcholine on the heart at different $p_H$ values.** VIRGILIO MARTINI. *Arch. intern. pharmacodynamie* **43**, 63–6(1932).—NaCN, guanidine chloride and acetylcholine exert a more powerful action on the isolated heart of the frog when the $p_H$ of the medium is lower. This is probably due to an increase in the cellular permeability. P. F. METILDI

**The effect of insulin at low and high altitudes.** FILIPPO MADON. *Arch. sci. biol* (Italy) **17**, 41–7(1932).—Blood-sugar detns. on 5 healthy subjects before and after injection of 10 units of insulin showed that when these subjects had been at an altitude of 3000 m. for 2 weeks their fasting blood sugar was higher and the lowering of the sugar was greater with the same dose. However, the min. values reached were the same for low and high altitude. P. F. METILDI

**The physiological inactivity of adrenaline chloride administered through the gastro-**

**intestinal tract in the dog.** CAMILLO COLOMBI AND ULRICO LANDI. *Arch. sci. biol.* (Italy) **17**, 113–25(1932).—In a new method of study, adrenaline chloride was found to be inactive on the gastrointestinal tract when administered *per os* or when given in the duodenum. It also did not affect isolated pieces of intestine or the arterial pressure. In man, also, adrenaline given by mouth has no effect. P. F. METILDI

**The action of the decidua and its extracts on the growth of larvae and the metamorphosis of Bufo vulgaris.** RENATO DE NUNNO. *Arch. fisiol.* **31**, 139–64(1932).—Bodily resistance and growth are increased. A. E. MEYER

**The action of chloralose on the cortical elements of the sigmoid zone of the dog.** G. MARTINO. *Arch. fisiol.* **31**, 186–99(1932).—Direct application of a 1% soln. of chloralose increases the excitability. By combined action with strychnine, clonic spasms of the muscles and epilepsy-like attack were produced. Subdural injections of 1.5 to 2 cc. of a 1% soln. did not cause visible symptoms. A. E. MEYER

**Diuresis. I. Diuresis after intravenous injections of hypertonic solutions of sodium chloride.** GIORGIO RAVASINI. *Arch. fisiol.* **31**, 219–26(1932); cf. *C. A.* **27**, 341, 1052.—The quantity of urine eliminated is greater than the vol. of soln. injected, whereas the NaCl is not completely eliminated. **II. Diuresis after intravenous injections of isotonic sodium chloride solution.** *Ibid* 286–93.—NaCl and $H_2O$ are eliminated at the same rate, as injected. **III. Diuresis after injection of hypotonic sodium chloride solution.** *Ibid* 294–309.—The urine vol. is less than that of the liquid injected and decreases as the hypotony increases. The NaCl eliminated exceeds the injected quantity. **IV. Diuresis after intravenous injection of distilled water.** *Ibid* 310–19.—The urine vol. is less than that of the $H_2O$ injected. The NaCl in the urine decreases inversely with the rate of injection. A high rate causes death. A. E. MEYER

**Bismuth-kaolin mixtures in the treatment of gastrointestinal disturbances.** GEORGES HAYEM. *Bull. acad. méd.* **106**, 224–5(1931).—A mixt. of 1 part $BiONO_3$ with 3 parts kaolin is as effective as the pure Bi salt. A. E. MEYER

**Three cases of intestinal parasites healed by pyrethrins.** M. ANGLADE AND O. GAUDIN. *Bull. sci. pharmacol.* **39**, 480–3(1932); cf. *C. A.* **26**, 2246.—Treatment with pyrethrins destroyed *Oxyuris* very rapidly. A. E. MEYER

**Sensitiveness to medicines.** EDOUARD JOLTRAIN. *Rev. méd.* **48**, 267–86(1931). A. E. MEYER

**Usefulness of insulin in conditions other than diabetes.** PIERRE SÉE. *Rev. méd.* **48**, 320–40(1931). A. E. MEYER

**The excitability of the vegetative nervous system and sodium perchlorate.** GERONIMO SPAGNOL. *Rev. sud-americana endocrinol. inmunol. quimioterap.* **16**, 1–13(1933).—Injections of $NaClO_4$ in animals cause a depression of the parasympathetic-vagal system; high doses produce complete paralysis. The sympathetic system shows hyperexcitability with excessive sensitiveness to adrenaline. It is supposed that the $NaClO_4$ causes a decrease of the K ions in the blood with consequent change of the Ca:K ratio. A. E. MEYER

**The neutralizing effect of calcium in tuberculosis treatment.** LUCAS F. DEFELICE. *Semana méd.* (Buenos Aires) **1932**, II, 1055–62.—Ca is important for neutralization of the increased acidity in tuberculosis, which must precede the recalcification of the lesions. A. E. MEYER

**The influence of monobromoacetate on the carbohydrate metabolism and the anaerobic disappearance of lactic acid.** WALTER HAARMANN. *Biochem. Z.* **256**, 326–49(1932).—Monobromoacetate inhibits the lactic acid production from carbohydrate in tissues, and furthermore lactic acid when added disappears anaerobically. A similar disappearance of lactic acid under anaerobic conditions is observed in brain tissue even without the addn. of monobromoacetate. The anaerobic lactic acid disappearance was on the av. 81 mg. % in skeletal muscles, but with the addn. of lactate this rose to 218 mg. %. The sensitivity to the monobromoacetate varies greatly, the lactic acid formation from preformed carbohydrate being prevented in the tissues by a concn. of 1:4000–1:250; from glycogen by a concn. of 1:1000–1:250; while the inhibition of lactic acid formation from hexose diphosphate is incomplete. Methylglyoxalase is not affected by the monobromacetate poisoning, nor is the reduction of pyruvic to lactic acid seriously disturbed. The addn. of succinic, fumaric, maleic, glycerophosphoric and propionic acids in the presence of monobromoacetate causes a larger lactic acid production than without the addn. While monobromoacetate completely suppresses the destruction of glucose, the hydrolysis of glycogen is unaffected. A concn. of monobromoacetate sufficient to inhibit completely the lactic acid formation has little effect on the hydrolysis of P from hexosediphosphate, hexosemonophosphate or glycerophosphate. Rabbits may be killed by a dose of monobromoacetate which does not yet reveal any influence upon the muscles or brain metabolism, but the lactic acid formation by liver and kidney is completely inhibited. S. MORGULIS

**Influence of phosphate on tissue respiration.** BRUNO KISCH. *Biochem. Z.* **257**, 95–112(1933); cf. *C. A.* **27**, 137.—The respiration of a ganglion-rich nerve tissue (retina) is definitely raised by the addn. of *M*/15–*M*/60 phosphate which also prevents the fall in respiration usually found in long-continued expts. On the contrary, kidney tissue has a higher respiratory activity in phosphate-free than in phosphate-contg. Ringer soln. S. MORGULIS

**Action of methylene blue on cell respiration.** WALTER FLEISCHMANN AND SUSANNE KANN. *Biochem. Z.* **257**, 293–300(1933).—The respiration of the retina is greatly increased *in vitro* by methylene blue. Levulose-phosphate soln. acts as a model of a double respiration system, a KCN-sensitive heavy metal catalysis and a KCN-insensitive transfer of O by a pigment which carries O through its ability to become spontaneously dehydrated. If this system is poisoned by KCN, the O consumption in air is again increased by the addn. of methylene blue. The oxidation of levulose in neutral phosphate soln. in the presence of methylene blue resembles that of the respiration of the living aerobic cell, and it stimulates only the chief respiration or the Fe respiration, acting vicariously for the injured portion of the oxidation system. S. MORGULIS

**Comment on Wilson and Strieck's article: Influence of intravenous injection of diastase on the blood sugar of normal and depancreatized animals.** G. MANSFELD. *Biochem. Z.* **257**, 333(1933); cf. *C. A.* **26**, 5663.—Polemical. S. MORGULIS

**Effect of reduced atmospheric pressure on the glutathione content of the liver.** SIEGRIED LAURENS MALOWAN. *Biochem. Z.* **257**, 437–41(1933).—The glutathione contents of the liver of rats and of guinea pigs kept under reduced pressure increases, unless there is a fatty transformation, in which case the glutathione content decreases Glutathione content was found to increase as a result of operative shock or illness. S. MORGULIS

**Does insulin affect the thyroid gland? II.** C. E. RÄIHÄ AND U. UOTILA. *Skand Arch. Physiol.* **86**, 287–90(1933); cf. *C. A.* **23**, 5497.—Chronic overdosing with insulin produces thyroid hyperfunction. S. MORGULIS

**The effect of viosterol on the periosteum in experimental fractures.** ROBERT C GRAUER. *Arch. Surg.* **25**, 1035–54(1932).—Viosterol in therapeutic doses stimulates the osteogenic layer and enhances osteogenic differentiation, this favoring repair Overdosage stimulates the fibrous layer of the periosteum through decalcification of bone and retards repair. Studies of the serum Ca and P indicate that the Ca:P ratio has no prognostic value. JOHN T. MYERS

**The action of the toxins of the gas gangrene group of organisms on the horny layer of the skin of the rabbit.** E. GILDEMEISTER AND H. SCHLOSSBERGER. *Zentr. Bakt Parasitenk. I Abt.* **126**, 527–9(1932).—The toxins of *Cl. histolyticum* and *Cl. oedematiens* have a component which causes necrosis of the skin of rabbits: *Cl. chauvei*, *Vibrio septicus* and Fränkel's gas bacillus do not have it. JOHN T. MYERS

**The pharmacologic action of narcotine, its derivatives and the following mixtures: narcotine or its derivatives with morphine; narcotine with hyoscyamine; morphine with hyoscyamine.** MASAKATSU HAYASHI. *Japan. J. Med. Sci. IV. Pharmacol.* **6**, 203–57 (1932).—Narcotine (I) and the following derivs. were studied: the HCl salt (II) of 1 meconyl-2-methyl-6,7-dihydroxy-8-methoxy-1,2,3,4-tetrahydroisoquinoline (phenol base from I), diacetyl deriv. (III) of II and di-Et ether (IV) of II. I, II, III and IV at first have a paralytic action on frogs, but spinal reflexes are increased, leading to a strychnine-like tetanus. On frogs, III is strongest, I weakest. In mice and dogs small doses are quieting, while larger doses produce tetanus. The sedative action is greatest for I, least for III, and the convulsions are greatest with I, least with III. Hyoscyamine (V) increases the effect of morphine (VI) but hardly affects that of I. In small amts. I, II, III and IV have no effect on respiration, while larger amts. depress the respiration These substances are weakly antagonistic to VI in its effect on respiration. V decreases the respiratory rate of dogs previously given VI but increases the respiratory rate of dogs previously given I. I, II, III and IV lower the blood pressure slightly, probably as a result of a direct heart action. Injection of I produces a strong contraction of the ear vessels of the dog. II produces a weak contraction and III a slight dilation. Small amts. increase the tonus and contractions of the intestine. I and IV have a marked action, III less action and II almost none. The actions of I, II, III and IV are synergized by VI. These compds. have a similar but weaker action on the uterus. The following min. lethal doses (in g. per kg. of body wt.) are given for injection into the lymph sac of frogs, subcutaneous injection in mice, intravenous injection in mice and intravenous injection in dogs, resp.: I, 1.0, 2.0, 0.15, 0.06; II, 1.0, 1.5–2.0, 0.4, 0.2; III, 0.7, 1.5, 0.3–0.4, 0.15. T. H. RIDER

**The pharmacological action of plumbagin.** KEIEN KO. *Japan. J. Med. Sci. IV Pharmacol.* **6**, 259–86(1932).—Newly collected roots of wild *Plumbago ceylanica* were finely cut, dried and extd. with $Et_2O$. The $Et_2O$ was evapd., and the residue dissolved in

alc. and poured into water. The ppt. was recrystd. from $Et_2O$, then from petroleum ether, this yielding 4% of *plumbagin* ($C_{11}H_8O_3$) (I), volatile yellow crystals, m. 67°, subliming 90°, sol. alc., $Et_2O$, boiling water, sol. cold water to 0.0195%. I produces excitement of the central nervous system of frogs, mice and rabbits, larger doses producing convulsions followed by paralysis. The m. l. d. is 0.5 mg. per g. for frogs, 0.1 mg. per g. for mice and 10 mg. per kg. for rabbits. In rabbits I produces slight depression of respiration and blood pressure, the latter action being due to dilation of peripheral vessels and direct heart action. I paralyzes isolated frog heart muscle and causes dilation of perfused blood vessels, causes initial excitement and subsequent paralysis in isolated smooth muscle organs, paralyzes both peripheral motor nerves and muscular tissue of frogs, and has no diuretic action in rabbits. T. H. RIDER

**The treatment of congenital syphilis with bismuth arsphenaminesulfonate [bismarsen].** THOMAS M. MARKS. *J. Chemotherapy* **9**, 78–9(1933).—One case report. T. H. RIDER

**The pharmacological action of eseridine.** REGINALD ST. A. HEATHCOTE. *J. Pharmacol.* **46**, 375–85(1932).—The m. l. d. of eseridine (I) is 10 times as large as that of physostigmine (II). I possesses actions similar to II but only $^1/_{10}$ as strong. T. H. R.

**The relative preanesthetic values of the sodium salts of isoamylethylbarbituric acid [amytal], pentobarbital, phenobarbital and barbital.** ED. E. SWANSON. *J. Pharmacol.* **46**, 389–94(1932).—Na amytal and Na pentobarbital have practically the same premedication value, Na phenobarbital and Na barbital having lower efficiencies. T. H. RIDER

**Synergism and antagonism of drugs. I. The non-parasympathetic antagonism between atropine and the miotic alkaloids.** THEODORE KOPPANYE. *J. Pharmacol.* **46**, 395–405(1932).—The antagonism between atropine and the pilocarpine-physostigmine group is not limited to the parasympathetic endings. A physicochemical antagonism must be considered. T. H. RIDER

**Vagus control of pancreatic function. Experimental insulin resistance.** EPHRAIM B. BOLDYREFF AND JEAN F. STEWART. *J. Pharmacol.* **46**, 407–18(1932).—Crystalline insulin (I) produces a monophasic hypoglucemic effect on a wide variety of vertebrate and cold-blooded animals. I has strong vagotonic properties. Vagus blockage renders the subjects unreactive to I. T. H. RIDER

**Gastric secretion caused by insulin.** EPHRAIM B. BOLDYREFF AND JEAN F. STEWART. *J. Pharmacol.* **46**, 419–29(1932).—Insulin (I) has a monophasic secretagog action on gastric glands. Gastric juice secreted in response to I has a high acidity and a high pepsin content. This secretory action of I is suppressed by atropine and is probably due to vagus stimulation of the stomach. T. H. RIDER

**Basic sodium phosphate as an antidote for hypercalcemia in dogs.** IRVINE H. PAGE AND JASPER P. SCOTT. *J. Pharmacol.* **46**, 431–4(1932).—Intravenous injection of basic Na phosphate lowers serum Ca of normal dogs and those having a hypercalcemia produced by parathyroid ext. T. H. RIDER

**The response of the isolated intestine to cocaine and procaine at different $p_H$ levels.** WM. SALANT AND WM M. PARKINS. *J. Pharmacol.* **46**, 435–46(1932).—Cat intestine was stimulated by cocaine (I) below $p_H$ 7.0. At a $p_H$ of 7.7–7.8 I produced mainly depression, sometimes preceded by stimulation. At a $p_H$ of 8.5 stimulation predominated. Stimulation of rabbit intestine was rare but was the rule with rat intestine at all $p_H$ levels. Procaine action on the rat intestine was not influenced by changes in $p_H$. T. H. RIDER

**Cardiovascular and metabolic reactions of man to the intramuscular injection of posterior pituitary liquid [pituitrin], pitressin and pitocin.** ARTHUR GROLLMAN AND E. M. K. GEILING. *J. Pharmacol.* **46**, 447–60(1932).—Pituitrin and pitressin produce a brief fall in pulse rate, O consumption and cardiac output, followed by a prolonged rise in these functions. Pitocin produces a slight increase in O consumption and negligible changes in the circulation. The marked pressor effects of pituitary exts. observed in anesthetized animals is not observed in the normal man following therapeutic doses. T. H. RIDER

**The action of various uric acid eliminants upon experimental uric acid storage in the kidney.** HERMANN O. SCHROEDER. *J. Pharmacol.* **46**, 461–9(1932); cf. *C. A.* **27**, 777.—Only cinchophen and neocinchophen show a marked influence in preventing uric acid deposition. Na salicylate increases uric acid excretion very slightly, but apparently because of an effect on nuclear metabolism rather than because of a renal function. Although Na salicylate increases uric acid excretion in gout even more than does cinchophen, it provokes attacks by increasing uric acid formation. T. H. RIDER

**The toxic properties of hydrogen sulfide.** ETIENNE AUDIBERT AND LOUIS DELMAS. *Ann. mines* [13], **2**, 203–13(1933).—The toxic effects of $H_2S$ on various animals were studied. Five parts per 100,000 caused the appearance of toxic symptoms after exposure

for several hrs. One part per thousand caused acute intoxication and death. Artificial respiration with the inhalation of O was the most effective method of resuscitation. Toxic quantities of $H_2S$ can be detected by the coloration of a tube contg. $I_2O_5$ and fuming $H_2SO_4$. E. W. Scott

**The physiological action of nitrogen peroxide.** Etienne Audibert and Louis Delmas. *Ann. mines* [13], **2**, 214–15(1933).—The analogy between the effects of $NO_2$ and $H_2S$ when present in toxic quantities in the air is pointed out. E. W. Scott

**Experimental study of the effects of potassium dichromate on the monkey kidney.** Warren C. Hunter and Joe M. Roberts. *Am. J. Path.* **9**, 133–47(1933).—Subcutaneous injections of $K_2Cr_2O_7$ affected the proximal and distal convoluted tubules and glomeruli of the kidney similarly to U nitrate or $HgCl_2$. It is locally corrosive, and following repeated injections there occurs a regeneration of tubular epithelium of distinctly atypical morphology. This epithelium is resistant to further injury by the dichromate. F. B. Seibert

**Humoral transmission of chorda tympani effect.** B. P. Babkin, Armine Alley and George W. Stavraky. *Trans. Roy. Soc. Can.* V, **26**, 89–107(1932).—In cats after a small dose of physostigmine, stimulation of the chorda tympani nerve on one side is followed by secretion and acceleration of the blood flow of the submaxillary gland on the other side: it also lowers the systemic blood pressure. After 1 mg. of atropine sulfate, no effect could be demonstrated. All possible reflex influences were excluded. The phenomenon could be abolished or decreased by clamping the vein of the stimulated gland. It was concluded that a special chem. substance was formed in the submaxillary gland, preserved from inactivation by physostigmine and transferred in the blood stream causing secretion and vasodilitation in the opposite gland, and a fall in systemic blood pressure. Louis J. Soffer

**A preliminary report on the effect of choline on fat deposition in species other than the white rat.** C. H. Best, M. Elinor Huntsman and O. M. Solandt. *Trans. Roy Soc. Can.* V, **26**, 175–6(1932).—When added to a high fat diet in 20-mg. daily dosages choline inhibits the deposition of fat in the liver in white mice; preliminary studies suggest that similar results may be obtained in chickens and young dogs. L. J. S.

**The oral administration of insulin derivatives.** D. A. Scott, A. F. Charles and E. T. Waters. *Trans. Roy. Soc. Can.*, V, **26**, 287–93(1932).—Tests were made with insulin inactivated by acid alc., by $Ac_2O$, by MeI, by 0.1 *N* HCl and with cryst. insulin on a normal and a depancreatized dog. The derivs. showed little activity when injected subcutaneously, but a considerable part of the potency was recoverable on treatment with alkali. Significant lowering of blood sugar did not occur. Louis J. Soffer

**Pharmacological investigation of blood vessels of the human placenta.** K. Ueda *Japan. J. Obstet. Gynecol.* **15**, 264–83(1932).—Adrenaline and pilocarpine did not cause any reaction in the blood vessels of placentas of less than the 5th month of pregnancy, but the former caused a peculiar contraction in the blood vessels of 6-month placentas, while the latter caused a dilatation. Atropine did not cause any definite action in any stage of pregnancy, but $BaCl_2$ brought a marked contraction as early as the 4th month Effects of blood $CO_2$ and serum, of $p_H$, of Ca, K and Na ions upon the blood vessels of human placenta were also investigated. K. Sugiura

**Diuretic properties of watermelon juice.** A. Richard Bliss, Jr., Robert W Morrison and Ellsworth O. Prather, Jr. *J. Tennessee Acad. Sci.* **8**, 92–3; *Am. J Pharm.* **105**, 53–8(1933).—Given to rabbits kept on controlled diet, watermelon juice failed to cause diuresis. Concd. juice caused gastrointestinal irritation. A. L. T

**Variability of the effects of sparteine on the intestine in situ.** Raymond-Hamet *Compt. rend.* **196**, 131–4(1933).—Intravenous injection of 10 mg. sparteine per kg. body wt. into dogs may either reduce the intestinal tonus at once or cause a preliminary stimulation, followed by a reduction in tonus. The latter, which occurs with only a few individuals, distinguishes the action of sparteine from that of nicotine and related alkaloids. The use of sparteine in intestinal troubles of nervous origin is suggested. K. V. Thimann

**The action of tyramine on the excitability of the cardiac-pneumogastric nerve and the influence of this amine on the effects of nicotine.** Raymond-Hamet. *Compt. rend* **195**, 1330–3(1932).—Tyramine, injected intravenously into dogs in doses ranging from 20 to 200 mg. per kg., depresses or totally abolishes the excitability of the vagus and diminishes the vasomotor and intestinal effects of nicotine (1 mg. per kg.). R. P. Walton

**A British investigation.** Esther M. Killick. *Gas J.* **201**, 262(1933).—In preliminary expts. to det. whether man can develop a tolerance toward CO, a man and a woman inhaled air contg. CO at weekly intervals. The concn. of CO could be increased in successive expts. without the appearance of addnl. symptoms of poisoning, and the amt. of CO in the blood failed to increase proportionally with the increased concns. of CO in the air. P. J. Wilson, Jr.

**Oxidation-reduction of cells and tissues.** K. Okamoto. *Japan. Z. Mikrobiol. Path.* **26**, 1135–73(1932).—The oxidation-reduction by triphenylmethanesulfonic acid dyes was investigated for cells and tissues, with both supravital and vital staining, which show metachromasia *in vivo* and *in vitro* when oxidized and reduced. Histiocytes, stellate cells in the liver, sinus endothelium of the lymph gland and spleen, interstitial cells of the testis, liver cells, etc., have strong oxidizing power. Cartilage cells, convoluted tubular epithelium of the kidney and connective tissues, namely, the elastic fibers and collagen fibers, have strong reducing power, and the ovarian epithelium has weak reducing power. I. S. Yun

**Effect of thiocyanate on artificially cultivated tissues, especially on the spleen tissue of the chicken embryo.** G. Kobayashi. *Japan. Z. Mikrobiol. Path.* **26**, 1752–60 (1932).—The inhibiting action of thiocyanate on spleen tissue *in vitro* was accelerated in media contg. also neutral salts or acids. I. S. Yun

**Peristalsis of the rabbit intestine during inhalation of anesthetics.** M. K. Mun. *Korean Med. J.* **2**, 93–106(1932); cf. *C. A.* **26**, 5664.—Peristalsis of the rabbit intestine diminished during inhalation of ether or $CHCl_3$. I. S. Yun

**Relation between rocambole extract from garlic and endocrine organs.** I. S. Yun. *Korean Med. J.* **2**, 112–13(1932).—Koreans use garlic freely in their cooking. Daily intravenous injections of rocambole ext. caused marked histological changes in the hypophysis, spleen, testis and especially in the thyroid gland of rabbits. Hyperfunction of the thyroid followed injections over a short period, and hypofunction followed injections continued for a long period. I. S. Yun

**Phagocytic function of the histiocytes. Influence of injection of non-specific protein on the phagocytic function of the histiocytes.** Takeo Takikawa. *Trans. Japan Path. Soc.* **21**, 228–31(1931).—The phagocytic action of histiocytes on India ink in rabbits was accelerated by the injection of non-specific protein, namely, caseosan. I. S. Yun

**Nature of the spirocheticidal property of arsphenamine.** Yuzo Muro. *Trans. Japan. Path. Soc.* **21**, 476–80(1931).—Arsphenamine injected intravenously into the rabbit passes through the liver to the intestine with bile and is absorbed from the intestinal wall to be later excreted through the kidney. Arsphenamine which after absorption from the intestine is present in blood has a stronger spirocheticidal power. I. S. Yun

**Experimental strychnine myocarditis in the rabbit.** Toiti Wakayama. *Trans. Japan. Path. Soc.* **21**, 517–20(1931).—Interstitial myocarditis resulted from the continuous injection of strychnine into rabbits. I. S. Yun

**The effect on the blood of injections of iodine ferratose.** Takashi Iishima. *Trans. Japan. Path Soc.* **21**, 535–6(1931).—Anemia appeared in partially hepatectomized rabbits after the intravenous injection of iodine ferratose. Hemorrhage and necrosis were found in bone marrow. I. S. Yun

**Tyramine anemia.** Toku Iwao. *Trans. Japan. Path. Soc.* **21**, 537–9(1931).—Anemia was found in the guinea pig after repeated injections of large doses of tyramine. Hemorrhage and iron infiltration were noted in liver tissue. I. S. Yun

**Changes in the brain brought about by experimental intoxication with coal gas. I.** Saburo Oba. *Trans. Japan. Path. Soc.* **21**, 639–47(1931).—Lipoids appeared in glia cells and ganglion cells as a result of coal-gas intoxication. Also fat granules appeared in the endothelium of the walls of small blood vessels. Severe poisoning causes fatty degeneration of glia cells and ganglion cells and hemorrhage in brain tissue. I. S. Yun

**Histopathological studies after so-called amyostatic poisoning. I. Experimental 3-astyl[3-aminohydrocarbostyrilhydrochloride], procaine and aconine intoxications in rabbits.** Iwao Wake. *Trans. Japan. Path. Soc.* **21**, 622–32(1931).—The 3-astyl causes neutrotropically regressive and degenerative changes in the central nervous system, especially in the substantia nigra, pallidum and in the cerebellum, and it causes passive hyperemia and regressive and degenerative changes in liver tissue. Procaine causes similar changes in the central nervous system but very slight changes in the liver. Aconine also causes similar changes in the central nervous system and peritoneal hemosiderosis in liver tissue. I. S. Yun

**Changes in muscle tissue due to adrenaline.** Kenziro Inoue. *Trans. Japan. Path. Soc.* **21**, 676–7(1931).—Large doses of 0.1% adrenaline soln. were injected intravenously into rabbits and heart muscle, smooth muscle and striated muscle examd. after 2 days, 7 days and 2 weeks, resp Degenerative changes appeared. I. maintains that the well-known arteriosclerosis following adrenaline injection is only a local evidence of changes found in all muscle tissues after adrenaline treatment. I. S. Yun

**Changes in striated muscles caused by globe-fish toxin.** Magoiti Hasiguti. *Trans. Japan. Path. Soc.* **21**, 678–9(1931).—Intravenous injection into rabbits of 0.003–

0.005 g. tetrodotoxin from the globefish caused slight degenerations of various kinds in striated muscle fibers and also hyperplasia of nuclei. I. S. YUN

**Relation between chemical salts and tumor growth.** RYOICHI JINGUU. *Trans. Japan. Path. Soc.* **21**, 743–7(1931).—Rabbit sarcoma was used and the size of the tumor was measured after intravenous injection of NaCl, $MgCl_2$, $CaCl_2$, $LiCl_2$ and KCl. Tumor growth is accelerated by Mg salts and inhibited by Ca salts. The salts which increase the content of blood sugar accelerate the development of tumor tissue, and those which decrease blood sugar inhibit the development. I. S. YUN

The essential oil of Pteronia Stricta Ait. (SMITH, SAPIRO) **17.** The chemistry of *Rauwolfia natalensis* (RINDL, GROENEWOUD) **17.** Organomagnesium compounds containing solubilizing amino groups (GILMAN, *et al.*) **10.** Preparation of agents to be used against malaria (RAY, *et al.*) **10.** Ethylene-*N*,*N'*-bisbarbital, a dimolecular barbital with hypnotic properties (DOX) **10.**

MINZ, B.: **Pharmakologie des Histamins und des Acetylcholins.** Berlin: Junk. 11 pp. M. 1.50.

SCHMID: **Contribution à l'étude pharmacodynamique du novarsénobenzol.** Paris: A. Legrand. 84 pp. F. 8.

ZUNZ, EDGARD: **Eléments de pharmacodynamie spéciale.** Étude de l'action des divers médicaments. Paris: Masson & Cie. 2 vols 1271 pp. F. 190.

## I—ZOÖLOGY

R. A. GORTNER

**Relation between the pigmentation of the skin of guinea pigs and their resistance to tetanic intoxication.** E. LEMÉTAYER. *Compt. rend. soc. biol.* **112**, 354–5(1933). Colored guinea pigs are more resistant to tetanus toxin than albinos. L. E. GILSON

**An ecological study of the fishes of the Hocking River 1931-1932.** P. SHERIDAN SHURRAGER. *Ohio State Univ. Biol. Survey Bull.* **28**, 377–409(1932).—The normal $p_H$ of the river is 7.6. Deviations from this are due to mine and mfg. wastes. The combination of sewage pollution and the decrease of O to 4.1 p. p. m. in the Lancaster region prevented fish life there. A gypsum plant was not observed to have any effect upon fish life in the river. Mine wastes give a condition of low $p_H$, increased $CO_2$ and suspended particles of S compds. The low $p_H$ was not the primary lethal factor but may have been a contributing factor during the period of greatest pollution. The $CO_2$ was probably not the lethal factor. The accumulation of suspended S compds. may produce asphyxiation and also chem. destruction of the gill tissue. A limestone filter is suggested for preventing the mine waste devastations. H. W. LEAHY

**The variation in the concentration of the hemolymph of terrestrial mollusks.** A. ARVANITAKI AND H. CARDOT. *J. Physiol. Path. Gen.* **30**, 577–92(1932).—The phys. properties of the hemolymph of 4 species of *Helix* were studied. Mineral substances play a preponderant role in detg. mol. concn. The higher the salt concn., the lower is the viscosity. L. A. MAYNARD

**Variations of the $p_H$ in the vacuoles of the Vorticella after induced contractions.** GIUSEPPINA PASTORI. *Arch. sci. biol.* (Italy) **17**, 164–8(1932). P. F. METILDI

**3,4-Dihydroxyphenylacetic acid, the pigment precursor of the wings of Tenebrio molitor L.** HANS SCHMALFUSS, ALFRED HEIDER AND KURT WINKELMANN. *Biochem. Z.* **257**, 188–93(1933).—It is definitely established that 3,4-dihydroxyphenylacetic acid is present in the wing of *Tenebrio molitor*, where it functions as the pigment precursor. S. MORGULIS

**Some physicochemical phenomena during regeneration. V. The lactic acid content of regenerated extremities of Axolotls.** N. OKUNEV. *Biochem. Z.* **257**, 242–4 (1933); cf. *C. A.* **27**, 1055.—The regenerated buds of tissue in axolotls deprived of their extremities contain about twice as much lactic acid as does the tissue of the old limb. This accumulation of lactic acid at the site of regeneration leads to the conclusion that cleavage metabolism is very active. S. MORGULIS

**Studies in animal aggregations: further studies on oxygen consumption and autotomy of the brittle star, Ophioderma.** W. C. ALLEE AND J. R. FOWLER. *J. Exptl Zoöl.* **64**, 33–50(1932); cf. *C. A.* **26**, 2796.—This is an extension of former work on the O consumption of grouped and isolated *O. brevispina*. Significant differences were found in the effect of aggregation formation upon O consumption during the breeding season as compared with similar data obtained outside this season. Grouped *Ophioderma* have physiol. characteristics like those shown by individuals isolated in containers with loosely heaped glass rods. C. H. RICHARDSON

**Food requirements of blowfly cultures used in the treatment of osteomyelitis.** J. G. HAUB AND D. F. MILLER. *J. Exptl. Zoöl.* **64**, 51–6(1932).—For the larvae of the

black blowfly (*Phormia regina*) lean beef was the most satisfactory food; for the adults, lean beef, sucrose and water. C. H. RICHARDSON

**The disappearance of the pigmentation of the eye and the skin of tadpoles [Rana sylvatica] that develop in solutions of indophenol dyes.** MARGARET REED LEWIS. *J. Exptl. Zoöl.* **64,** 57–69(1932).—Frog eggs which developed in tap water contg. phenol indophenol lacked the pigmented layer of the optic cup and showed defective skin pigmentation. This loss of pigment is not due to the destruction of the primitive pigment-forming material of the egg. C. H. RICHARDSON

**The nutrition of flesh-fly larvae, Lucilia sericata [Meig.]. I. The adequacy of sterile synthetic diets.** A. E. MICHELBACHER, W. M. HOSKINS AND W. B. HERMS. *J. Exptl. Zoöl.* **64,** 109–31(1932).—This fly develops normally in the absence of microorganisms on fish and concd. fish exts. Growth of the larvae is slow on common bacteriol. media, yeast, hen egg and several other foods. Purified casein, yeast, mineral salts, butter or cod-liver oil and cystine gave as rapid growth as natural contaminated flesh. The liquefying action of bacteria on solid food is often useful to the larvae; on foods that do not permit rapid growth bacteria are often harmful; on very poor foods they are always harmful to the larvae. The advantages of insects as test animals in nutritional work are indicated. C H. RICHARDSON

## 12—FOODS

F. C. BLANCK AND H. A. LEPPER

**Rate of heat penetration in certain heat-sterilized foods.** C. M. BURNS. *Food Tech.* **1,** 348–51, 400–2(1932).—The effect of size and shape of can, size of meat particles, influence of precooking, and presence of air and fat on the rate of heat penetration through tinned meat products has been studied. The presence of air accelerates heat penetration, and fat, particularly if it forms a surface layer, retards the process. Diffusivity consts., *i. e.*, thermal cond./(sp. heat × d.), have been detd. for meat in various conditions. B. C. A.

**Deterioration of the fat in foodstuffs.** W. L. DAVIES. *Food Tech.* **1,** 141–3, 181–3, 269–70(1931).—Fatty acid rancidity and oxidative rancidity are described, together with the effects of "pro-oxygens" and "anti-oxygens" on the period of induction. The influence of heavy metals and of microörganisms on oxidative rancidity and of various molds on ketonic rancidity is discussed. Other forms of fat deterioration, *e. g.*, "mustiness" and "fishiness," are considered, and methods for controlling the factors favoring oxidation are summarized. B. C. A.

**Estimation of higher saturated fatty acids in food fats.** J. GROSSFELD. *Allgem. Öl. Fett-Ztg.* **29,** 25–30, 92–6, 161–8, 220–9(1932).—A new technic is given for the detn. of higher satd. fatty acids (lauric acid and its higher homologs). The method is a modification of Bertram's in the following details: (*a*) The amt. of fat used is reduced to 500 mg. (*b*) The reaction time is reduced to 30 min. for fatty acids contg. lauric acid and 60 min. for others. (*c*) The oxidation is carried out at 20°. (*d*) Instead of shaking out the reaction mixt. with petr. ether, the fatty acids are sepd. by filtration in the presence of dil. alc. with subsequent extn. of the filter with petr. ether. (*e*) A new technic is given for the estn. of nonylic acid: After pptn. with $MgSO_4$ soln. a portion of the supernatant liquid is acidified with $H_3PO_4$ and distd. When half the liquid has been distd., the distillate contains 99.5% of the nonylic acid present. Lauric, myristic and palmitic acids are partially oxidized when exposed to alk. $KMnO_4$ soln. overnight. Lauric acid is affected most, while myristic acid is next and palmitic acid is only slightly affected. With fatty acids from apricot-seed oil, a 30-min. oxidation was found to be sufficient for the complete oxidation of the oleic acid present. When lauric, myristic, palmitic or stearic acids were added to fatty acids from apricot-seed oil, a 30-min. oxidation was not sufficient for the complete oxidation of the oleic acid present. A quant. sepn. of oleic acid and lauric acid is not possible with alk. $KMnO_4$ soln. With a mixt. of similar fatty acids, such as exists in coconut oil, a reaction time of 30 min. at 20° gives fairly accurate results for the detn. of the higher satd. fatty acids present. While being dried in a drying oven, lauric acid volatilizes to the extent of about 0.1% per hr. W. F. BOLLENS

**Detection of salicylic and benzoic acids present together in wines and foods in general.** G. GIBERTINI. *Boll. chim. farm.* **71,** 397–8(1932).—One hundred cc. of the wine, acidified with $H_2SO_4$, is shaken but not emulsified with 3 50-cc. portions of a light petroleum-$Et_2O$ mixt. (1:1), the exts., filtered if necessary, being mixed with 20 cc. of aq. $NH_3$ and the solvent expelled by gentle evapn. The aq. residue, which should be distinctly alk., is evapd. on a water-bath until the $NH_3$ is removed and the vol. reduced to a few cc. This is filtered through a wet filter and the filtrate tested

with a drop of dil. neutral $FeCl_3$ soln. A flesh-red ppt. shows BzOH, and a violet coloration salicylic acid. If the color reactions are disturbed in any way, the final liquid, either with or without the $FeCl_3$, should be again extd. with the solvent mixt., such extn. being repeated if the trouble reappears. Preserved vegetables, jams, etc., are pulped with $H_2O$, and the acidified aq. ext. is treated as above. B. C. A.

**Value of electrical methods for estimating the moisture content of wheat.** H. E. Hartig and B. Sullivan. *Ind. Eng. Chem., Anal. Ed.* **5**, 107–9(1933).—The capacity and resistance readings depend not only on the amt. of water present in wheat but also on whether sufficient time has elapsed to attain equil. after the addn. of water. Different varieties of wheat with the same moisture content may give different capacity and resistance readings. Three samples of the same kind of wheat contg. 3 different amts. of moisture may give identical readings of capacity or resistance. It is unlikely that any of the devices for detg. the moisture content of wheat by elec. means can give more than a rough approximation of the actual moisture content in the range and condition of greatest com. interest. F. L. Dunlap

**The character of the flour streams and their relation to commercial flours.** C. W. Brabender. *Mehlprobleme* **1**, 60–1(1932).—Curves drawn by the farinograph are given for the principal flour streams of a soft-wheat and a hard-wheat mill. The importance of detg. the character of the various streams with different wheat mixts. is emphasized. Curves are also given showing the effect of various conditioning temps. on the first-sizings stream. Clinton L. Brooke

**The gassing power of flour—its measurement and modification.** Gerhard Mueller. *Mehlprobleme* **1**, 67–9(1932).—The best baking results are obtained when optimum gluten development closely approaches or coincides with optimum gas production. The fermentograph and its use for measuring gas production are described, and various means of modifying the gassing power are suggested. C. L. B.

**The yellow coloration of certain flour extracts with alkali.** A. Schulerud. *Mühlenlab.* **3**, 13–18(1933).—From 5 to 10 g. flour is extd. with 100 cc. 50% EtOH for 15 min. in an ice-salt mixt., centrifuged, brought to room temp., and made alk. with 30% KOH. The depth of the resulting yellow color is detd. in a Duboscq colorimeter by comparison with a soln. of auramine (I) and eosin (II) (62 cc. of a soln. of 50 mg. I in 500 cc. $H_2O$ and 2.5 cc. of a soln. of 10 mg. II in 100 cc. $H_2O$ are mixed with 250 cc. concd. alc. and made up to 500 cc. with $H_2O$) and bears a close relation to ash content in both wheat and rye flour. Various modifications of the method are included. C. L. B.

**Table for the rapid identification of all baking faults.** Eugen Fritsch. *Mehlprobleme* **1**, 63–5(1932).—Dough and bread from fine and coarse wheat and rye flours, as well as mixed flours are included. Clinton L. Brooke

**What is dynamic swelling?** C. W. Brabender. *Mehlprobleme* **1**, 52–3(1932).—Flours which, after being doughed-up by hand or in a slow-speed mech. mixer, require addnl. water for the maintenance of the same consistency when given further mixing in a high-speed mixer, are said to exhibit dynamic swelling. The Brabender farinograph is used to study this phenomenon. Clinton L. Brooke

**Milk. II. Mineral constituents of goat milk.** Kinsuke Kondo and Shigeki Mori. *J. Chem. Soc. Japan* **53**, 1163–8(1932); cf. *C. A.* **25**, 5472.—The change in amts. of milk and mineral constituents during the lactation period was almost identical with the results found with cow milk. The change in amts. of K and Cl was directly proportional to the yield of milk, while the change of Ca and P was inversely related. Constancy of the colloid chem. properties of the milk throughout the lactation period is attributed to the regulation made by the change in amts. of Ca, P, K and Cl, etc. If the factor of Ca/P ratio alone is considered, the milk is a ricket-producing diet. **III. Iron, copper and zinc contents of milk.** *Ibid* 1190–6.—Fe, Cu and Zn contents of milks of cows and goats are given throughout the lactation period. Electrodialysis of milk indicated that approx. $1/2$ of the Fe was in lipoid form; $1/4$ was in ionizable salt and $1/4$ was in a complex form. K. Kitsuta

**Pasteurized *versus* raw milk.** H. A. Harding. *Illinois Med. J.* **62**, 374–8(1932); *U. S. Pub. Health Eng. Abstracts* **13**, Mi, 4(Feb. 18, 1933).—A general article pointing out the advantages of pasteurized milk. C. R. Fellers

**The E. coli content of raw and pasteurized milk.** A. J. Slack and C. W. Maddeford. *Can. Pub. Health J.* **23**, 574–8(1932).—Bacterial counts on agar and colon bacilli tests on raw and pasteurized milk are tabulated and discussed. The thermal death point of *E. coli* closely approaches the pasteurizing temp. (145°F.). The presence or absence of this organism is an index of the sanitary quality of milk: its absence, however, does not necessarily indicate that the milk has been pasteurized. The results indicate that milk contg. colon bacilli in 0.1 cc. has not been properly pasteurized or has been subsequently contaminated. It is not unreasonable to expect that amts. as large as 50 cc. be free from *E. coli*. R. E. Thompson

**The precipitation of milk proteins by means of trichloroacetic acid.** GEO. P. SANDERS. *J. Assoc. Official Agr. Chem.* **16**, 140–6(1933).—$CCl_3CO_2H$, when used in the ratio of 4 parts of 10% acid to 1 part of milk, is almost as effective as tungstic acid for pptg. N compds. in milk, and its use has the following advantages: (1) only 1 reagent is added to the milk instead of 2; (2) the casein particles are much coarser and filtration is much more rapid; (3) a larger quantity of filtrate is secured from a given quantity of mixt. Completeness of pptn. depends on the concn. of the acid in the milk-acid mixt.; most complete pptn. was obtained with 4 vol. of 10% acid to 1 vol. of milk. Possibility of using the method for detg. non-protein constituents of milk is suggested. A. PAPINEAU-COUTURE

**Detection and determination of sucrose in milk by means of phloroglucinol.** MASAO SHIMIZU AND YOSABURO IWASA. *J. Agr. Chem. Soc. Japan.* **8**, 1280–5(1932).—Sulfosalicylic acid (20% soln.) was added to milk to remove proteins. The filtrate was heated with HCl on the boiling-water bath for 10 min., and after cooling 10% phloroglucinol alc. soln. was added. In the presence of sucrose, a red color and a red ppt. were produced. The red ppt. is not produced by fructose, glucose or a mixt. of the two. By this method 0.02% of sucrose in milk and 0.001% in soln. can be detected. For detn. of sucrose 1 cc. of milk serum freed from protein was dild. till the soln. contained 0.01–0.002 g. of sucrose, and 5 cc. of the soln. was treated with sulfosalicylic acid and 0.75 cc. of HCl. After hydrolysis 2 drops of phloroglucinol soln. was added, the soln. was dild. with 5 cc. of alc., and the color compared with that of a standard. Y. K.

**Use of corn sugar in the manufacture of sweetened condensed skim milk.** R. J. RAMSEY, P. H. TRACY AND H. A. RUEHE. *J. Dairy Sci.* **16**, 17–32(1933); cf. *C. A.* **26**, 5154.—Bacteriol. analyses indicate that the types of spoilage organisms encountered in sweetened condensed skim milk are the same regardless of the kind of sugar used. At the same percentage compn. dextrose differs but slightly from sucrose in preserving power. Both sugars exert osmotic pressures much above the theoretical. Since, however, solns. of the 2 sugars having the same osmotic pressure were found not to have the same preserving power, factors other than osmotic pressure must be involved. Because of the lower soly. of dextrose only part of the sucrose can be replaced by dextrose. During storage for 3 months there was no crystn. in sweetened condensed skim milk prepd. with equal parts of the 2 sugars. Thickening during storage of the milk prepd. with dextrose as well as the formation of color during condensing was found to be caused by the formation of a protein-sugar or amino-acid-sugar compd. Discoloration occurs only when a reducing sugar is present. The color remains with the protein when it is sepd. from the milk. A small amt. of $CH_2O$ inhibits formation of the color. Slight alky. or an elevation in temp. greatly accelerates formation of the color. To avoid thickening and browning the dextrose should be added as a hot 65% sirup near the end of the condensing period. H. K. SALZBERG

**Determination of sucrose, lactose and invert sugar in sweetened condensed milk.** KINSUKE KONDO. *J. Chem. Soc. Japan* **53**, 1150–62(1932).—Exptl. error induced by disregarding the presence of invert sugar is great, since the com. cane sugar contains approx. 3% invert sugar. The following method gave the most accurate result for the estn. of sucrose, lactose and invert sugar: Weigh out a 15-g. sample and add 30 cc. warm water; stir well until it becomes homogeneous. Ppt. proteins and fat by addn. of 15 cc. Fehling's $CuSO_4$ soln. and 9 cc. 0.5 *N* NaOH. Filter and wash the ppt. by decantation, and make up the filtrate to 500 cc. (*D*). Take 47.5 cc. *D* and 2.5 cc. *N* HCl to make up to 50 cc. (*E*). Take 5 cc. *E*, invert the sucrose at 74° for 70 min. and est. the amts. of reduced Cu (*A* mg.) by Bertrand's method. Take 47.5 cc. *D* and make up to 50 cc. (*F*) with water. Take 10 cc. *F* and est. the reduced Cu (*B* mg.). Then $C = A - (B/2)(1 + 2.72/100)$, where *C* is mg. Cu reduced from inversion of sucrose, and 2.72/100 is the rate of increase of reduced Cu from the lactose during the inversion of sucrose. Find the amts. of invert sugar equiv. to *A* mg. Cu and calc. this to sucrose (*s* mg.). Invert sugar (*i* mg.) in 10 cc. *E* is calcd. by use of an equation, $i = 2s\ (2.9/100)$, where 2.9 is the av. amt. of *i* in 100 *s*. Find Cu (mg.) equiv. to *i*, and subtract this from *B* mg. which will give Cu (mg.) reduced by lactose (*l* mg.). The percentage of sucrose $= s \times 0.7227$, invert sugar $= i \times 0.4053$ and lactose $= l \times 0.3447$. K. KITSUTA

**Freezing and thawing of raw milk—effect upon the formation of cream layer.** F. B. BALDWIN, JR., AND W. B. COMBS. *Milk Plant Monthly* **22**, No. 2, 32–6(1933).—Partial freezing of milk did not affect its creaming ability. The manner in which the milk was thawed played the major role when decreases in the efficiency of creaming of partially frozen and thawed milk occurred. A. H. JOHNSON

**Whipping properties of cream as influenced by freezing and thawing.** F. B. BALDWIN, JR. AND W. B. COMBS. *Milk Plant Monthly* **22**, No. 1, 18–21(1933).—Partial freezing and thawing of raw cream prior to sepn. did not affect the whipping properties

of the resulting cream. Partial freezing and thawing of raw cream from 9.4–92.9% solid did not affect the whipping properties of the cream, while complete freezing and thawing destroyed its whipping properties. Pasteurization of cream contg. 30% of butter fat decreased the time required to whip cream. Partial freezing of cream did not alter the original cream emulsion, while total freezing did alter the original cream emulsion. A. H. JOHNSON

**Advantages of quick freezing and hardening.** S. F. SCISM. *Milk Plant Monthly* **22**, No. 2, 73–6(1933).—The shorter the freezing period, the better is the quality of the ice cream; smaller ice crystals improve body, texture and flavor. A. H. J.

**Viscosity studies of fluid cream.** J. H. NAIR AND D. E. MOOK. *J. Dairy Sci.* **16**, 1–9(1933).—A photograph and a drawing of an efflux type of viscometer are shown. The app. is adjustable to ordinary milk bottles. Results on 20% cream are reproducible to 0.5 sec. In pour tests the av. observer can distinguish between creams differing by 10 sec. in flow time. Flow time decreases with an increase in temp. and decrease in butter-fat content. Aging in the cold up to 96 hrs. is accompanied by a gradual increase in viscosity. Seasonal and territorial variations are also shown to exist. H. K. SALZBERG

**Substances adsorbed on the fat globules in cream and their relation to churning. II. The isolation and identification of adsorbed substances.** L. S. PALMER AND HILDA F. WIESE. *J. Dairy Sci.* **16**, 41–57(1933); cf. *C. A.* **26**, 6028.—Thoroughly washed cream was churned and the buttermilk centrifuged to give a soln. of the fat-stabilizing material, from which Ca was completely removed by dialysis. No Mg was found. The major part of the P was non-dialyzable. The protein fraction, obtained by acidification of the centrifuged and dialyzed buttermilk, was purified by dialysis and extn. with acetone, EtOH and ether. Yield before purification: 0.023–0.031% from 3.5% milk. Analysis for P, S and N showed it to be distinguishable from casein, lactalbumin, globulin and the alc.-sol. protein of milk. Nor is it identical to haptein (*C. A.* **19**, 2380). It readily yields a sol with $H_2O$, has an isoelec. point of 3.9–4.0 and cannot be coagulated with rennin or heat alone. The alc. exts. of the protein fraction yielded a mixt. of phospholipides (lecithin, cephalin and sphingomyelin) equal to 17–20% of the dry protein fraction. The protein-phospholipide ratio may be an important factor in the churnability of cream in industry. The fact that the protein-phospholipide membrane material is recovered in large proportion from the buttermilk prepd from thoroughly washed cream is advanced as proof that an inversion of phases does take place during some stage of the butter-making process, contradicting all theories of churning that assume a super-cream structure for butter, including the foam theory of Rahn (*C. A.* **16**, 2941). H. K. SALZBERG

**Improving body of pasteurized cream.** J. C. HENING AND A. C. DAHLBERG *Milk Plant Monthly* **22**, No. 1, 36–44(1933); cf. *C. A.* **27**, 347. A. H. JOHNSON

**Chondrus bleached with sulfur dioxide.** CHARLES H. LAWALL AND JOS. W. E HARRISSON. *J. Am. Pharm. Assoc.* **21**, 1146–53(1932).—The presence of $SO_2$ (about 1000 p. p. m.) in an ice cream thickener and stabilizer was claimed by the manufacturer to be due to the fact that "the sulfites found are a natural constituent of one of the ingredients in the same manner as benzoic acid is a natural constituent of cranberries." Each of the ingredients was tested for $SO_2$ by the official A. O. A. C. method; no $SO_2$ was found, except in *Chondrus* (carrageen or Irish moss) which contained several thousand p. p. m. Domestic unbleached and sun-bleached *Chondrus* of known origin contained no $SO_2$. Com. imported *Chondrus* contained 920–4080 p. p. m. $SO_2$, showing conclusively that the presence of $SO_2$ in the ice cream thickener was due to the use of S-bleached *Chondrus*. A. PAPINEAU-COUTURE

**Butter fat variations in cow milk.** J. W. G. MACEWAN AND G. A. LEDINGHAM *Sci. Agr.* **13**, 324–40(1933).—Day-to-day variations are so great and are so influenced by the individuality of the cows that early expts. conducted with single cows cannot claim much significance. The fat decreases during the first 4 months of lactation, and increases thereafter. The lowest herd test was in July and the highest in Feb. Age of the cow had little influence on fat content, with a slight tendency for lower levels during later life. The first milk withdrawn from the udder is the lowest in butter fat and the strippings are richest. The fat test may range from 1 to 10% in the successive portions of each milking. The percentage of solids-not-fat remain relatively const. in the milk of a given cow. The common cereal grains used as feed did not significantly alter the percentage of fat in the milk. Wet brewers' grains do not depress fat yield and tend only to lower the test percentage when the yield of milk is increased. Heavy or light feeding of sunflower silage did not affect the fat content of the milk. Frequent sampling is necessary for accuracy in official cow-testing. Composite samples should consist of daily aliquots. Reduced allowances of drinking water had the effect of slightly reducing milk and fat yield, but did not significantly alter the test. Increased

milk flow tends to lower the fat test and *vice versa*. The secretion of fat in the udder and the excretion of the non-fatty constituents may be independent processes.
C. R. FELLERS

**Relationship of acetylmethylcarbinol and biacetyl to butter cultures.** M. B. MICHAELIAN, R. S. FARMER AND B. W. HAMMER. Iowa Agr. Expt. Sta., *Research Bull.* **155**, 325–60(1933); cf. *C. A.* **26**, 4386.—Butter cultures with a satisfactory flavor and aroma contained considerable quantities of acetylmethylcarbinol and biacetyl, while cultures lacking in flavor and aroma contained either only small amts. or none. The carbinol is quantitatively much more important than the biacetyl. The citric acid-fermenting streptococci which are normally present in butter cultures produce these compds. The aroma and flavor increase during the cream ripening and storage of butter at low temps. Only a few strains of *S. lactis* produced the characteristic aroma and flavor in milk. The addn. of 0.03% citric acid, AcOH or AcH to milk produced increases in the characteristic flavor of acetylmethylcarbinol. The flavor and aroma were sometimes destroyed in butter cultures by various strains of *S. lactis*. This occurred most frequently at low acidities. Special flavor-producing butter cultures were prepd. with varying success.
C. R. FELLERS

**New relation for the determination of vegetable oils in butter.** OSCAR DE SONZA VIEIRA. *Rev. brasil. chim.* **2**, 237–46(1930).—The relation 100 (Polenske value)/xylene value should provide a delicate criterion of the presence of coconut oil in butter, since for pure butter the figure averages 10 and is as high as 1529 for a typical babassu fat.
B. C. A.

**Composition of illipé butter. On α,α-dilauro-β-azelain and α,α-dilaurin.** G. SCHUSTER. *J. pharm. chim.* **16**, 421–31(1932); cf. Hilditch, *C. A.* **24**, 3388.—Two samples gave these consts.: acid no. expressed as stearic acid, 4.63, 1.8%; ash 0.5, 0.3%; unsapond. 2.1, 2.4%; sapon. no. 199.7, 199.4; I no. 47.64, 46.82, resp. Examn. of oxidation products of illipé butter by $KMnO_4$ in acetone soln. showed this compn.: (*a*) completely satd. glycerides 6.78% (tristearin 1.4%, palmito-distearin 5.2%); (*b*) disatd. monounsatd. glycerides (in terms of oleic esters) 61.5% (dilauro-β-olein 21.3%; distearo-β-olein 40.2%); (*c*) monosatd. diunsatd glycerides (as oleic esters) 8.9% (β-monostearo-α,α-olein 5.4%; β-palmito-α,α-olein 3.5%); (*d*) triunsatd. glycerides (triolein) 12.22%. Synthetic new azelaic glycerides are: (*a*) *α,α-distearo-β-azelain*, m. 67°; (*b*) *β-stearo-α,α-diazelain*, m. 61°; (*c*) *β-palmito-α,α-diazelain*, m. 57°; (*d*) *α,α-distearo-β-palmitin*, m. 63° (cf. Amberger, *C. A.* **18**, 1346). The compd. α,α-dilauro-β-azelain can be partially sapond. forming α,α-dilaurine, m. 22–23°. S. W.

**Composition of cow butter. Laurobutyroazelain.** G. SCHUSTER. *J. pharm. chim.* **16**, 465–70(1932); cf. Hilditch, *C. A.* **23**, 1963; DeConno and Scopinaro, *C. A.* **23**, 3756, 5247, and preceding abstr.—Two samples of French butter gave the following consts.: $H_2O$ 8.5, 17.0; ash 0.5, 0.3; acidity as butyric acid 1.82, 1.52%; sapon. no. 230.1, 225.8; I no. 41.7, 39.3; volatile acids no., sol. 27.2, 27.5; insol. 2.4, 2.3; fatty acids no., sol. 5.5, 5.4; insol. 87.5, 87.8%. Upon oxidation with $KMnO_4$ in acetone soln. the following percentage compn. was obtained: completely satd. glycerides 35.80% (liquid 20.3%, solid 15% consisting of dipalmitomyristin 11% and distearomyristin 3%) and monoöleo-disatd. glycerides 61% (contg. distearoölein, 3% and laurobutyroölein, 57%). The oxidation product, laurobutyroazelain, gave no intermediate complex upon sapon.
S. WALDBOTT

**Vitamin-A content of naturally colored nut margarines.** CHARLES F. POE AND HAZEL A. FEHLMANN. *Ind. Eng. Chem.* **25**, 402–3(1933).—The vitamin-A content of a no. of naturally colored nut margarines is detd. The Sherman vitamin-A units per g. were calcd., the highest being 4.7. The amt. of vitamin A in these products is found to be low when compared with that in butter. The term vitamin A as used in this paper refers to vitamin A *per se* as well as to carotene, the precursor of this vitamin.
F. L. DUNLAP

**Development of the cheese industry. Influence of controlled lactic fermentation on the quality of cheeses.** P. MAZÉ, P. J. MAZÉ AND R. ANXIONNAZ. *Compt. rend. soc. biol.* **112**, 423–5(1933).—Discussion.
L. E. GILSON

**Paraffin *vs.* asphalt-base oils in maintaining egg grades in storage.** T. L. SWENSON, ROB R. SLOCUM AND LAWRENCE H. JAMES. *Ice and Refrigeration* **83**, 220–22(1932).—The function of mineral oils in egg preservation is to reduce respiration and evapn. through shell pores. After 9 months in storage all oiled eggs graded higher than unoiled. No difference was noted between oils of paraffin and those of asphalt base. Oils whose pour points were higher than the storage temp. were most effective.
ALICE W. EPPERSON

**A statistical treatment for establishing the accuracy of methods of interpreting analytical results with special reference to certain egg products.** F. A. VORHES, JR. *J. Assoc. Official Agr. Chem.* **16**, 113–27(1933).—A systematic method of interpretation

by comparison is presented, which is applicable to a restricted type of sample which has been difficult to interpret by the usual methods and which may be defined as a naturally occurring substance, separable into 2 parts, each part contg. the same chem. elements in different proportions. Formulas obtained by this method and applying to some egg products are presented, together with a method of estg. the max. error of the formulas and a measure of the accuracy of the formulas. An orthodox method of interpretation and its accuracy as applied to some egg products is given. Charts representing graphically the errors of the formulas given are presented, and the use of these charts is explained. A. PAPINEAU-COUTURE

**The effect of carbon dioxide on bacterial growth with special reference to the preservation of fish. II. Gas storage of fresh fish.** F. P. COYNE. *J. Soc. Chem. Ind.* **52**, 19–24T(1933); cf. *C. A.* **26**, 3308.—Various types of fish could be kept in $CO_2$ at 0° for periods up to 28 days without serious deterioration, while controls stored in air were inedible after 12–14 days. Similar results were obtained at 10°, with shorter storage periods. Air contg. 40% $CO_2$ was as satisfactory as pure $CO_2$. In most cases the fish stored 20 days in $CO_2$ at 0° was not in perfect state, but the economic value of $CO_2$ storage could be considerable, particularly for long-distance fishing trawlers. The effect is simply due to suppression of bacterial development. K. V. T.

**Why a seasonal quarantine is placed upon mussels and clams.** H. MULLER. Calif. State Dept. Pub. Health, *Weekly Bull.* **11**, 138–40(1932); *U. S. Pub. Health Eng. Abstracts* **13**, Mi, 1(Jan. 21, 1933); cf. *C. A.* **26**, 6022.—The toxicity of the shellfish varies from season to season and is highest during the summer months. The use of ¼ oz. of $NaHCO_3$ per qt. of water used for cooking destroys about 85% of the poison in 20–30 min. The toxin is confined principally to the intestines of the shellfish. Cooking alone without the use of $NaHCO_3$ does not inactivate the toxin. C. R. F.

**Copper contents of some foods.** G. HOWARD SATTERFIELD AND S. O. JONES. *J. Elisha Mitchell Sci. Soc.* **48**, 16(1932).—Foods raised in Franklin Co., N. C., contained Cu as follows: white potatoes 6.5, yellow potatoes 4.1, black grapes 8.1, navy beans 10.45, black-eyed peas 7.36, lima beans 8.6, white corn 5.95, yellow corn 16.6 and popcorn 6.6 mg. per kg. A. L. MEHRING

**The phosphatide content of apples, pears, plums and peaches.** BRUNO REWALD AND ALBERT SCHWIEGER. *Biochem. Z.* **257**, 289–92(1933).—The skin of these fruits contains 0.011–0.066% (plum, apple) and the meat 0.009–0.030% (apple, peach) The stones contain up to 0.41% phosphatide (plum). The highest total fat quantity in the fruit meat is 0.37% in the plum and the lowest, 0.11%, in the pear; in the skin the highest content of 1.57% is found in the peach and the lowest of 0.54% in the pear. S. MORGULIS

**Comparative mineral contents of Philippine bananas: calcium, iron, magnesium and phosphorus.** JULIAN R. MARTINEZ. *Philippine Agr.* **21**, 547–50(1933).—Ten varieties of Philippine bananas contain: ash 0.74–1.27, $H_2O$ 56–76, CaO 0.004–0.021, $Fe_2O_3$ 0.003–0.018, MgO 0.031–0.210 and $P_2O_5$ 0.109–0.294%. A. L. MEHRING

**The muslin tube fruit-juice filter.** R. B. HICKOK AND ROY E. MARSHALL. Mich. Agr. Expt. Sta., *Quart. Bull.* **15**, 191–7(1933).—A pectin-dissolving enzyme, such as Pectinol RA, is added to apple juice at the rate of 20–30 oz. per 100 gal. After 15 hrs the cider can be filtered with the aid of a filter-aid such as Hyflo, added at the rate of 2–4 lb. per 100 gal. The cider is brilliantly clear and retains all its fresh flavor. Cf. *C. A.* **27**, 348. C. R. FELLERS

**Analysis of the ash of apple fruits.** E. F. HOPKINS AND J. H. GOURLEY. Ohio Agr. Expt. Sta., *Bull.* **497** (*50th Annual Rept.*), 92–3(1932).—Ash of Grimes Golden variety contained P 5.36, Ca 3.38, K 44.92, Fe 0.074, Mn 0.019, Na 5.39 and Mg 2.88%. The fresh fruit contained 0.42% ash. McIntosh was low in ash, Ca and K, as well as low total solids in the flesh. Stayman Winesap had the highest percentage solids in the flesh. From July 9th to Aug. 13th, the solids increased from 15.3 to 19.4%, the ash decreased from 0.40 to 0.28, K from 0.17 to 0.12, P from 0.02 to 0.013 and Ca from 0.023 to 0.013. Apple trees under the same fertilizer treatment gave differences in K and P of the fruit of as much as 27%. C. R. FELLERS

**Corrosion of nickel and Monel metal by sulfured grape juice.** E. M. MRAK AND W. V. CRUESS. *Ind. Eng. Chem.* **25**, 367–9(1933).—These tests indicate that $H_2SO_3$ greatly increases the corrosive action of grape juice on Ni, but not on Monel metal. With Monel metal some constituent of red grape juice, possibly anthocyanin pigments, causes a greater corrosion by the juice than $H_2SO_3$. In most cases Monel metal proved more resistant than Ni to corrosion by the media used in these tests. F. L. D.

**Effect of acidity on the color of canned vegetables.** W. B. ADAM. *Food Tech.* **1**, 343–5(1932).—Attempts to fix natural color by canning peas at the optimum *p*H of 7.2–7.6 have been abandoned, as the good color is retained only for 4–5 months, the peas are soft, the tinplate blackens, and the lacquer is removed. B. C. A

**Quantitative analysis of lettuce ash.** LOUISE WENDT AND JOHN A. WILKINSON. *Proc. Iowa Acad. Sci.* **38**, 159–61(1931).—Three samples of lettuce, two of the varieties Big Boston and Grand Rapids grown at Ames, Iowa, and the third a head lettuce shipped from Salinar, California, gave the following results of analysis of the ash, resp.: K 26.60, 32.60, 35.00; Na 3.65, 1.95, 4.93; Ca 5.86, 5.16, 3.01; Mg 1.40, 1.60, 1.40; Fe 0.18, 0.18, 0.34; Al 0.54, 0.58, 0.185; Mn 0.28, 0.11, 0.11; Cu 0.022, 0.024, 0.049; Ti 0.009, 0.008, 0.016; Si 0.745, 0.515, 0.329; P 3.71, 4.07, 6.34; Cl 2.03, 2.93, 16.18; sulfate 3.23, 4.11, 3.44%; I less than 10 parts per million. References are included. W. G. GAESSLER

**Determination of amino acids and related compounds in honey.** R. E. LOTHROP AND S. I. GERTLER. *Ind. Eng. Chem., Anal. Ed.* **5**, 103–5(1933).—Because of the interference of reducing sugars, the ninhydrin test cannot be used for the detn. of amino acids and related compds. in honey. A method is proposed, based on pptn. with Neuberg's reagent (mercuric acetate and $Na_2CO_3$). The pptd. Hg amino compds. are sepd. and the free acids recovered by treating with $H_2S$. The ninhydrin test is then applied to the resulting soln. Small amts. of amino acid N are found present in every sample of honey examd. by this method, after removal of proteins and other colloidal material. F. L. DUNLAP

**The presence of *d*-gluconic acid in musty honey.** ANTONIO ANGELETTI. *Giorn. farm. chim.* **81**, 533–6(1932); cf. *C. A.* **26**, 3540.—The presence of *d*-gluconic acid in a sample of musty honey was proved by the sepn. and identification of the Ca salt. The mold responsible is probably *Penicillium crustaceum* (L.) Fries. L. W. B.

**Spoilage of maple products by molds.** CARL R. FELLERS. *J. Bact.* **25**, 67–8 (1933).—Mold-infected maple sugar often becomes moist or semi-liquid because of the action of invertase on a part of the sucrose. Molds, principally *Aspergillus*, frequently produce off flavors. JOHN T. MYERS

**The relative fatigue-recovery values of different carbohydrate blends and mixtures.** DONALD A. LAIRD. *J. Ind. Hyg.* **15**, 89–97(1933).—A crit. test of carbohydrate blends and mixts. to reveal their difference following ingestion in the quick recovery from physical fatigue. One prepn. was 70% maltose, the other only 20% maltose and 48% sucrose. While the carbohydrate content of both food prepns. was approximately the same, they differed in the one being predominatingly of the more readily absorbed and assimilated maltose. Five widely used tests of psycho-physical performance were used to measure fatigue effects. The tests reveal almost without exception the decided superiority of the maltose in hastening recovery of performance after phys. exertion. F. L. DUNLAP

**Identification of starches.** JAMES SCOTT. *Food Tech.* **2**, 125–8, 157–8(1933).—A brief illustrated description of the microscopic characteristics of wheat, barley, oat, potato, arrowroot, pea, bean, lentil, rice, maize, tapioca, sago, rye, pepper, chestnut, acorn, ginger and nutmeg starches. A. PAPINEAU-COUTURE

**Rapid method for determining amino acids and polypeptides in Nuoc-Mam.** J. C. PEIRIER AND NGUYEN-KIM-KINH. *Ann. fals.* **26**, 6–18(1933).—The following method is recommended: To 50 cc. of 96% alc. in a 50–55-cc. volumetric flask add 5 cc. Nuoc-Mam drop by drop, filter, neutralize a 5-cc. aliquot (= 0.456 cc. Nuoc-Mam on account of contraction, which is 0.22 cc. at 26°) with 0.1 *N* NaOH to the amphoteric point of sensitive litmus paper ($p_H$ 6.8), add 3 drops of 0.25% alc. soln. of thymolphthalein, titrate with 0.1 *N* NaOH with a microburet to a blue end point ($p_H$ 9.3); the titration (*A*) corresponds to all the carboxyls of the amino acids and polypeptides. To the same soln. immediately add 3 drops of a 0.25% alc. soln. of methyl red and titrate with 0.1 *N* HCl to a red end point ($p_H$ 5.5); the titration (*B*) corresponds to all the amino groups of the amino acids and polypeptides. To a 2nd 5-cc. aliquot of the filtered alc. soln. of Nuoc-Mam add 3.4 cc. freshly boiled distd. water and titrate with 0.1 *N* NaOH in the presence of phenolphthalein to faint pink ($p_H$ 8.3); if *C* is the titration, the titration (*D*) equiv. to the amino acids is given by $100(A - C)/71$. The figures actually obtained in the titrations should be corrected by means of blanks carried out on the same vol. of 96% alc. to which is added a vol. of water equal to the Nuoc-Mam used. With ordinary samples of Nuoc-Mam, the above procedure gives satisfactory decolorization permitting accurate titration; when the product has been colored with roasted rice, it must first be decolorized by adding an equal vol. of *N*/3 $AgNO_3$, filtering, and then dissolving a measured vol. of the filtrate in 96% alc. as above. The basis of the method is discussed, and the various steps of the technic are justified. It is suggested that a standard should be established for Nuoc-Mam, requiring a min. of 200 g. NaCl per l. (with a tolerance of —10%), and total N 12–15 g. per l. Total N should consist of 13–15% $NH_3$ nitrogen and 85–87% org. N; the latter should consist of 85% amino acids and polypeptides (of which 5% are diamino acids), 12% urea N, 1.5% nucleinic N and 1.5% creatinic N. A. PAPINEAU-COUTURE

**Guide to bromatological analysis. Vegetable condiments.** ANTONIO CERIOTTI. *Ediciones soc. nac. farm.* (Buenos Aires) **1932**, 23 pp.; cf. *C. A.* **26**, 1381.—Condiments and spices of vegetable origin are defined and classified, a chem. grouping being preferred to the older classifications based on origin or function. Macroscopic and microscopic characteristics are described, and analytical methods and limits are discussed with respect to moisture, alc. ext., ether ext., ash, total N, starch, pentosans and microanalysis. Specific information is given concerning the properties and identification of savory, sweet basil, capers, anise, star anise, celery seed and saffron. J. F. S.

**The determination of inulin and levulosin applied to the analysis of coffee substitutes and to the problem of caramelization.** C. I. KRUISHEER. *Chem. Weekblad* **30**, 154–66(1933); cf. *C. A.* **25**, 1596.—Inulin breaks down in 10 min. when subjected to a Clerget inversion at 68–70°. Thus the fructose content after such treatment is a measure of the inulin content provided other sources of fructose are absent. From a comparative investigation of various materials contg. inulin it has been confirmed that it is always accompanied by 5–10% combined glucose. Pure inulin could not be obtained, but this problem will be further investigated. Inulin begins to break in the tech. drying of chicory root. In tech. roasting levulosin is formed. At the time part of the fructose breaks down. After hydrolysis there is still an exc fructose over glucose. The ratio 4 to 1 is characteristic of roasted inulin pro The formation of hydroxymethylfurfuraldehyde (about 2%) was noticed, but very little furfuraldehyde is formed. The detection of inulin products (chicory) in coffee and coffee essence is possible, since fructose compds. are practically absent. The presence of burnt sugar in coffee products is detectable by the presence of levulosin, without the amt. of fructose exceeding that of glucose in this case. An investigation of burnt sugar and other tech. baked products led to a closer study of caramelization. The ideas of Pictet (cf. *C. A.* **18**, 3045) appear to be untenable. "Isosaccharosan" appears to be a mixt. of different substances including probably levulosin and glucosin. The occurrence of "caramelan" and "caramelen" is also fictitious. Addn. of alkali on caramelization is characterized by very considerable decompn. of monosaccharides, absence of levulosin and glucosin and a partial decompn. similar to heating of alk. solns. of monosaccharides. E. SCHOTTE

**The examination of paprika. I. Effect of solvents in the determination of the extract content of paprika.** JENÖ MÓTUSZ. *Kisérletügyi Kozlemények* **35**, 167–70 (1932).—As solvents acetone, ether, petr. ether, benzene, dioxane, $CCl_4$, $CHCl_3$ and $CS_2$ were examd. Least color is extd. by acetone and dioxane, but the dissolved fat is impure. Best solvents were petr. ether and ether; $CCl_4$ and benzene are suitable S. S. DE FINÁLY

**Effect of storage on vitamin A in dried foods.** G. S. FRAPS AND RAY TREICHLER *Ind. Eng. Chem.* **25**, 465–6(1933).—There is a gradual loss in vitamin A content during the storage of alfalfa leaf meal, dried black-eyed peas, dried green sweet peppers, yellow corn and powd. whole milk. Measured by the Sherman-Munsell unit method, alfalfa leaf meal lost about 50% of its vitamin A in 11 months, dried black-eyed peas 50% in 9 months, dried green sweet peppers 80% in 19 months, powd. whole milk 60% in 9 months and yellow corn 30–50% in 6 months. Grinding corn before storage does not seem to increase to any noticeable degree the loss of the vitamin A in yellow corn as compared with the whole grain. F. L. DUNLAP

**Investigations on stored grain.** STANISLAW KRAUZE. *Wiadomości Farm.* 60, 15–17, 43–5, 69–71, 84–7(87 in German)(1933).—The moisture content of stored grain depends on its respiration, its chem. and enzymic changes and on atm. conditions. Max. annual changes of the moisture content of grain were: rye 4.44, oats 2.68, barley 3.74%. The moisture content and wt./hl. of the grain were, resp.: oats 14.58%, 51.7 kg.; barley 17.01, 68.9; rye 17.47, 71.7. A relation between the moisture content and the germinating ability could not be established except with oats. Here a higher moisture content lowers the germinating power. J. WIERTELAK

**Composition and utilization of Texas feeding stuffs.** G. S. FRAPS. Tex. Agr. Expt. Sta., *Bull.* **461**, 5–63(1932).—The averages of the compns. of over 600 classes of feeding stuffs based on 22,000 analyses are given along with productive energy and digestible protein. C. R. FELLERS

**A new sugar feed preparation.** VL. STANĚK. *Listy Cukrovar.* **51**, 41–2; *Z. Zuckerind. Čechoslovak. Rep.* **57**, 53–5(1932).—Denatured sugar is mixed with ground oilseed-cakes, beets, pulverized grain, brans, etc., and minerals as $CaCO_3$ and $Ca_3PO_4$ are added. The mixt. is dampened with steam and then heated in a press until a plastic mass forms which is pressed through small circular orifices to form long strings. The cooled mass is broken up to form small grains. The material is very stable and does not become a paste in damp atms.; it contains 2–3% $H_2O$. The compn. shows

83% sugar, 14% bran, 1% NaCl, 1% spodium powders and 1% $Ca_3PO_4$. Expts. conducted with horses, hogs, sheep, chickens and fish have been satisfactory. F. M.

**The conservation of beet fodder.** ALOIS KROCZEK. *Listy Cukrovar.* **51**, 24–8, 34–6(1932); cf. *C. A.* **25**, 2780.—Beet greens, clover, alfalfa and corn silage were stored in surface heaps, soil pits and cement silos throughout the winter season. From highly albuminous and low-sugar-contg. beet greens, a good fodder is easily prepd. by a slow fermentation in the cold. The addn. of sucrose hastened an early production of lactic acid and retarded the formation of butyric and acetic acids. A moisture content of 60% was the optimum for producing a good fodder. The max. concn. of lactic acid produced was 3%; higher concns. inhibited the activity of the lactic acid-forming organisms; this concn. is in the range in which it is devoured by cattle. A high access of O as in surface heaps favors the formation of AcOH and decreases the formation of lactic acid. FRANK MARESH

**A rapid and appreciable improvement in tropical stock raising can be obtained by the use of solid or liquid phosphates.** EDM. LEPLAE. *Bull. agr. Congo Belge* **23**, 297–315(1932).—A lengthy review of the work, particularly that of Theiler and his co-workers, on the appearance of pica and osteomalacia and related diseases among stock. These diseases are caused to a large extent by a deficiency of P in the feed which can be overcome most advantageously through the use of bone meal as a supplementary feed or of a sol. phosphate in the drinking water. The addn. of this P also increases the reproductivity of the stock. J. R. ADAMS

**Steaming potatoes in silos.** H. HILDEBRANDT AND K. LEMKE. *Futterkonservierg* **3**, 72(1931); *Fortschr. Landw.* **7**, 18.—Ensiled potatoes steamed directly in the silo become brown, whereas those ensiled after steaming in vats retain their natural color and have a higher food value K. D. JACOB

**Spear grass.** [**Heteropogon contortus, R. and S.**] J. M. RATTRAY. *Rhodesia Agr. J.* **29**, 365–70(1932).—An air-dried sample of spear grass in full flower contained: $H_2O$ 11.2, ash 4.9, crude protein 3.9, ether ext. 1.5, fiber 36.0 and carbohydrates 42.5%. A. L. MEHRING

**Nutritive value of kolukkattai grass [Pennisetum cenchroides] dried artificially.** T MURARI. *Agr. and Live-stock in India* **2**, 380–2(1932).—The dried hay contained ash 10.68, crude protein 20.16, $Et_2O$ ext 2.79, crude fiber 24.16, carbohydrates 38.15 and albuminoids 15.98% Feeding expts. with calves indicated that 1.75 lb. of the dried hay is equiv in nutrient value to 1 lb. of a mixt. of equal parts peanut meal and wheat bran. K. D. JACOB

The mannitol fermentation of beet fodder (VONDRÁK) **16**. The mineral requirements of livestock (DU TOIT, MALAN) **15**. Disinfection of coffee beans (SLADDEN) **15**. Chemical analyses of pasture plants (COOPER, *et al.*) **15**. Margarine (Brit. pat. 366,909) **13**. Caffeine (Brit. pat. 366,305) **17**.

**Food products containing vitamins.** LUIGI BERNARDINI. Brit. 366,516, Oct. 19, 1929. In prepg. food products an oily substance contg. lipoids and lipoid-sol. vitamins, obtained by extg. with an org. solvent the germ-contg. by-products of husking or milling seeds, particularly cereals, or the germs sepd. from said by-products, and a powder or flour contg. hydrosol. vitamins, obtained by milling the extd. germs and sifting to sep. the powder or flour from the cortical elements, are added to the food products.

**Coil and header heat-transfer apparatus suitable for "processing" foods.** HAROLD E. SMITH (to Pfaudler Co.). U. S. 1,891,058, Dec. 13. Structural features.

**Preserving aqueous foods.** SIEGFRIED SCHNIBBEN. Ger. 568,480, May 10, 1931. An aldehyde such as $CH_2O$ or AcH is added, followed by sufficient $H_2O_2$ to oxidize the aldehyde to acid.

**Apparatus for conditioning and drying cereals in an uninterrupted stream.** ERNST

ROTH (to the firm Gebrüder Buhler). U. S. 1,892,319, Dec. 27. Structural features of an app. in which cereals may be treated with air currents.

**Electrode vessel for determining the conductivity of milk, etc.** N. GERBER's Co. G. M. B. H. Ger. 568,476, Sept. 20, 1930.

**Evaporating milk and cream.** N. V. GRUYÈRE-BLOKMELK FABRIEK. Brit. 366,421, July 26, 1930. A solid stable milk or cream prepn. is made by evapg. sweetened milk or cream in large-capacity app. at 50–65° until the major part of the $H_2O$ is removed, then evapg. further in small-capacity app. with stirring at not over 50° until the $H_2O$ content is 7–15% and finally molding into blocks or other shapes.

**Apparatus for homogenizing milk, cream, etc.** HENRI CORBLIN. Brit. 364,921, Mar. 4, 1931.

**"Processing" cheese.** RICHARD PASTERNACK and RICHARD W. BURNHAM (to Charles Pfizer & Co.). U. S. 1,890,948, Dec. 13. A sol. gluconate such as Na, K, $NH_4$ or Ca gluconate is added to the cheese, and the material is heated to a temp. sufficiently high (suitably about 70°) to destroy undesirable bacteria present without disintegrating the cheese. The gluconate serves as an emulsifying agent.

**Egg powder.** FOREST H. CLICKNER (to Endowment Foundation). U. S. 1,891,887, Dec. 20. After removal of egg material from the shells, it is dild. with at least 15% of added water and emulsified by agitation; insol. or unemulsifiable materials are sepd. (suitably by straining); and the emulsion is subjected to spray desiccation.

**Apparatus for concentrating fruit pulps and sirups.** EUDO MONTI. Brit. 366,010, Oct. 25, 1929.

**Liquid coffee extract.** WM. W. GIFFEN and CLINTON W. CARTER (to International Liquid Coffee Co.). U. S. 1,891,383, Dec. 20. Various details are given of a process involving maceration and extn. of coffee with successive portions of water of specified quantities and at a temp. of 30–50° throughout the process.

**Psyllium-seed product for use as a food accessory.** LOUIS A. TUVIN. U. S. 1,891,697, Dec. 20. Psyllium seeds are coated with sugar and then with an overlying coating of a moisture-absorbing gum such as India gum. U. S. 1,891,698 also relates to details of a method of prepg. a product of this character.

**Treatment of lupines.** BERNHARD BLECKEN. Ger. 568,483, Oct. 23, 1931. To remove the bitter constituents, lupines are mixed with $Ca_3(PO_4)_2$ 2 and $CaCO_3$ 5%, then crushed with rollers, strewn with $Ca_3(PO_4)_2$ and sifted to sep. Ca salts. They are then mixed with about 10% of a fertilizing salt, *e. g.*, a K salt, stirred with water, left for 1 day and finally washed. The first wash water is used as a *fertilizer*.

**Straw feed.** A. DE VREESE. Belg. 389,232, July 30, 1932. Straw is treated with lime in soln., sugar soln. is added to dissolve the excess lime and the liquid is sepd. from the straw. The liquid is treated to eliminate CaO and is concd. The straw is treated with an alk. liquor and washed. The treated straw, either alone or in admixt. with the concd. liquid, is used as stock feed.

## 13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

**Chemical industry in Italy in 1932.** M. TREVES. *Ind. Chemist* 9, 42–4(1933) E. H.

**The theory of industrial filtration. A research problem for the chemical engineer.** W. SIEGEL. *Chem. Fabrik* 1933, 89–92.—"A synopsis of the 'Theory of filtration during the formation of filter cakes,' as well as the status, difficulties and problems of the investigation," with 10 references. J. H. MOORE

**Reclamation of industrial solvents.** E. KLAPPER. *Allgem. Öl. Fett-Ztg.* 29, 169–70(1932).—A review. W. F. BOLLENS

**Chemical-technical problems in the printing trade.** JULIUS BEKK. *Angew Chem.* 46, 125–9(1933).—A discussion. KARL KAMMERMEYER

**The "mol" saves your time.** E. F. DAWSON. *Power* 76, 202–4(1932).—D. discusses and illustrates the molal method of computation as a time saver for power engineers. ALDEN H. EMERY

**Revised charts for the calculation of gas radiations.** SUSUMU UCHIDA *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 24–7(1933); cf. Hottel, *C. A.* 21, 3994.—New nomographs based on later data are given for the radiation of heat. G. M. E.

**Practical methods for heating solids by induction.** E. F. NORTHRUP. *Iron Age* 131, 165, adv. page 14, 310–11, adv. page 10(1933). E. H.

**Heating with hot water.** R. DUFUY. *Chaleur & ind.* 14, 30–8(1933); cf. *C. A.*

**27**, 1064.—Theoretical discussion and justification of the method used to calc. the diams Math. and thermodynamic treatment are discussed. KARL KAMMERMEYER

**Modern processes of evaporation, drying and heating with superheated water.** F. MUHLERT. *Chaleur & ind.* **14**, 17–20(1933).—A discussion with diagrams of new constructions. KARL KAMMERMEYER

**Evaporation from different kinds of pans.** CARL ROHWER. *Proc. Am. Soc. Civil Engrs.* **59**, 223–53(1933).—R. recommends the use of Class-A land pans of the Weather Bur. for evapn. studies. Many data are given to support the recommendations. W. D. HATFIELD

**Evaporation from reservoir surfaces.** ROBERT FOLLANSBEE. *Proc. Am. Soc. Civil Engrs.* **59**, 254–65(1933).—Interesting data are given on the evapn. from reservoir surfaces in the U. S. and foreign countries. W. D. HATFIELD

**Velocities in suction mains and evaporators. Anhydrous ammonia.** J. O. SCHULTZ. *Ice and Refrigeration* **84**, 113–14(1933).—Velocities and max. load-carrying capacity of refrigerator coils are given for $NH_3$. ALICE W. EPPERSON

**Velocities in suction mains and evaporators. Methyl chloride.** J. O. SCHULTZ. *Ice and Refrigeration* **84**, 211(1933); cf. preceding abstract. A. W. E.

**Aldehydes.** A. THOMAS. *Rev. gén. mat. plastiques* **9**, 21–5(1933).—A brief outline of the properties of $CH_2O$, of its toxicity and of sanitary measures to treat or prevent intoxications in industries using it. A. PAPINEAU-COUTURE

**Solid carbon dioxide from flue gas by application of Joule-Thomson effect.** FRANK E. E. GERMANN. *Ind. Eng. Chem.* **25**, 150–2(1933).—Flue gas contg. about 10% $CO_2$ is compressed to 3000 lb., then allowed to expand to 10 atm. in an expansion engine loaded with an elec. generator. The Joule-Thomson effect cools the gases to about —104°. As much as 90% of the $CO_2$ is thus transformed into a cryst. solid of marketable quality. The cost is estd. at no more than $25.00 per ton. A. L. H

**Waste carbon dioxide and the dry-ice industry.** K. HAUPT. *Brennstoff-Chem.* **13**, 370–3(1932).—The $K_2CO_3$ and triethanolamine processes for $CO_2$ recovery are discussed, and the Frick and Carba systems for producing solid $CO_2$ are described. F. W. JUNG

**Ebullition of refrigerants.** L. A. PHILIPP AND B. E. TIFFANY. *Refrigerating Eng.* **25**, 140–6(1933).—It was found that when liquid $SO_2$ was mixed with a small quantity of lubricating oil, the liquid $SO_2$ could be superheated by as much as 50°F. without ebullition when the test was conducted in glass vessels and by as much as 30°F. when the test was conducted in Cu or brass vessels. The addn. of wood or any vegetable fibrous matter to the liquid reduced the superheating of the liquid $SO_2$ to only a few degrees. A general theory was given setting forth the mechanism of ebullition and the promotion of ebullition by initiators such as wood. A. H. J.

**The new English patent law.** OTAKAR FALLADA. *Listy Cukrovar.* **51**, 131–2; *Z. Zuckerind. Čechoslovak. Rep.* **57**, 103–4(1932).—The law is compared with the existing laws in central Europe, and its influence upon applications for patents is discussed. FRANK MARESH

---

**Effecting catalytic reactions.** I. G. FARBENIND. A.-G. (Johannes Brode and Georg Kalb, inventors). Ger. 568,205, Feb. 22, 1928. In effecting reactions with the aid of catalysts comprising metals which m. below the reaction temp., fusion of the catalyst is avoided by using a catalyst prepd. by reducing a compd. of the catalytic metal in the presence of an intimately mixed reducible compd. of another metal. The other metal must be one which m. above the reaction temp. and forms with the catalytic

metal alloys which also m. above the reaction temp. Thus, a catalyst for the manuf. of BzH from phthalic anhydride at 350° may be prepd. by reducing a pptd. mixt. of $Bi(OH)_3$ and $Cu(OH)_2$.

**Catalytic gas reactions.** ERIC HANSON SALE and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 364,215, Oct. 18, 1930. In carrying out catalytic gas reactions at an elevated temp. the reactants are separately preheated by heat exchange with different portions of the reaction products, the extent to which each reactant is preheated being controlled independently by regulating the amt. of the reaction product with which it contacts, preferably by means of a valve on the cold side of the heat exchanger. The process is applicable to catalytic hydrogenation of org. compds.

**Purifying gases.** I. G. FARBENIND. A.-G. Fr. 738,747, June 17, 1932. $SO_2$ is removed from gases by washing them with a liquid which contains an org. acid substance in admixt. or combination with basic compds. of alkali or alk. earth metals. The org. compd. may be an amino acid, aminosulfonic acid, phenols and their derivs., phthalic acid and its derivs., etc. The inorg. base may be an oxide, hydrate, carbonate, etc., of an alkali or alk. earth metal or of Mg or Be. $CO_2$ may be eliminated first by a treatment at a temp. not above 90°. If $CO_2$ is not present, an excess of the basic compd. is used.

**Washing gases.** LONDON POWER CO., LTD., and S. L. PEARCE. Brit. 333,309, Aug. 1, 1931, addition to 334,660 (*C. A.* **25**, 1062). Air is added to gases before or during treatment in such quantity that the mixt. contains 9% or under $CO_2$ and at least 10% $O_2$. The $O_2$ content of the washing soln. should not be less than 60% at atmospheric temp.

**Separating gaseous mixtures.** METALLGESELLSCHAFT A.-G. Brit. 367,209, May 1, 1930. In the recovery of gases and vapors from mixts. by adsorption, *e. g.*, by active C, silica gel, etc., and expulsion by steam, *e. g.*, the recovery of nitrocellulose solvent vapors in the rayon industry, the gases, following the flushing period and without the interposition of special cooling or drying processes, are heated, if necessary, and allowed to act on the adsorption medium up to 120°, preferably 40–70°, the elevated temp being maintained during the whole or at the commencement only of the adsorption period, no other heat being supplied.

**Separating mixed gases as in purifying liquid oxygen.** JOHANNES A. VAN GESSEL (to N. V. Philips' Gloeilampenfabrieken). U. S. 1,891,125, Dec. 13. The liquefied gas mixt. is brought into contact with material such as charcoal or silica gel which has a selective adsorbent action for one of the constituents. App. is described.

**Apparatus for liquefaction and rectification of gas mixtures such as air.** ISAAC H. LEVIN. U. S. 1,892,155, Dec. 27. Various structural, mech. and operative details are described.

**Colloidal suspensions.** EINSTEIN'S ELECTRO CHEMICAL PROCESS, LTD., and EMIL HATSCHEK. Brit. 366,128, Oct. 30, 1930. Solids are treated to enable them to be colloidally suspended in oils by grinding them with an aq. soln. of a soap and treating the resulting suspension with an agent which is adapted to ppt. the soap as a coating on the particles and is present in sufficient quantity to coagulate the suspension. The coated particles are then incorporated with the oil and the assocd. $H_2O$ eliminated, *e. g.*, by drying, or the particles may be dried before incorporation. In an example powd. graphite is mixed with Na oleate, made into colloidal suspension, the soap coagulated with $Al_2(SO_4)_3$ and the coated particles, after washing with $H_2O$, incorporated with mineral oil to give a suspension contg. 10–15% graphite, which is then heated with stirring to remove $H_2O$.

**Emulsions; margarine.** BENJAMIN R. HARRIS (to The Emulsol Corp.). Brit 366,909, Aug. 2, 1929. See Fr. 705,000 (*C. A.* **25**, 5219).

**Recovering volatile solvents.** CARRIER ENGINEERING CO., LTD., and JOHN S JONES. Brit. 366,968, Nov. 5, 1930. In the recovery of volatile substances evapd from articles during manuf. by absorption in a gas, circulated through the treatment chamber and subsequently treated with a solvent to recover the substance, the evapn. of the substance is controlled by regulating simultaneously the temp. and the concn. of the substance in the gas by regulating the concn. in the solvent and the temp. of the soln. App. is described.

**Molding respiratory masks.** DRÄGERWERK-HEINR. & BERNH. DRÄGER (to Otto H. Dräger). Brit. 365,347, Mar. 5, 1930. Respiratory masks are made by placing superposed alternate layers of fabric and impermeabilizing material, *e. g.*, unvulcanized sheet rubber, in a mold and combining them after molding, as by heating, in the mold to soften and vulcanize the rubber.

**Device for making solid carbon dioxide.** JOSEPH GRISON. Brit. 363,870, Jan. 28, 1931.

**Refrigerant.** JAMES J. CRONIN. Australia 27,854, July 16, 1930. A soln. of

$Na_2CO_3$ and $Na_2SO_4$ in water is frozen and used as a refrigerant. Australia 3312/31, describes the use of a soln. of $Na_2SO_4$ alone.

**Porous compositions.** LUDWIG WURM, RUDOLF WURM, PAVEL GÜTIG and EMIL WURM (trading as Isolierwerke Brüder Wurm). Brit. 364,819, Dec. 23, 1929. Non-absorptive, porous, heat-insulating compns. are made by mixing with known raw materials an emulsion of substances immiscible with and insol. with water and subjecting the product to a temp. above the m. p. of the impregnation substance if this is a solid. In an example bricks are produced from basic Mg carbonate 85 parts, asbestos 15 and emulsified paraffin wax 2. The mixt. is agitated, placed in molds, dried and heated to 80° in an atm. contg. less than 21% O.

**Heat-insulating compositions.** CHARLES H. OWEN. Brit. 365,525, Oct. 15, 1930. The compns. for application as plasters or for molding comprise a cement, a clay, *e. g.*, "ground fire-clay," or clay equiv. such as ganister and a porous filler, *e. g.*, slag dust, pumice powder or kieselguhr.

**Heat-insulating bat suitable for use in building construction.** FRANCIS W. HARNEY (to Upson Co.). U. S. 1,890,906, Dec. 13. A bat filling such as jute or cotton assocd. with a fire-proofing substance such as an $NH_4$ salt is provided with a liner of paper with an adhesive such as Na silicate which is capable of reacting with the substance in the bat filler, and the liner is sepd. from the filler by a material such as kraft paper to reduce such reaction.

**Heat- and sound-insulating composition.** ALEXANDER MELVILLE, JAMES T. MILLAR and ROBERT S. T. HENRY. Brit. 364,314, Dec. 18, 1930. The compn. is a mixt. of paper-mill waste ("lime sludge," which is C and $CaCO_3$ and (or) "machine sludge," which is cellulose and china clay) and kieselguhr or its equiv., and, if desired, asbestos.

**Heat- and sound-insulating material.** ELTON R. DARLING (to Pacific Lumber Co.). U. S. 1,892,138, Dec. 27. Rounded "sand-like" particles of material derived from redwood bark are used with about one-third their quantity of exfoliated zonolite.

**Electric resistors.** SÁNDOR JUST. Hung. 104,814, Sept. 16, 1929. Boron nitride is added to first-class conductors (*e. g.*, coal, graphite or metal powder) or to mixts. of these with second-class conductors (oxides, silicates, carbides). Coal tar or pitch is used as binding material, and the compn. is pressed into forms, dried and ignited in absence of air.

**Electrical insulation suitable for use on wiring, etc.** OLIVER B. HUSKEY. U. S. 1,892,105, Dec. 27. Boiled linseed oil 52, japan drier 26, olive oil 20, pumic stone 1 and coloring material such as a brown oil 1%.

**Coating wires with colored insulation, etc.** ALBERT T. CANDY, JR. (to Candy & Co.). U. S. 1,891,501, Dec. 20. Various details of app. and operation are described.

**Flame-proofing insulation on wires.** ERNEST C. CROCKER (to Arthur D. Little, Inc.). U. S. 1,891,258, Dec. 20. Flame-proofing is effected by use of an aq. soln. of dextrin contg. powd. Se.

**Paper for use in wrapping conductors to form insulation.** JOSEPH A. KENNEDY (to Anaconda Wire and Cable Co.). U. S. 1,892,059, Dec. 27. In "processing" rolls of paper strip for forming insulating wrappings, the rolls are treated with a bath of wax to saturate the paper and then are treated in an aq. soap soln. to permeate and partially displace the wax with the soap at the edges of the strip and thus render the edges soft and pliable.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**The past year's waterworks activities in Ontario.** A. E. BERRY. *Contract Record and Eng. Rev.* **46**, 1448–51(1932); cf. *C. A.* **26**, 1688. R. E. THOMPSON

**Developments in water supply and treatment during the past year.** NORMAN J. HOWARD. *Contract Record and Eng. Rev.* **46**, 1442–7(1932); **47**, 9–12(1933); cf. *C. A.* **26**, 1685.—A comprehensive review of progress during 1932. At the end of the year there were 396 plants employing activated C for taste and odor removal. R. E. THOMSON

**The daily fluctuations of oxygen content and $p_H$ of Balaton water.** C. M. MALDURA. *Magyar Biol. Kutató Intézet Munkái* **4**, 621–2(in Italian 622–5)(1931).—The O content of the water of Lake Balaton (Hungary) varies between 6.3 and 7.2 cc. per l. and reaches its max. in the afternoon. It is independent of the temp. The $p_H$ ranges from 8.38 to 8.55, reaches a max. in the early morning and decreases afterward. S. S. DE FINÁLY

**The properties, examination and purification of surface water.** BERTIL GROTH.

*Svensk Pappers-Tidn.* 35, 744–9, 778–87(1932).—Descriptive, with special reference to biol. impurities, purification by alums and *use of the water in the Swedish paper industries.* WILHELM SEGERBLOM

**Utilization of active carbon in water purification.** CURT MÜLLER. *Wasser u. Gas* 23, 248–59(1933).—A thorough review including history of development, types of C available, data on the efficiency of these types with regard to grain size and adsorptive power, filtering times and typical data from a no. of different water works. This is a preliminary note. HOWARD AGNEW SMITH

**The oligodynamic action of silver in the treatment of water.** J. GIBBARD. *Can. Pub. Health J.* 24, 96–7(1933).—Results of expts. on exposure of water contg. *E. coli* to silvered porcelain rings are summarized. Low temp. (8–10° compared with 22–5°) markedly retards oligodynamic action: the presence of org. matter has a similar effect. The rings gradually lose their activity but may be completely rejuvenated by treatment with dil. HCl. Their activity is definitely, although not greatly, less in the light than in the dark. Exposure for at least 1–1.5 hrs. is necessary with new rings: un favorable conditions 24 hrs. may be required. The treated water has bact properties. The concn. of Ag in the treated water increases with the time of as follows: 1 hr. 0.03, 2 hrs. 0.07, 3 hrs. 0.15, and 4 hrs. 0.5 p. p. m. This met treatment cannot be recommended for practical use at the present time. R.

**Shellfish-treatment plant at Newburyport, Mass.** EDWARD WRIGHT. *Pub. Health* 23, 266–9(1933).—Complete details are given for Cl treatment of sl Rules and regulations relative to the operation of plants for the treatment of shellfish as adopted by the Mass. Dept. Public Health on March 8, 1932, are also giv J. A. KENNEDY

**The use of sodium bicarbonate and calcium in the rectification of sea water in aquaria.** C. M. BREDER AND H. W. SMITH. *J. Marine Biol. Assoc. United Kingdom* 18, 199–200(1932). C. M. McCAY

**The effect of long-continued additions of lime to aquarium sea water.** L. H. N. COOPER. *J. Marine Biol. Assoc. United Kingdom* 18, 201–2(1932). C. M. McCAY

**Water softening by base exchange.** EDWARD BARTOW. *Proc. Iowa Acad. Sci* 38, 151–5(1931).—A popular description of the base exchange or zeolite system of water softening and a discussion of the disadvantages of hard water in a household, the advantages of a water softener of the type mentioned and its approx. cost for the home. W. G. GAESSLER

**Economies effected by treating boiler feed water with trisodium phosphate.** F KROME. *Wärme* 55, 452–3(1932); *Chimie & industrie* 29, 69.—A brief outline of the advantages of the process. A. PAPINEAU-COUTURE

**Use of chemically purified water in high-pressure [40 atmospheres] boilers.** F. KÖGLER. *Wärme* 55, 515–17, 529–34, 548–9(1932); *Chimie & industrie* 29, 70.—Most raw waters, after treatment by the soda process, are sufficiently purified for use in boilers operating up to 40 atm.; care must be taken, however, to avoid possible soln. of $SiO_2$ from the sand filters by the alk. water at 90–100°. During degassing at 100° there is a considerable increase in the NaOH content because of thermal decompn. of $Na_2CO_3$. A water contg. about: $Na_2SO_4$ 0.4–0.5, NaCl 0.2–0.35, NaOH 0.06–0.07, $Na_2CO_3$ 0.08 0.1, $SiO_2$ 0.006–0.008 g. per l. gives but a negligible and easily detachable deposit, which becomes dangerous only at relatively high $SiO_2$ contents (10–15 mg. per l.) For such cases K. recommends the use of $Na_3PO_4$ to remove scale from the boiler, which is also useful to prevent formation of scale. A. PAPINEAU-COUTURE

**Feed water in the construction and operation of high-pressure steam boilers.** LIST. *Svensk Pappers-Tidn.* 35, 813–32(1932).—Descriptive. Twenty-nine diagrams and graphs and 11 equations for the removal of Ca and Mg compds. are given. W. S.

**Ultra-microscopic examination of boiler water as a valuable supplement of chemical analyses.** A. KLEIN. *Wärme* 55, 103–6; *Wasser u. Abwasser* 30, 83 (1932).—The use of the dark-field microscope for the ultra-microscopic examn. of water during the process of clarification is explained. Eight illustrations are given in the original article. F. P. GRIFFITHS

**Protective action of zinc plates in boilers.** C. O. BANNISTER AND R. KERR. *Metal Ind.* (London) 41, 441–3, 467–70(1932).—The potentials between Zn and steel of various grades were measured in different types of water by means of a potentiometer and a recording voltmeter. A large-scale expt. was carried out with Zn plates, fastened in different manners, in a ship boiler. Pb contamination up to 2.5% does not affect the potential between Zn and steel seriously. Fe above 0.06% is a likely source of trouble. Conclusions: The protection of the boiler steel by Zn plates is due more to purely *chem. action by removal of O, than to electrochem. protection.* LEOPOLD PESSEL

**Boiler sediment, a neglected enemy of steam boilers.** H. RICHTER. *Listy Cukrovar.* 50, 545–8; *Z. Zuckerind. Tschechoslovak. Rep.* 57, 92–6(1932); cf. *C. A.* 26,

2807.—The sediments in boilers exert a chem. and a mech. effect on the boiler wall. After the formation of the sediment, the structure was loose and flaky; only after the lapse of a crit. period, does it become dense and adhesive. For a remedy, R. recommends a periodic discharge of water laden with sediments from the boiler every 1 to 2 hrs. FRANK MARESH

**Removal of positive ions by electroösmose apparatus.** EDWARD BARTOW AND MILO A. FRY. *Ind. Eng. Chem.* **25**, 336–8(1933).—Hard waters were prepd. by dissolving about 200 mg. per l. of NaCl, $CaCl_2$, $MgCl_2$ or some combination of them in distd. $H_2O$. These artificial hard waters were treated in a 10-cell electroösmose app. and samples from the cells 1, 3, 6, 9 and the overflow were analyzed. Seven tables of data show that: The order of removal is Na, Ca, Mg. The removal in the sixth cell is 90% except for Mg. The $H_2O$ in the ninth cell is nearly equiv. to distd. $H_2O$. The removal when the rate of flow is 30 l. per hr. is not quite as good as for 20 l. or 25 l. per hr. F. E. BROWN

**Chlorination of water containing inorganic and organic substances. The disinfecting action of chlorine on anthrax-spore-containing maceration liquors from gelatin manufacture, from which is obtained feed calcium phosphate.** W. WEDEMANN. *Arb. Reichsgesundh.* **65**, 265–77(1932).—Water contg. Cl destroyed anthrax spores in all exptl. runs and resulted in a diminution of the Cl content. In no cases were active spores found after 1 hr. of contact with water contg. Cl. Tabular data are given. R. C. ERB

**Oxidation-potential concept of chlorination.** F. C. SCHMELKES. *Am. J. Pub. Health* **23**, 269–70(1933).—Measurements were presented of the oxidation potential in solns. of HOCl, chloramine, monochloroglycine and azochloramide. These measurements were compared with measurements of the rate of bacteria removal. The oxidation potential and bactericidal properties of $Cl_2$ were found to run parallel. Any changes which diminish bactericidal velocity also diminish the oxidation potential, and *vice versa*. Attention was drawn to the failings of the *o*-tolidine test, as the reagent reduces the $p_H$ of the soln. to be measured, because of the large amt. of HCl in the reagent, and thereby increases the oxidation potential to a high value. This test essentially measures the amt. of $Cl_2$ which can be converted into bactericidal and sterilizing $Cl_2$ by lowering the $p_H$. The test, therefore, does not distinguish between $Cl_2$ compds. of high and low oxidation potential. Attention is drawn to the fact that in the $NH_3$-Cl process advantage is deliberately taken of the reduction of the oxidation potential to prevent combination of $Cl_2$ with phenols and to prevent oxidation of org. matter, this increasing the persistency of the residual, and that this is being done at the expense of bactericidal velocity. A motion picture was presented, showing the slow death, cessation of movement, agglutination and disintegration of typhoid bacteria, brought about by treatment with low-potential chloramine compds. J. A. KENNEDY

**The significance of ammonia for the chlorine-fixing power of water. I.** M. L. KOSHKIN. *Z. Hyg. Infektionskrankh.* **114**, 413–24(1932).—$NH_3$ decreases the Cl-fixing power of $H_2O$. The decrease is less marked with increasing amts. of $NH_3$. The Cl-fixing power of plant exts. is strongly decreased by the presence of $NH_3$ but that of animal exts. only slightly. RACHEL BROWN

**Color scale for nesslerization.** RENÉ DANET. *J. pharm. chim.* **16**, 68(1932); cf. *C. A.* **22**, 2018.—An aq. soln. (*A*) contg. in 100 cc. 0.8 cc. of 10% $K_2CrO_4$ soln. and 22 cc. of 10% soln. of non-dried $Co(NO_3)_2$, corresponds to 0.010 g. $NH_3$ per l., nesslerized. Each 10 cc. of the waters to be examd. is treated with 5 drops of Nessler soln., and then the color intensities are compared with the following scale: Into 6 test tubes are placed 0.5, 1, 2, 3, 5 and 10 cc. of *A*, and $H_2O$ is added to each to make 10 cc. The colorations then correspond, resp., to 0.5, 1, 2, 3, 5 and 10 mg. of $NH_3$ per l. S. WALDBOTT

**The advantages of O'Meara's modification of the Voges-Proskauer test.** RALPH P. TITTSLER. *J. Bact.* **25**, 40–1(1933).—The rate of formation of color is more rapid, and the color is more intense. JOHN T. MYERS

**Proceedings of the Sixth Annual Conference, Maryland-Delaware Water and Sewerage Association, Cumberland, Maryland, April 12 and 13, 1932.** 128 pages; (abstr. in *J. Am. Water Works Assoc.* **25**, 158–60). **Elementary sewage disposal.** L. V. CARPENTER. 5–14. Tabulation of location, population served and methods of treatment at 38 sewage-treatment plants in Maryland. **Discussion.** G. L. HALL. **Admission of industrial wastes into sewerage systems. Symposium. Control of the pollution of streams.** 35–63. **Procedure in Delaware. Procedure in Pennsylvania.** R. C. BECKETT. **Procedure in West Virginia.** E. S. TISDALE. **Procedure in Maryland.** ABEL WOLMAN. **Influence of soils, rocks and minerals upon the potability of water.** J. J. SHANK. Surface waters acquire mineral constituents by flowing over soils and rocks of various solubilities. Ground waters which penetrate beneath the upper crust of the earth's surface acquire much greater mineral content than surface

waters, because of the longer and more intimate contact with soil and rock materials. The action taking place between ground waters and soil and rock materials is of the nature of solution, substitution, addition or combination. **Developments on powdered activated carbon in water plants during recent months.** F. E. STUART. 87–95. In addn. to its use for removal of tastes and odors, activated C is effective for elimination of putrefaction and liquefaction of settling-basin sludge; for improvement in coagulation, with consequent reduction of dosage of coagulant; for adsorption of org. matter, and thus for control of fluctuations in Cl demand; and for increase in Cl residual by application ahead of prechlorination dosage. **Discussion.** C. A. HECHMER. Experience at Washington Suburban Sanitary District has shown that the best results are obtained when C is applied to raw water with coagulant. It is fed by dry-feed machines at the rate of 0.1 grain per gal. at a cost of 85 cents per million gal. **Reservoir treatment with copper sulfate.** 112, *et seq.* At Baltimore 0.5 p. p. m. applied weekly retards algae growth below the point causing taste. At Hyattsville, Md., 0.35 p. p. m. applied semi-weekly is effective and more satisfactory than prechlorination. At Harrisburg, Penna., the usual recommendation is 2 lb. $CuSO_4$ per million gal. At Cumberland, Md., 4 lb. per million gal. is applied without any undue killing of fish.

**Preliminary report on the use of the sewage water of Schebitz [Breslau] for irrigation.** F. ZUNKER. *Der Kulturtechniker* 440–6(1931); *Wasser u. Abwasser* 30, 191.—Sewage, after passing through 2 clarification basins, is being used with very good results for fertilizing a large farm. F. P. GRIFFITHS

**Experiences in operating Dunbar sewage filters.** H. L. THACKWELL. *Eng. News-Record* **109**, 676–7(1932).—The sewage-treatment plant at Tyler, Tex., completed in 1930, consists of a grit chamber, vertical cage bar screen, chlorinator, multiple hopper-bottom settling tank, primary and secondary Dunbar filters (similar to slow sand filters), step aerator, sep. sludge-digestion tanks provided with heating coils and agitation devices, and glass-covered sludge-drying beds. The plant was designed for an av. flow of 0.6 and a max. of 1 million gal. daily and is at present being enlarged to provide for an addnl. 1 million gal. per day. Infiltration of acid ground water gives rise to difficulties: aeration and lime treatment have been found to be the most effective and economical corrective treatment. Biol. purification in Dunbar filters occurs largely in the rock and gravel layers, the sand serving as a strainer and supporting medium for the colloidal mat which acts as a true filter. The depth of sand can be reduced to 9 in by successive cleanings without seriously affecting their operation. An even grading of sand from 30-mesh to $^1/_4$-in. has proved satisfactory. Final settling is not required The head required is about 40% of that needed for trickling filters. When not overloaded, the filters reduce the biochem. O demand about 66%. The cost of operation is the wages of 1 laborer per acre of surface and the replacement of 2 in. of sand per year. R. E. THOMPSON

**Imhoff-tank effluent aerated to reduce load on filters.** W. R. DRURY. *Eng. News-Record* **109**, 752(1932).—A preaeration tank, ventilated trickling filters, final settling tanks and chlorination tanks were recently installed in Flint, Mich., the installation completing the plant which was initiated 4 years ago by the construction of radial-flow Imhoff tanks and sludge-drying beds. The secondary units were designed on the basis of results obtained during a year's operation of exptl. units. Expts. showed that 15–30 min. aeration of the Imhoff tank effluent would reduce the 5-day biochem. O demand 15–20% and increase the permissible rate of filter operation. The air from the tank is passed upward through the filter material, noxious odors being thus removed and the filters aerated to a certain extent. R. E. THOMPSON

**Effect of ferric chloride shown by sewage-plant tests.** HARVEY O. BANKS. *Munic. Sanit.* **4**, 48(1933).—A small exptl. sewage-treatment plant was operated at Palo Alto,

Calif. The possibility of regenerating a spent coagulant by the use of $Cl_2$ was tried out. This was not found to be feasible because of the gradual accumulation of org. matter on the floc. Plain coagulation of a settled sewage with a small dosage of $FeCl_3$ was found to be practical. Treatment gave 80–85% removal of suspended matter, and the biochem. O demand was reduced 65–70%. The process proved to be economical and attractive compared to biol. methods. E. R. MATHEWS

**Sewage plant rebuilt to treat rayon wastes.** U. F. TURPIN. *Eng. News-Record* **109**, 780–2(1932).—Creamery and rayon mill wastes completely inhibited bacterial action in the Imhoff tank and contact filters of the Sparta, Ill., sewage-treatment plant, and, after studies carried out with an exptl. activated-sludge plant, new works were constructed consisting of primary settling tanks, diffused aeration tanks, secondary settling tanks, sludge-digestion tanks and drying beds. The creamery wastes have had to be entirely eliminated from the sewage flow, it having been found that as little as 1% of casein waste interferes with the maintenance of a satisfactory activated sludge. The rayon-mill waste can be treated with the city sewage provided the grease content of the combined flow does not exceed 150–160 p. p. m. A chem. treatment tank was provided for sep. treatment of the "boil-off" waste with $FeSO_4$ and lime when the grease content exceeds that amt., it having been found that such treatment reduces the biochem. O demand of the "boil-off" waste approx. 95%. R. E. THOMPSON

**Application of the activated-sludge process.** E. F. ELDRIDGE. Mich. Eng. Expt. Sta., *Bull.* No. **48**, 3–32(1932).—An exptl. plant consisting of a Simplex aerator, settling tank and sludge-return pump was operated on milk wastes. Higher dissolved O content was obtained with mech. aeration than with compressed air. Biochem. O demand reductions as high as 95% were obtained with aeration tank sludge contents of 2000–2400 p. p. m. and 8–9.5 hr. aeration periods. Ammonia N was always dissipated or utilized in the aeration tank. Nitrite N occurred occasionally in the effluent, while nitrate N was never present. Fat removal was high and lactose was completely removed under optimum operating conditions. The $p_H$ varied from 7.3 to 7.8. The av. total solid reduction was 36%. Cost records for plants of different capacities are tabulated. This plant when operated on sewage contg. half strong domestic sewage and half milk wastes gave a lighter sludge than with sewage only. With this type of sewage mixt. stable effluents can be produced with biochem. O demand reductions of 90–93%. G. L. KELSO

**The oxidation of nitrogenous material in contaminated river water.** BEN H. PETERSON AND JOHN HANN. *Proc. Iowa Acad. Sci.* **38**, 165(1931).—A study is made of the rate of oxidation of the nitrogenous material in water taken from the Cedar River above, within and below the city of Cedar Rapids. Some of the carbonaceous material is first oxidized, this requiring all of the dissolved O if the sample is highly polluted. If sufficient dissolved O remains, the free $NH_3$ is converted to nitrite form, this being accompanied by a change of the org. N to $NH_3$. When nearly all the N is in nitrite form, further oxidation to nitrate N occurs. W. G. GAESSLER

**Effects of air contaminants on the natural light of cities.** H. B. MELLER AND MARY E. WARGA. *Am. J. Pub. Health* **23**, 217–24(1933). J. A. KENNEDY

**Industrial waste-gas and smoke problem and its solution.** H. WISLICENUS. *Beiheft Z. Ver. deut. Chem.* No. **3**, *Angew. Chem.* **46**, 104–5(1933).—A discussion with 5 literature references. KARL KAMMERMEYER

**Anaerobic stabilization of milk waste.** A. M. BUSWELL, C. S. BORUFF AND C. K. WIESMAN. *Ind. Eng. Chem.* **24**, 1423–5(1932).—Anaerobic fermentation followed by aerobic filtration treatment is only a small part of the cost of standard milk-waste-treatment methods. In addn. to the removal of 95% of the pollution load, 8.3–12.4 cu. ft. of gas of 550 B. t. u. can be recovered per lb. of dry solids at a cost of 6.1–10.3 cents per thousand cu. ft. G. L. KELSO

**The use of hydrocyanic acid for fumigation purposes.** C. L. WILLIAMS. *Can. Pub. Health J.* **23**, 567–70(1932); cf. *C. A.* **25**, 5726.—A discussion of the relative efficiency of various prepns., the exposure required for extermination of different insects, means of hastening dispersion and of clearing premises after fumigation, and toxic symptoms resulting from exposure to HCN. Temp. is important, the optimum being 75°F. or higher. The principal danger is absorption of HCN by bedding, etc. R. E. THOMPSON

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

**Petrographic methods for soil laboratories.** W. H. FRY. U. S. Dept. Agr., *Tech. Bull.* **344**, 1–96(1933).—The crystallographic, optical and manipulative principles necessary for the petrographic identification of crystals are presented. Directions are given for applying these methods to the identification of pure substances, the percentage estn. of the constituents of a mixt., the identification of minerals in soils, the differentiation of soil colloids from soil cryst. matter, the identification of soil org. matter and residue of organisms, the detn. of the shape of soil particles, the examn. of particle surfaces, soil structure and fertilizer materials, inspection of samples for purity, and the solution of phase-rule problems. Tables are appended giving the formula, mineral name, system, color, and optical properties for each of a no. of isotropic, uniaxial pos., uniaxial neg., biaxial pos. and biaxial neg. substances. W. H. Ross

**Soil science investigations at the melioration project in the Piano di Magadino.** H. GESSNER. *Schweiz. landw. Mh.* **9**, 231(1931); *Fortschr. Landw.* **7**, 113.—The soil is a typical alluvium and is predominantly sandy, the fresh alluvial sand contg. 5 9% of carbonate. Weathering results in the rapid removal of the carbonate and an increase in the sesquioxide content of the surface soil, the enrichment in sesquioxides corresponding to the leaching out of silicic acid, as much as 33% of the latter being removed in some cases. K. D. JACOB

**Improvement of solonetz soils.** L. P. ROZOV. *Trans. 6th Comm. Intern. Soc. Soil Sci., Pedology* (U. S. S. R.) **1932**, No. 3, 30–69.—Solonetz soils may retain their sp. properties for a long time under irrigation. Some cases show degradation with an increase in the alky. and absorbed Na and Mg in the lower layers. The presence of gypsum aids the degradation. B. C. A.

**Experimental testing of the question of soil tillage.** ORTTZ. *Landw. Fachpresse Tschechoslow.* **II**, 243(1931); *Fortschr. Landw.* **7**, 45.—Deep plowing increases the pore vol. and air content of soils, but has no significant effect on the $H_2O$ content. Shallow plowing, without addn. of lime, gradually caused a weakly acid soil (*p*H 6–6.5) to become more acid, whereas, under the same conditions, deep plowing resulted in a favorable condition as regarded the lime supply. With deep plowing, the yield of potatoes was not affected by applications of lime, but the yield was considerably decreased on shallow-plowed soils. Liming affects favorably the moisture supply of the upper layers of soil. K. D. JACOB

**Solubility of the solid phase of soil in water.** S. M. DRACHEV. *Soil Science* **35**, 75–83(1933).—The influence of varying vols. of $H_2O$ upon the soly. of soil compns. is studied. The soils studied are of the podzol, gray forest and chernozem groups. The soil-water ratio is varied from 1–1 to 1–128. A relationship exists between the vol. of solvent and the quantity of electrolytes which may be expressed by the equation $x = y\sqrt{V} + b$, where $x$ represents the sol. electrolytes as milliequivalents per 100 g. of soil, $V$ the ratio between vol. of solvent and wt. of soil, and $b$ the quantity of easily sol. salts extd. from the soil by a small vol. of $H_2O$. The value of $y$ for chernozem soils varies from 0.68 to 2.03 and podzols 0.04 to 0.34. In general, the chernozem soils show greater differences in sol. salt content at varying dilns. than do the podzols. Phosphate minerals such as apatite and phosphate rock behave on diln. very much like soils. $Na_2CO_3$ and humus extd. from solonetz soils with successively increasing $H_2O$ vols. are in good agreement with the values obtained by calcn. M. S. A.

**A general system of soils.** A. A. J. DE 'SIGMOND. *Mezögazdasági Kutatások* **5**, 391–404(1932).—The new system is based on the dynamic state of soils. Chief groups consist of soils of (1) org. origin, (2) mixed origin and (3) mineral origin. These chief groups are divided into 9 groups and further into 25 soil types. The method of application is shown by several practical examples. S. S. DE FINÁLY

**The physical properties and the adsorbed bases of soils.** LÁSZLÓ KOTZMANN. *Mezögazdasági Kutatások* **5**, 427–37(1932).—Two Hungarian soil samples were satd. with Ba, Ca, Mg, H, K, $NH_4$ and Na. One of the samples was a Ca soil of the chernozem type, the other a Na soil of the solonetz type. The dispersity was increased by univalent cations, and coagulation was caused by bivalent cations. On a system of sieves with meshes of 2, 1, 0.5 and 0.2 mm., the samples were covered with water for 24 hrs. Soils satd. with univalent bases could not form stable aggregates in water. Soils satd. with H or bivalent bases were stable in water. The plasticity limits of Atterberg are influenced by adsorbed cations. S. S. DE FINÁLY

**Influence of drying on the physicochemical properties of moor soils.** M. V. DOKUKIN. *Trans. 6th Comm. Intern. Soc. Soil Sci., Pedology* (U. S. S. R.) **1932**, No. 3, 70–2.—Dehydration of sphagnum peat gives rise to a decrease in the values of various physicochem. properties, the reverse being true for sedge-hypnum peats. B. C. A.

**The chemical composition of the colloidal portion with respect to the chemical composition of the soil.** L. SMOLÍK *Věstník Československ. Akad. Zemědělské* **8**, 593(1932); *Listy Cukrovar.* **51**, No. 9, Rozhledy 6.—Analyses of soils are given to show that $P_2O_5$, Fe, Al and Mg are found in the colloidal portion of the soil, while the other elements are found in fractions contg. particles of dimensions larger than colloidal. FRANK MARESH

**Continuous method for mechanical analysis of soils.** M. M. GODLIN. *Contr. Ukrain. Inst. Soil Research* **3**, 81–90(1931).—The app. consists of a Cu vessel, 8 cm. in diam., the lower end being fitted with a wide-stemmed glass funnel The top is covered with a Cu lid carrying a stopper which has a glass tube closed with a rubber tube and spring clip which, when opened after definite times, allows the suspension to flow out through the funnel. This method obviates the errors due to irregular settling and uneven suction. The results are quite comparable with those of the international standard method. B. C. A.

**Recognition of the chemical character of the colloidal fractions in soils.** L. SMOLÍK. *Věstník Československ. Akad. Zemědělské* **8**, 19(1932); *Listy Cukrovar.* **51**, No. 9, Rozhledy 6.—By means of a membrane hydrolysis, colloidal fractions of soils were sepd. into fractions of sols and a crystalloid fraction. The chem. compds. of the colloidal fraction, especially the bases, passed into the dialyzate; Fe, Al and Si did not pass through. The decreasing order of the bases was Na, Ca, K and Mg. FRANK MARESH

**The chemical resistance of soils and colloidal fractions.** L. SMOLÍK. *Věstník Československ. Akad. Zemědělské* **8**, 493(1932); *Listy Cukrovar.* **51**, No. 9, Rozhledy 6.—The resistant action of soils to alkalies or acids is related to the ability to form colloidal suspensions and is a function of the quantity of suspensoids produced. Soils contg. large quantities of suspensoids are highly resistant to the chem. action of alkalies or acids. In soils contg. the same quantity of suspensoids, the differences in chem. resistivity increased with the ratio of $SiO_2$ to the sesquioxides present. F. M.

**The method of determining the hydrolytic acidity of soils.** S. S. YARUSOV AND A. G. MURALEVA. *Chemisation Socialistic Agr.* **1**, No. 6, 8–32(1932).—The Csiky method was tested and found to give concordant results. Good results were also obtained by using the Vageler-Woltersdorf method. The Kappen method gave very large errors. J. S. JOFFE

**Cyclic salt changes in soils.** B. B. POLYNOV AND S. BUISTROV. *Trans. 6th Comm. Intern. Soc. Soil Sci., Pedology* (U. S. S. R.) **1932**, No. 3, 22–9.—The capillary rise of Cl and $SO_4$ ions in a column of loam soil was studied. In the lower parts of the column

$SO_4$ ion predominates, but gradually decreases upward, and at a height of 65 cm. no $SO_4$ ion is found; whereas Cl ion is found at all heights. Sands showed similar results; the concn. of both ions, however, decrease much more rapidly. B. C. A.

**Influence of bedrock on amounts of soluble [plant] nutrients in clays.** A. SALMINEN. *Maataloustieteellinen Aikakauskirja* (*J. Sci. Agr. Soc. Finland*) **1931**, 153.—Sources of essential soil constituents are examd. Chem. and mineral. compn. of Finnish clays is to some extent influenced by the nature of the original rock. B. C. A.

**The influence of temperature upon the assimilation of nutritive elements in a one per cent citric acid solution with Moravian climatogenic soil types.** L. STEJSKAL. *Věstník Československ. Akad. Zemědělské* **8**, 602(1932); *Listy Cukrovar.* **51**, No. 9, Rozhledy 6.—The quantity of $P_2O_5$ extd. by a 1% citric acid soln. varied markedly with the temp., and all analyses had to be made at 20°. Analyses show that the assimilable nutritive elements are decreased in the upper and surface strata but increased in the lower strata into which they are washed. FRANK MARESH

**The influence of increased concentrations of soil solution on the oil content in the seeds of oil-bearing plants.** S. E. SEREDA. *Chemisation Socialistic Agr.* **1**, No. 5, 53-63(1932).- From pot expts. with soy beans, hemp, flax, sunflower, poppy and others on a gray forest soil the following conclusions were made: an increase in concn of the soil soln. by adding nutrients—5, 10, 20 and 40%—increased the yield only up to 10% concn. With hemp the increase continued to 20% concn. The amt. of oil decreased with increase in concn. of nutrients, except for the soy beans and hemp, the oil contents of which increased with 5% increase in concn. The decrease is ascribed to the increase in protein content which is said to be antagonistic to oil formation J. S. J.

**Soils in relation to fruit growing in New York. I. Detailed soil survey of the Hilton Area, Monroe County.** A. T. SWEET AND JOSEPH OSKAMP. N. Y. (Cornell) Agr. Expt. Sta., *Bull* **541**, 3-16(1932).- A study of the suitability of soils for orcharding. C. R. FELLERS

**Some aspects of the growth of rice in heavy black soils of the Central Provinces.** D. V. BAL AND R. N. MISRA. *Agr. and Live-stock in India* **2**, 404-16(1932).—When a heavy soil formerly under wheat was converted into a rice field, the amt. of lime and the $p_H$ value of the soil were decreased. Expts. on the growth of rice in sand cultures with nutrient solns. of different $p_H$ values, indicated that the rice plant prefers a slightly acid or neutral medium to an alk. one. Pot and field expts. indicated that in heavy soils, with a basal dressing of green manure, S gives increased yields of rice, but better results are obtained by annual applications of superphosphate alone or with S. K. D. JACOB

**Toxicity of calcium arsenate in soils to plants.** H. P. COOPER, W. R. PADEN, E. E. HALL, W. B. ALBERT, W. B. ROGERS AND J. A. RILEY. S. Car. Agr. Expt. Sta., *45th Annual Rept.* 23-7(1932); cf. *C. A.* **26**, 4124.—A series of expts. are described showing definite toxicity in certain soils contg. $Ca_3(AsO_4)_2$ from cotton sprays. Oats, vetch and barley are particularly sensitive to As injury. Insol. arsenates, such as $FeAsO_4$, are non-toxic to plants. C. R. FELLERS

**Base interchange induced by calcium, magnesium and sodium nitrates in a six-foot column of soil-subsoil.** W. H. MACINTIRE, J. B. YOUNG AND W. M. SHAW. *Soil Science* **35**, 49-53(1933).- Single heavy addns. of $NaNO_3$, $Ca(NO_3)_2$ and $Mg(NO_3)_2$ were made to Cumberland clay loam soil in lysimeters, and the outgo of bases was studied over a period of 9 years. The replacements of Ca and Mg by Na were decidedly less than the reciprocal Ca-Mg replacements. Ca recovered from $Ca(NO_3)_2$ and exchanged by the Mg of $Mg(NO_3)_2$ were practically the same. Amts. of K replaced by heavy addns. of Na, Ca and Mg were small and indicated that K made available by ordinary amts. of nitrates would be inconsequential. M. S. ANDERSON

**Effects of various amounts of calcium carbonate on the degree of saturation of some Iowa soils with bases.** R. H. WALKER AND P. E. BROWN. *Proc. Iowa Acad. Sci.* **38**, *166-7(1931)*; *cf. C. A.* **26**, *3057*, *4406*.—Untreated Grundy silt loam was found to contain 9.30 milliequivs. (M. E.) of exchangeable H and 14.03 M. E. of exchangeable bases per 100 g. of soil in the base-exchange complex. Six months after the same soil had been treated with c. p. $CaCO_3$ at the rate of 6 tons per acre the exchangeable H content was only 1.15 M. E. and the exchangeable base content was 24.54 M. E. The $CaCO_3$ treatment, therefore, increased the degree of satn. with bases from 60.13 to 95.52%. In similar expts. $CaCO_3$ at the rate of 6 tons per acre increased the degree of satn. of Shelby loam from 63.82 to 100%, while $CaCO_3$ at the rate of 5 tons per acre was sufficient to increase the degree of satn. of Tama silt loam from 58.95 to 100%. W. G. GAESSLER

**Changes occurring in the irrigated soils as a result of irrigation, cropping and fertilizer treatments.** S. C. VANDECAVEYE AND L. C. WHEETING. Wash. Agr. Expt. Sta., *Bull.* **260**, 18(1931).—N fertilization alone, or in combination with P or K, gave

significantly increased apple yields at Wenatchee and Spokane. Continued use of fertilizers changed the soil reaction in several cases. Detns. of single or total exchangeable bases in Ephrata fine sandy soils show that very little exchangeable base is present, and it has little or no relation to crop yield or available plant nutrients. C. R. F.

**Arsenic toxicity in soils.** W. B. ALBERT. S. Car. Agr. Expt. Sta., *45th Annual Rept.* 44–6(1932); cf. *C. A.* **26,** 3600.—Addn. of $FeSO_4$ to As-toxic soils benefited subsequent crop growth. The red clay soils which are high in Fe have a much greater capacity to render arsenates nontoxic than have gray sandy soils low in Fe. When sol. As from $Na_3AsO_4$ was added to a dil. aq. suspension of $Fe(OH)_3$ and the mixt. was allowed to stand several hrs., As up to 0.6% by wt. of the $Fe(OH)_3$ was completely removed from soln. Larger amts. of As were not completely removed from soln. $Al(OH)_3$ was much less effective than $Fe(OH)_3$ in absorbing As. Lab. expts. showed that a mixt. of 20% red clay soil with topsoil or gray sandy soil would remove any concn. of As that might be encountered. This point was further confirmed by pot expts. with cowpeas. C. R. FELLERS

**Measurement of the free carbon dioxide in and above the soil at several of the bioclimatic stations in the Lunzer region.** P. LEHMANN. *Österr. bot. Z.* **80,** 98(1931); *Fortschr. Landw.* **7,** 46; cf. *C. A.* **25,** 2455.—Heavy rains caused a considerable and similar decrease in the free $CO_2$ content of soils under potatoes and barley. The distribution of $CO_2$ in the vertical layers of soil depends on the turbulence of the soil atm. A direct relation between the $CO_2$ content of the soil atm. and that of the atm. above the soil could not be established. The acid soils showed almost 100% higher values than the most strongly alk. soils of this region, rain strongly depressing the values in both cases. A method for *detg. the free $CO_2$ content of soil atm.* is described. K. D. J.

**The electrometric determination of chlorides in soils by the silver-silver chloride electrode.** E. F. SNYDER *Soil Science* **35,** 43–8(1933); cf. *C. A.* **23,** 2336, 5533.—A study is made of the application of the Ag-AgCl electrode to the detn. of Cl in soil suspensions and in soil exts The soils studied include 48 samples from 11 states and cover a wide range as regards texture and org. matter content. The $p_H$ values varied from 3.4 to 10.5 With only one exception there is good agreement between the results obtained by the Ag-AgCl electrode method, on the soil suspension and ext., and the $Ag_2CrO_4$ method on the ext. The advantages of the electrometric method are its rapidity and the elimination of the turbidity factor and the use of an indicator. M. S. A.

**Manganese contents of Latvian soils and rocks. Effect of manganese dioxide on the quinhydrone electrode. Manganese as an exchangeable base.** K. KRUMIŅŠ. *Acta Univ. Latviensis, Kim. Fakult. Serija* **1931,** II, [2].—In the soils examd., Fe is more readily sol. in HCl than in $HNO_3$, but Mn is equally sol. in the 2 acids, provided, in the case of $HNO_3$, org. matter is present. The difference between total and acid-sol. Fe is considerable and that for Mn small. During the aging of soils, leaching of carbonates is accompanied at first by an increased Mn content, followed later as the soil becomes acid, by the washing down of Mn from the surface layers The latter process is accelerated by the presence of much org. matter. Cultivated soils have higher Mn contents than forest soils. For the field detn. of active $MnO_2$ in soils, a measured vol. of soil in a tube is mixed with a definite proportion of benzidine. After the addn. of $H_2O$ and a few drops of dil. AcOH, the mixt is shaken and the color compared with standards. Active $MnO_2$ so detd. decreases with falling $p_H$ and is usually absent in soils of $p_H < 5$ and abnormally high in soils of $p_H > 8.5$. Peat soils with $p_H$ 3.5–6.7 and mineral content <70% show no benzidine reaction, and pos. tests are more rare in sandy soils than in clays and loams. Surface soils have less active $MnO_2$ than the nearest subsoil horizons $p_H$ values detd. by the quinhydrone electrode and colorimetrically may differ by 1–2 units where active $MnO_2$ occurs. At all reactions $>p_H$ 5.5 the quinhydrone electrode is liable to error. A close correlation exists between the $p_H$ of soils and the exchangeable-Mn contents. At $p_H$ >7.0 the amt. present is small, but increases rapidly with falling $p_H$. Anaerobic conditions and the presence of much org. matter probably tend to increase the proportion of exchangeable Mn. The Mn contents of certain trees and cereal crops is closely related to the $p_H$ and exchangeable-Mn contents of the soils in which they grow. On limed soils ($p_H$ 6.7–7.5) failure of red clover is assocd. with lowered exchangeable-Mn contents. A relationship between optimum $p_H$ ranges for the growth of certain crops, and the presence of exchangeable Mn or Fe is indicated. B. C. A.

**Determination of phosphate requirement of soils.** A. T. KIRSANOV. *Bull. Leningrad Dept. Inst. Fertilizers Agro-Soil Sci.* **38,** 31 pp.(1932).—Five g. of air-dried soil is shaken for 5 min. with 25 cc. 0.2 *N* HCl, allowed to settle for 15 min., and filtered. Five cc. of the filtrate is mixed with aq. $NH_4$ molybdate, and the whole is stirred with a Sn rod until a blue color is fully developed. The molybdate soln. is prepd. by dissolving 10 g. of the salt in 100 cc. of $H_2O$, warming, filtering hot, cooling and adding

200 cc. of concd. HCl (36%) and 100 cc. of water. For this detn. a dil. soln. (1:4) is used. The color is compared with a set of standards made with $CaHPO_4$. The method has been used successfully on podsolized soils in growing oats and barley, and a scale of indexes has been evolved: soils contg. 20 mg. or more in 100 g. of soil do not react to phosphate fertilizing; those with 8–20 mg. show medium reaction, while those with 7 mg. or less react readily. The method shows a correlation of 90% with field expts. on podsol soils. B. C. A.

**Relations between the reaction and root-soluble potash contents of soils.** L. SCHMITT. *Ernähr. Pflanze* **28**, 216–18(1932).—Neubauer tests indicate higher proportions of assimilable K in neutral and alk. than in acid soils. Soils of $p_H$ 5.5 are deficient in assimilable K as a result of the general depletion of exchangeable bases, including K, and the lowered adsorptive capacity. B. C. A.

**Relation of different degrees of decomposition of soil silicates to the amount and certainty of increases in yield [of crops], investigated on five typical varieties of soil.** F. HEISER. *Arch. Pflanzenbau* **7**, 468(1931); *Fortschr. Landw.* **7**, 127.—The best soils contain the largest amts. of complex, disintegrated, active silicates, capable of entering into exchange reactions. The fertility decreases in soils in which the silicate is present in the original, unweathered condition, or in which the end products of silicate weathering are $Al_2O_3$, $Fe_2O_3$ and $SiO_2$ in the form of opal or quartz. The degree of silicate decompn. is indicated by the amts. of zeolitic $SiO_2$, $Fe_2O_3$, $Al_2O_3$, etc., extd. from the soil by HCl. K. D. JACOB

**Determination of exchangeable sodium in soil.** M. M. GODLIN. *Contr. Ukrain. Inst. Soil Research* **3**, 91–3(1931).—From 10 to 25 g. of air-dried soil is wetted with 25–50 cc. of 0.05 *N* $H_2C_2O_4$, transferred to a filter, and washed with about 500 cc. of this soln. The filtrate is evapd. and the residue ignited. The carbonates formed are leached with hot $CO_2$-free $H_2O$, and the filtrate contg. alkali carbonates is again evapd with a few crystals of $H_2C_2O_4$ and ignited. Leaching, with successive evapn. and ignition, is repeated 3 or 4 times until all the residue dissolves in the 1st portion of $H_2O$. The mixed alkalies are detd. by titration with 0.1 *N* acid or sepd. by the usual methods. B. C. A.

**The evolution and rendering soluble of the elementary sulfur in arable soil.** G BERTRAND. *Compt. rend. acad. agr. France* **19**, 93–5(1933).—A brief résumé, particularly of the work of Guittonneau and Keilling (*C. A.* **21**, 2522; **24**, 5406; **27**, 548) J. R. ADAMS

**Thallium poisoning and soil fertility.** S. C. BROOKS. *Science* **75**, 105–6(1932).—No plant life was able to survive on patches of soil that received the rain that dripped from Tl-poisoned rodent bait. This effect lasted 2 years. E. L. GREEN

**The effect of various factors on the $p_H$ of peats.** M. M. MCCOOL. *Contrib Boyce Thompson Inst.* **4**, 497–511(1932); cf. *C. A.* **26**, 6049.—The effect of peats on the acidity and mineral content of soils varies with conditions. The $p_H$ value of a peat varies with the peat-water ratio; air drying increases the salt content of several peats; oven drying causes greater concn. of the soln. of peats; leaching and removal of sedimentary material decrease the H-ion concn. of acid peats; addn. of 0.1 *N* $Ca(NO_3)_2$ increases the H-ion concn. of peats, while less striking results were obtained with 0.1 *N* KCl, $KNO_3$, $NH_4Cl$, $NH_4NO_3$, $(NH_4)_2SO_4$ and $NaNO_3$. Phosphates reacted similarly. Powd. S was oxidized to an acid difficultly removable by leaching. S lowered the $p_H$ values of peats. N. M. NAYLOR

**Experiments to determine the retentive powers of Aroostook potato soils for nitrogen.** ELMER R. TOBEY. Maine Agr. Expt. Sta., *Bull.* **360**, 187–8(1932).—Equiv amts. of N from $(NH_4)_2SO_4$, $NaNO_3$, $KNO_3$, Amm-phos A and urea were percolated with soil and leached each week with $H_2O$ equiv. to 1 in. of rainfall. Twenty-four successive leachings were made, and the exts. were examd. chemically for nitrate and $NH_4$. The ext. from the first leaching of the $(NH_4)_2SO_4$ contained 70% of its N as ammonium N, that from Ammo-phos A 47% and that from urea, 23%. Urea showed 47% of its N present in the first leaching as org. N. The amts. of ammonium N in the exts. from the $NH_4$ salts and urea rapidly decreased until none was found in the seventh leaching. The N from $(NH_4)_2SO_4$, Ammo-phos A, and urea is rapidly converted in the soil to nitrate N. The $NaNO_3$ and $KNO_3$ leached rapidly from the soil even at the first leaching. The largest amts. were removed at the 5th to 7th leachings. The amt. of urea removed increased gradually up to the ninth leaching. Ammo-phos A was similar in action though slower than urea. The total amt. of N removed by the leaching effect of $H_2O$, equiv. to 24 in. of rainfall, is equal to the following percentages of the amt. of N added in the form of the salts: $(NH_4)_2SO_4$, 60.19; $NaNO_3$, 88.58; $KNO_3$, 86.58; Ammo-phos A, 78.58; and urea 82.12. C. R. FELLERS

**Short note on the catalysis of biological nitrogen fixation.** H. BORTELS. *Zentr.*

*Bakt. Parasitenk.*, II Abt. **87**, 476–7(1933); cf. *C. A.* **26**, 2481.—The elements Mo and V act as catalyzers in N fixation. JOHN T. MYERS

**Nitrate assimilation by soil bacteria.** F. B. SMITH AND DOROTHY SCHLOTS. *Proc. Iowa Acad. Sci.* **38**, 289–91(1931); cf. *C. A.* **24**, 1175; **25**, 4078; **26**, 6047.—It is concluded from results secured in a study of some nitrate-assimilating organisms isolated from soils in which the nitrates had recently disappeared that certain soil bacteria may assimilate large quantities of nitrate N under favorable conditions of moisture, temp. and food supply. A short bibliography is appended. W. G. GAESSLER

**Nitrifying efficiency of soils.** JUAN G. TUCAY. *Philippine Agr.* **21**, 551–9(1933).—The nitrate-N content of the soils varied with the $H_2O$ content. The highest content corresponded with a period of medium rainfall Applications of $NH_4H_2PO_4$ and $(NH_4)_2SO_4$ resulted in a large increase in the amt. of $NO_3$ present, but applications of $NH_4Cl$ had no significant effect. The $p_H$ varied from 5.62 to 7.14, and in these expts. there was no observable correlation between soil reaction and nitrifying power. Thirty references are appended. A. L. MEHRING

**Nitrification studies of certain Philippine soils.** DIONISIO I. AQUINO AND VEDASTO I. JAVIER. *Philippine Agr.* **21**, 309–17(1932).—Nitrification was studied in 18 different soil types. The N content originally present varied from 0.02 for the Macolod clay loam to 1.25% for the Calumpang clay loam. Thirty mg. $(NH_4)_2SO_4$ added to 100 g. soil increased the nitrate N greatly in every case, with a max. of 4.22%. Addns. of $(NH_4)_2SO_4$ and $CaCO_3$ together increased the nitrate N still more in every case. A. L. MEHRING

**Some nitrification studies on an alkali soil in Iowa.** SANFORD M. SMITH AND F. B. SMITH. *Proc. Iowa Acad. Sci.* **38**, 327–31(1931); cf. *C. A.* **25**, 1019, 1021, 4080.—Results show that org. materials are superior to inorg. fertilizers in reducing the production of nitrates in certain alkali soils in Iowa. With straw there was the lowest production of nitrates, with sweet clover the second lowest and with fertilizer the third lowest production. There did not appear to be much difference between the effects of gypsum and KCl. Alkali soils are very favorable for nitrate production. W. G. GAESSLER

**Anaerobic nitrogen fixation in some Iowa soils.** W. HILLMAN WILLIS AND R. H. WALKER. *Proc. Iowa Acad. Sci.* **38**, 293–8(1931); cf. *C. A.* **24**, 5915; **25**, 1020, 4078.—There are comparatively large nos. of anaerobes in certain acid soils in Iowa and they may play an important role in the process of N fixation in these soils either in conjunction with aerobes in slightly acid soils or acting alone in strongly acid soils. A short bibliography is appended. W. G. GAESSLER

**Experiments with the Winogradsky spontaneous culture test on Iowa soils.** ARTHUR W. YOUNG AND R. H. WALKER. *Proc. Iowa Acad. Sci.* **38**, 313–20(1931); cf. *C. A.* **25**, 1020.—The Winogradsky spontaneous culture test as heretofore employed is not entirely suited for the accurate detn. of plant-food deficiencies in Iowa soils. It may be possible to modify the method so that the plant-food deficiencies of these soils can be detd. with reasonable accuracy. A short bibliography is appended. W. G. G.

**Nitrogen fixation in some Michigan soils.** L. M. TURK. Mich. Agr. Expt. Sta., *Quart. Bull.* **15**, 183–90(1933).—Mich. soils contain an active nonsymbiotic N-fixing flora. The Brookston soil is most active in this respect. Fixation is greatly increased upon the addn. of org. matter (particularly legumes), CaO, P, K and combinations of these factors. The addn. of alfalfa greatly stimulated fixation especially when supplemented with CaO or $CaCO_3$ in acid soils. Though the data are not conclusive, it is believed that the anaerobic N-fixing bacteria are of considerable importance in Mich. soils. It is believed that 20–50 lb per acre per yr. of N is added as a result of nonsymbiotic fixation by bacteria. C. R. FELLERS

**The effect of phosphorus on nitrogen fixation by Azotobacter.** L. G. THOMPSON, JR., AND F. B. SMITH. *Proc. Iowa Acad. Sci.* **38**, 299–302(1931); cf. *C. A.* **25**, 5728.—These results as a whole seem to indicate that large amts. of P are not assimilated by *Azotobacter* and hence are not necessary for their growth. The beneficial effects of large amts. of phosphates, therefore, are probably due to their buffer action which aids in maintaining a more favorable reaction condition for the growth of the organisms. W. G. GAESSLER

**Aspergillus niger as an indicator of available phosphorus in the soil.** F. E. SCHLOTS, F. B. SMITH AND P. E. BROWN. *Proc. Iowa Acad. Sci.* **38**, 303–7(1931); cf. *C. A.* **24**, 2823; **26**, 4668.—From a comparison of the results of the *Aspergillus niger* method with those secured by the Truog method (cf. *C. A.* **25**, 160) as shown in 2 graphs, there seems to be a rather close correlation, and as a general conclusion it may be said that *Aspergillus niger* indicates changes in the availability of P in a soil; the method may
